## LOCAL SANITATION.

IN the lengthy reports of the Committee of the Yokohama Board of Health, published in another part of this paper, there are, apart from the general interest of the subject, many matters which call for the earnest attention of foreign residents. Although there may not, at present, be great occasion for extraordinary precaution, yet it is well to be always prepared to meet the incursion of any possible foe. At some future date, when the conditions precedent of seismic disaster have been approximately arranged and tabulated by the observers of earthquake and volcanic perturbations, dwellers on this sphere will, perhaps, be enabled, after due warning, to select and flee to the nearest spot affording conditions of comparative safety, provided distances are not too remote. Epidemic disease has, no doubt, destroyed more victims than have been annihilated by earthquakes; but it is less astonishing in its results and more within the scope of scientific investigation. It has, so far, been found easier to trace the course of a pestilence, and to gain experience of the best methods to be employed against the onslaughts of its successors, than to determine the origin of an ærolith or the exact centre of the motive power which creates an earthquake. On the whole, sanitation is a more useful science than seismology. The one teaches instantly how moderate precaution may mitigate or prevent the evils of disease: the other has at present little to offer except the vaguest presumption of infinitesimal possibilities of strife with a power which does not only attack mankind but makes successful war upon nature and all her works.

In view of the possibility of any future recurrence of such an epidemic as that which, first appearing in Japan in 1877, lingered through 1878, and achieved its highest development in 1879,—last year,—when it carried away one hundred thousand persons,—the observations of the local sanitary authori-

ties, and the deductions which they made, merit some consideration. The hygienic work set on foot when cholera first made its appearance has been carefully developed, until now the sanitary system for the whole empire, and especially for the great centres of population, such as Yokohama and Tokio, leaves little to be desired; and will compare favourably with that carried into effect in many states of those Western regions whence it has been copied. No plan could be much more perfect than that adopted by the authorities of this particular ken last year, with their mode of inspection, purification, disinfection, stoppage of foul and provision for pure water-supplies in infected localities. With these measures, however, the reports now published deal, if at all, only cursorily. Their object is principally to indicate certain conditions discovered injurious to the public health, and to suggest how they may be obviated.

It is now an axiom of medical science, that contamination of the water supply is a primo cause of the propagation of zymotic disease. Not only in the portions of the town occupied by Japanese and Chinese, but in the foreign settlements in Yokohama and on the Bluff, were the wells examined by the Commission found, in many instances, to be loaded with impurities, the introduction of which might easily be avoided. A common and almost universal practice of Japanese servants, unless they are peremptorily dissuaded from it, is to wash themselves, their clothes, and everything else on the platform of wood or stone which surrounds the mouths of the wells. Hence vestiges of all kinds of uncleanness, and perhaps the germs of disease, percolate into the water-supply of considerable numbers of people. It is earnestly recommended that the not too difficult measures to prevent the discontinuance of this habit should be adopted. All other suggestions made by the Commission are of equal facility in execution. It should be no great trouble or expense for a householder to have brick or cemented ash-pits constructed wherein to deposit the refuse of the establishment, or to see that the drainage is sufficient for the health and comfort of himself and family, or that the cleanliness of the outhouses is properly maintained, and free access accorded to those on whom the discharge of the work of scavenging devolves. Not only should the position of the well be properly selected with regard to other necessary places; but the well itself should be taken care of. The wooden tubes which line it should, as occasion demands, be renewed; and the use of clumsy and constantly rotting straw ropes should be discontinued. All drains, sewers, and receptacles for matter out of place, should be made as nearly as possible impermeable. This is about the sum and substance of the counsel tendered by the Committee to foreign residents who desire to keep their own houses and surroundings in a state of healthy cleanliness, and so to subserve their own comfort, health and enjoyment. The hints given to foreigners ought to be sufficient in this respect to attain the result desired. There are other matters, such as the ventilation of tea-firing godowns, and the erection and maintenance of suitable and comfortable abodes for the domestics attached

to foreign houses, which should not be, and probably will not be, disregarded. For the moment it is scarcely necessary to say more than that it will be well for residents to read carefully the reports presented, to make the obvious inferences, and to act accordingly.

### FOREIGN TRADE IN CHINESE TREATY PORTS.\*

IN an article in the *Japan Weekly Mail* of the 17th of April, we dealt generally with the statistics of the whole foreign trade of the empire. The remainder of the volume before us is devoted to the reports of the year's transactions from the various Commissioners-in-charge at the ports, to the Inspector-General at Peking. We have thus information from eighteen of the nineteen ports open to foreign commerce, that from Tientsin alone being absent; and very well written and exhaustive documents they are as a rule. Any notice which we can give of them must necessarily be cursory and deal only with the most salient points. The first communication we meet with is that from Newchwang. Mr. Hughes remarks that, unlike the provinces of Shansi, Shensi, and Honan, where recurring famines and dire distress have afflicted millions of human beings, the three Manchurian provinces and part of South-eastern Mongolia, which are the consumers of its imports and producers of its exports, have been enriched by several years of abundance in the yield of the fruits of the earth. Enormous indeed must be the capabilities of a district which could send away in one season 7,974,328 piculs of grain, without producing any perceptible effect upon the supplies required for the subsistence of sixteen or seventeen million souls forming its domestic population. Of the vast export here mentioned a quantity went to Tientsin, in aid of the people of the famine-stricken provinces. The greater part, however, was despatched to other Chinese ports and Hongkong in the ordinary course of trade. Values were raised locally to the advantage of the agricultural classes, who bought foreign imports freely. The trade in the latter articles, notwithstanding a decrease in their selling values and in a most satisfactory diminution in the importation of opium, exceeded, by the large sum of *Hk. tls.* 1,000,000, that of 1877, the year of previously highest valuation. A still larger increase in exports is noted.

Coming, however, to matter of more particular interest, we have the substantial statement of this impartial Custom House Commissioner, dealing with figures that cannot lie, of the extent to which the adulteration of British cotton cloths has injured their reputation and sale in so important a commercial centre as Newchwang. Mr. Hughes says, that the effect of the deterioration "has tended to the greatly increased popularity and demand for American fabrics, which are undeniably superior to the English manufactures in purity, durability, and warmth, qualities justly appreciated by Chinese consumers; and they command relatively higher prices than the English article." And then a table is given which conclusively proves to what extent the policy of Manchester manufacturers has been suicidal. The tabulation for three years is as follows:—

	1876.	1877.	1878.
English Drills and Jeans, <i>Pieces</i>	197,405	90,825	154,771
American " " " "	86,522	74,880	212,065
English Sheetings.....	1,800	2,550	19,375
American " " " "	3,760	24,035	74,670

Thus in 1878, as compared with the average quantities imported in 1876 and 1877, English drills and jeans have only increased 10,906 pieces, while the American fabrics have

increased 131,864 pieces. English sheetings have only increased 17,200 pieces against an augmentation of 60,773 pieces of American cloth. The importation of native stuff and raw cotton is considerable. Of the manufactured material 264 piculs were brought in foreign vessels, and 161,000 piculs in junks, the latter total being the equivalent of 2,800,000 pieces of the Manchester manufacture. It is best to look at any subject in its true light, so before going further we will refer to other comparative statistics of English and American trade with China in cotton stuffs. At Chefoo in 1874, drills of the former make were imported to the extent of 21,815 pieces: in 1878 the import had fallen to 14,673. The corresponding figures for the American trade are, in the same years, 6,173 and 58,165. No returns of English sheetings are given for this port. America, which in 1874 supplied only 1,060 pieces, had in 1878 increased the trade to 59,957 pieces. At the great entrepôt of Shanghai, affairs for four years are thus stated

YEAR.	ENGLISH.		AMERICAN.	
	Drills.	Jeans.	Drills.	Jeans.
1875.....	539,969	483,644	125,311	2,001
1876.....	934,352	229,966	202,340	8,520
1877.....	606,098	292,629	269,984	22,573
1878.....	555,670	114,946	420,824	22,203

Mr. James H. Hart, the Commissioner in charge, says; "In connection with this table, it may not be out of place to remark that, in 1861, 403,638 pieces American Drills were imported. The civil war that broke out at that period in the United States brought the importation down to 2,738 pieces in 1865, so that country may now be said to have regained the position as regards this fabric that it held seventeen years ago." For Foochow exact figures are not given; but the Commissioner-in-charge there says that in drills, of American as well as British manufacture, the experience is that one and the other are steadily and even rapidly declining in the estimation of the natives, a fact which is ascribed partly to the high appreciation for durability which is being established by native fabrics, and partly to the curious circumstance that several descriptions of foreign piece-goods, drills among the rest, which formerly entered the port under their proper name, now find their way thither, after a transformation at Swatow, in the shape of dyeing and cutting into suitable lengths, as native cloths. The report for Swatow, referring to this new industry, says that white shirtings of the Manchester make are preferred by the dealers of Chaodlow-fu for their peculiar purposes. The cloths are dyed blue and then re-exported to other Chinese ports as native tissues. Hence the increase in the import of the original shirtings has been from 25,507 pieces in 1869 to 145,695 pieces in 1878. Mr. Huber, the Swatow Commissioner, remarks, in this connection, that, although the Chaodlow-fu dye is increasing in favor ever year, it is strange that the industry has been able to compete so successfully with similar enterprises in the North of China, considering the heavy duties levied on the white shirtings thus dyed. He hears, however, that some of the dyers are now contemplating the removal of their dyeing establishments to Hongkong or even to Shanghai, which latter place is by far the largest market for the converted goods. Two heavy duties would be evaded by the alteration spoken of. But, returning to the comparison of English and American cotton material sold in China, there is ample evidence to show that the sale of the former is considerably declining, while that of the latter is augmenting—a fact which should stimulate British manufacturers to exertion in order not only to lose no further ground but to recover that which they have lost.

Respecting opium, the Newchwang report says that the importation of the drug during the last eight years has been

\* Imperial Maritime Customs. 1.—Statistical series: No. 4. Reports on trade at the Treaty Ports, for the year 1878. Published by order of the Inspector-General of Customs.

steadily declining. In 1870, 2,448 piculs; in 1874, 1,827 piculs; in 1875, 892 piculs; and in 1878, 1,223 piculs. We read that, in spite of constant proclamations against its growth, the poppy is largely and extensively cultivated in the plains of Central Manchuria, and South-eastern Mongolia. It has thriven and become an important industry to such an extent that native opium will in all probability eventually displace the Indian staple in the Newchwang market, and become a recognized article of export to other parts of the empire. *O nimium fortunatos, si sua bona norint!* It is not because the poppy is a more remunerative crop than "beans or grain," that the peasantry of the most fertile portion of the Middle Kingdom should rely on its cultivation. An instance of what may be produced by such a course is found in Malwa, which grows the drug that is in greatest favour in China. Its name signifies "the land of plenty"; but its inhabitants regard the North-west provinces of India as more deserving the appellation. In their own land, while the poppy is plentiful, grain is scarce, and the necessities of life are at enormously high prices. A recent traveller in Hindustan speaks of the enormous quantities of grain which he encountered on the road into Malwa. Shanghai is of course the great depôt for the receipt of opium, and its distribution among the districts of North China. For its own local consumption it took, in 1878, 15,684.66 piculs, valued at the sum of *Hk. tls.* 5,904,935, showing a considerable increase over the quantity consumed in either of the two previous years. It re-exported 31,948.98 piculs, with the experience that, except at Newchwang, the demand for foreign opium had increased at the northern and river ports during the year.

Among the exports silk and tea of course figure in first prominence. For buyers of the former staple the year was less disastrous than some of its precursors, but was far from satisfactory, while operations in the leaf were most unfortunate, and the experience of China may be applied elsewhere. Mr. Hart writes:—"The Tea trade during the past season has been one of the most disastrous experienced for years. With but few exceptions, purchases have resulted in serious loss, and unless the utmost caution be observed in future operations there can be little prospect of a change for the better. Every year the competition between the foreign buyers to secure early shipments seems to increase, and when this competition has to contend against combination on the part of the sellers, the competitor has to pay dearly—too dearly—for the part he takes in the transaction. Why this system has gone on so long, and why it continues to be the practice in spite of the bitter experiences of each succeeding year, is a matter of wonder to the non-trader. It is to be presumed that those engaged in the trade have good reasons to guide them in their operations; but, bearing in mind the depressed and unsatisfactory condition of the tea market during the past few years and the heavy losses sustained, it would be interesting to know the basis on which the purchaser in China makes his calculations."

A considerable decrease from year to year since 1874 is recorded in the export of tea from Shanghai, a deficit which, it is said, is counterbalanced by larger direct shipments from Hankow and Foochow; so that, on the whole, the quantity of the leaf exported from China during the past year, while less by some ten thousand piculs than the shipments of 1877, was yet much in excess of the quantity exported annually prior to that year. It cannot be doubted, however, that the Chinese tea trade with Europe must suffer considerably from the increasing competition of the Assam leaf, while Japanese rivalry in the United States has seriously injured the chance of the product of the Celestial Empire in that direction. There remains much to interest and in-

struct in these reports, which are well worth the perusal of all these interested in the trade of China. Further, they invariably reflect credit upon the authors, and testify to the remarkable perfection of organization to which, under the able directorship of Mr. Robert Hart, the whole service has been brought.

#### A PLAGIARISED JAPANESE-GERMAN LEXICON.

WE have recently met with a work entitled, *Woerterbuch der Japanischen und Deutschen Sprache durchgesehen von Herrn R. Lehmann, Lehrer an der deutschen Schule in Kioto. Tokio, 1877.* (Japanese-German Dictionary, revised by Mr. R. Lehmann, teacher in the German school at Kioto). On taking up this book, which contains 1,098 pages, royal octavo, one wonders why "the authors,"—as the preface is signed,—should be so modest as to withhold their names from what at first sight appears to be a very complete and elaborate work, which it must have taken years to compile. It also seems strange that the words should have been arranged, not alphabetically, but according to the *I-ro-ha*; for the circumstance that many exactly similar sounds are spelt differently in the *Kana*, must always render any consistent arrangement of the kind utterly impracticable. This objection "the authors" have tried to meet by leaving out five *Kana* characters, #, オ, 二, ヲ and ㇿ, and giving words, that should be written therewith, under イ, ナ, 二, ㇿ and ヲ; and in a similar way the longer *Kana* combinations are disposed of, for instance, by giving words with テウ under ナ, ヲウ under ト, etc. One naturally asks, why such a halting system has been preferred to an alphabetical arrangement like that found in Dr. Hepburn's dictionary, the more so, as it is a fact, that even Japanese, in cases where words are written in Roman letters, find it much easier to handle the alphabet than the *Kana*? A natural curiosity leading us to compare the information found in the new dictionary with what was given us five years ago in the second edition of Hepburn's dictionary, we find, to our great astonishment, that the German work contains nothing but a verbatim translation of the aforesaid Japanese-English dictionary. Taking some instances at random we find under the word *ya*:

##### Hepburn's Dictionary

A particle of interrogation or doubt, having the same meaning as *ka*, but weaker and more gentle; as *Ikaga sen ya*, What shall I do? *Yukan ya kayeran ya*, Shall I go or shall I return? *Ari ya nashi ya to to*, To inquire whether he has or not.

2. Used also as a simple exclamation or pause, in enumerating several things; or as an accent, similar to *yo*; as *Hana ya chô ya*, The flowers and butterflies. *Ko-ya ya*, or *Osuoshi ya*, How dreadful! *Oira ja nai ya*, It was not me.

3. As an imperative particle; as *Shuime ya*, Advance. *Koko ge ki ya*, Come here. *Itte kikase ya*, Tell me.

##### German Dictionary

1. Eine fragende Partikel, welche dieselbe Bedeutung hat wie *ka*, aber schwächer und vornehmer ist; z.B. *Ikaga sen ya*, Was soll ich thun! *Yukan ya kayeran ya*, Soll ich weiter gehen, oder soll ich zurückkehren? *Ari ya nashi ya to to*, Ich frage ihn, ob er es hat oder nicht.

2. Eine Interjection oder beim Aufzählen verschiedener Dinge als trennende Partikel gebraucht; es dient auch um Nachdruck auf ein Wort zu legen, ähnlich wie *yô*; z. B. *hana ya chô ya*, Die Blumen und Schmetterlinge. *Ko-ya ya*, oder *osuroshi ya*, Wie fürchterlich! Wie schrecklich! *Oira ja nai ya*, Es war nicht ich! Ich war es nicht!

3. Als ein befehlende Partikel; z. B. *Shuime ya*, Rücke vor! Gehe weiter! *Koko ge ki ya*, komm hier! *Itte kikase ya*, Sage mir!

It will be seen that a more literal translation could hardly be given; the small discrepancies that may be found consisting either in the substitution of incorrect expressions for correct ones, as *too* for *to*, *yô* for *yo*; or synonymous and superfluous double translations of Hepburn's original term, as "Wie fürchterlich!" "Wie schrecklich!" for "how dreadful"; "Es war nicht ich," "Ich war es nicht," for "it was not

me." Even where, quite exceptionally, an erroneous or unfortunate expression is used in Hepburn's dictionary, "the authors" faithfully adopt it. Thus both dictionaries in the passage given above have *osoroshi*, while it should correctly be *osorashii*. One is almost taken aback by the unexpected energy and originality displayed by "the authors" in rectifying the misprint *ge* for *ye*, which in Hepburn's dictionary is found under the same word *ya*. Some amusing instances occur of misunderstanding, on the part of "the authors," of expressions used by Dr. Hepburn, and consequent mistranslations. Thus in the passage given above, Hepburn defines *ya* as having the same meaning as *la*, "but weaker and more gentle." This last word the Japanese-German dictionary translates as *vornehmer*. It is quite true, that *gentle*, if meaning "well born," is in German "*vornehm*;" but in its sense of "mild," in which, of course, it should be taken here, it must be rendered by the German "*sanft*" or "*milde*."

Having satisfied ourselves that the same similarity exists throughout the book, which altogether hardly contains a dozen expressions varying from Hepburn's, or the same number of new words,—although owing to the rapid development of the language it would have been easy to add hundreds,—we turn again to the title page and preface to see if there is no acknowledgment whatever, of the book being but a translation of Hepburn's work. We find no such confession, but, on the contrary, meet with a cursory remark towards the end of the preface, stating that the authors "have taken Hepburn's dictionary as a model," which would distinctly indicate that the work, except perhaps in form, is an independent production. Had "the authors" really compiled a new dictionary, and published it, like Hepburn's, in alphabetical order and with his system of spelling, they might have called it a work "on the model of Hepburn's." But to translate word for word what he has written, and for the sake of making this fact less apparent, to arrange the words in a way entirely different to his, and then to publish the whole anonymously as an independent compilation, is not what we should call "to take as a model," but an act which we should, more appropriately, style "piracy." We must add that we learn, upon inquiry, that Dr. Hepburn's permission for the translation was never asked, nor was he in any way advised of the appearance of the book, either before or after its publication.

We have thought it our duty to go fully into this matter, as we consider it of importance that the Japanese should be taught how foreigners look upon undertakings of this kind; and in conclusion we must add that, while we now quite well comprehend why "the authors" should have refrained from giving their names, we cannot understand that Mr. Lehmann should have lent his assistance or name to a publication which is nothing but a most barefaced plagiarism.

#### DR. SIEMENS AND MR. EDISON.

IN an article published in this journal two months since on the Electric Light, we referred to "the complete, utter, and disastrous failure" of Mr. Edison in his attempts to utilize electricity as an illuminating agent, adding, that not a single step forward had been made in the supplanting of gas in private houses, for domestic purposes, or for the lighting of ordinary streets. Our assertion has since been strongly confirmed; and some German newspapers recently received here contain a long letter written by Dr. Werner Siemens, the celebrated electrician of Berlin, to a gentleman who had forwarded to him the accounts of certain reporters who had "interviewed" Mr. Edison, and examined his establishment at Menlo Park. These reports have raised Dr. Siemens's ire.

He says that they give him cause for serious complaint. With his concurrence, certain communications respecting the lighting of one of the thoroughfares of Berlin (known as the "Passage") by means of his differential lamps, have been published; and he claims, therefore, that the problem of dividing the electric current was first solved by his firm. The statement of the correspondent that this feat was accomplished by Edison is, Dr. Siemens says, not only untrue, but hostile to German industry in general. He indicates how many important interests suffer from the senseless reports trumpeted over to Europe from time to time, of new inventions in America. "Edison, it is well known, is provided with funds for working at the electric light by a financial company. If the shares of this company fall too much, an interview with a reporter is published, which foretells the end of all gas companies in the near future. Then gas shares in Europe and America fall rapidly, and the rest can be well understood, without any further observation on the subject." Dr. Siemens then goes on to shew that many of Edison's experiments for producing a steady continuous light, have long since been tried by others, and found wanting. Thus, several months ago, the light of incandescent platinum wire was blazoned forth; while every one who understood the subject knew perfectly well that platinum is fusible under great heat, and that it is not suitable for producing light. This went on for a time. Now, light from incandescent carbon is again brought on the scene, and in this connection it is conveniently shewn that platinum as a medium for the electric light is a failure. "For many years, and in many ways, people have endeavoured to produce a constant incandescence by placing pieces of carbon in a vacuum, and conducting an electric current to them. A Russian company was formed for this purpose, and after its bankruptcy a second started with the same result. Carbon, like platinum, is not sufficiently lasting." But these well known facts, Dr. Siemens states, the Edison correspondents persistently ignore. It is quite possible that an untiring, talented—albeit not very instructed—experimentalist like Edison, may find some simple means of partly obviating the want hitherto felt in these lights; but a mere slight modification of known methods cannot be properly termed an ingenious invention; and to this extent and no further Edison's services in the matter have hitherto been wholly confined. The machine he uses for generating electric currents is a dynamo-electric one of Dr. Siemens's own invention, although, as we will point out presently, he attempted, in the first instance to make use of a machine, for the invention of which he was entitled to all the credit (if any) attaching to its discovery. The electro-dynamometer is in principle a discovery of Weber and was brought by Dr. Siemens's firm to a state of perfection which rendered it capable of bearing a strong electric current. It has now been used by them for nearly twenty years for the purpose of measuring such currents. Edison's reporter, however, attributes both inventions to his hero. "I do not," Dr. Siemens concludes, "take this ill of Edison himself; for he is a go-ahead American inventor, who has had neither time nor opportunity to instruct himself, and whose object is to make money rapidly. But that European journalism, true to the principle that nothing can be good that does not come from a distance, should, without examination, lend itself as an organ to assist in this manoeuvre, is truly saddening. To Edison himself, this bolstering up of his inventions by journalism will be injurious. This is to be regretted, as he cannot be denied talent, although his really useful performances have as yet been extremely few.

It is positive poison for an invention to be too early and too rapidly thrown on the public market. The rebound does not last, and destroys the uncovered kernel, which requires peace and time to germinate. I make it a point, personally, to come as little as possible in contact with publicity. Really useful works soon find their path and their recognition."

This communication of Dr. Siemens is eminently characteristic of a true and modest scientist in contradistinction to the rapid boasting of a pretentious charlatan. The renowned German electrician says little of his own well-recognized discoveries in the wide fields of electrical research, and mercifully refrains from pointing out, in detail, any of the magnificent inventions (so-called) of Mr. Edison. Dr. Siemens might well have dilated upon the dynamo-electric machine of the "Magician of Menlo Park" which the latter has styled, in pompous language, the "Faradaic machine," although it merits this title only in virtue of its representing a state of knowledge more nearly of Faraday's time than that which has perfected any machine in use at present.

A description of this truly extraordinary piece of mechanism appeared in an American scientific journal. Coils are fixed to the vibrating arms of a monstrous tuning-fork more than a yard long; and these, by the vibrations of the fork, are made to approach, or recede from, magnets; and thus currents are generated. It is hardly necessary to add that this practical proof of ignorance of either electricity or the science of energy was found entirely useless, but—and this is almost the strangest part of the story—not until a patent for it had been actually taken out. A return to the dynamo-electric machine of Dr. Siemens was the natural and inevitable result of the collapse of the exaggerated tuning-fork, although Mr. Edison is dubbed the inventor of the apparatus he now employs. As has been aptly remarked, Mr. Edison's pretentious announcements are as little justified by the fact that he has satisfied himself as to the best form of carbon to use in the ordinary and well-known incandescent method of electric lighting, as a candle manufacturer would be justified in announcing that he had completely solved the problem of domestic lighting because he had devised a slightly improved candle-wick.

We think that Dr. Siemens's remarks relative to European journals accepting with eager credulity the announcement of inventions from afar, are altogether too general and likely to lead to error. The actual offender in the present instance was the *Times*; and, relying upon the reputation of that journal for securing accurate information, many newspapers followed its lead without having first made due inquiry into the actual facts. The action of "the Thunderer" in this matter has provoked much comment and severe censure, more especially as experience quickly proved that the correspondents who furnished those extravagant accounts of Mr. Edison's triumph which appeared in the *Times*, were either gulled to an extent that is hardly credible, or were influenced by outside considerations which not unfrequently play a prominent part in matters of the kind. No reason is there for surprise that, as one of these gentlemen has recorded, Mr. Edison "hates electrical experts." A thorough investigation by competent people would have long ago burst the bubble blown by the "Magician of Menlo Park," and rendered impossible those raids upon the property of shareholders in gas companies so artfully contrived and successfully carried out by the unscrupulous schemers who, for their own nefarious ends, use the reputation built up for Mr. Edison by credulous or mercenary reporters.

PROFESSOR Morse's paper on "Dolmens in Japan" in the current number of the *Popular Science Monthly* is little more than a brief description of certain chambers in the low range of hills between Osaka and Nara. The word dolmen is derived, it is said, from "Dane" a table, and "Maen," a stone, and is used to denote all ancient stone-chambers. It is doubtful whether those described in Professor Morse's paper were burial-places, as he seems inclined to believe; for, apart from their great size,—fifteen to twenty feet high, and fifty to seventy-five feet in diameter, with passage ways in some cases twenty-eight feet in length,—it is known that cave-dwellers formerly existed in Japan. In Mr. Milne's paper on prehistoric remains, published in a recent number of the *Transactions of the Asiatic Society of Japan*, a *précis* is given of a Japanese work on caves and cave-dwellers. These latter are said to have lived in holes which they dug in the sides of the hills; and references to rock caverns in which people dwelt are found both in the *Kojiki* and the *Manyôshû*, as well as in various other works. It is also stated in the paper from which we quote that, down to the time of Emperor Tenbu Tennô, (673-686 A.D.) caves were dug by the Japanese as bed-rooms and dwelling places. The marks of fire found in one of the caves would go to show that they were dwelling rather than burial places. Every reader who has travelled much in the interior of Japan, will have his own opinion as to the correctness of Professor Morse's remark that Japan is under a state of almost universal cultivation. Another point respecting which there appears to be some misconception in the writer's mind is found in the following passage:—"At the entrances of towns, one often sees two large mounds between which the road runs. Each mound is often surmounted by a large tree." These mounds have nothing whatever to do with archæology. They are merely intended to mark the river—in fact to fulfil the same function as our milestones—and are still to be seen in some parts of the country in a perfect state for many miles. But, as a rule, they are rapidly disappearing.

AT a meeting of the Seismological Society, held in the Tokio University on Monday afternoon last, Professor Milne delivered the opening address. He dwelt on the wide field open to inquirers in the study of earthquakes and volcanoes, as well as their concomitant phenomena; he shewed the practical advantages which would result from such a study, especially to the working geologist, and then reviewed the work which had already been done in Japan, at the same time comparing it with the labours of Perrey, Mallet, and others in different countries. The latter portion of the paper described the work in progress, including the establishment of stations at intervals on the great Tokio plain for the observation of earthquake phenomena. This is being undertaken with the assistance of the Japanese Government. In conclusion, Mr. Milne indulged in certain speculations respecting the foretelling of earthquakes. He thought it possible that this could be done by observations over active seismic areas, either by the observation of earth temperatures, which would indicate contraction or expansion of the rocks of that area, or by the observation of earth tremours. Another method of forewarning ourselves would be by suitable telegraphic communications; a shock passing one point being caused to fire a gun in a district many miles distant. We fear that this ingenious contrivance would too often prove of the same nature as the intimation known among sea-faring men as "Scarborough warning," which consists in a cry of "stand from under!" after you have been knocked down by a block or other nautical contrivance. Mr. Ewing described an instrument for measuring the intensity of earthquakes, which he claimed to have invented. A discussion followed, in which the chief question seemed to be, whether a heavy

weight suspended at the end of a long, thin wire, was effected by the motion of the earth's surface or not. This seems a question which could be very easily answered in any of the more violent shocks that have recently visited the capital. Although not deeply interested in the construction of these instruments, we venture to say, upon the ocular evidence of trustworthy witnesses, that during a recent earthquake such pendulums did move occasionally through a space of from nine inches to a foot; and if they move proportionately in heavier disturbances, they must prove, unless great improvements are made in their construction, utterly useless as earthquake records. In fact, we wish to the future of scientific seismic and volcanic investigation more satisfactory results than we can venture to think will be attained. The illustrious elder Pliny was not happy in his attempt to observe the circumstances of the eruption of Vesuvius in 79 A.D.; and Mr. Palmieri seems to be courting the fate of the old naturalist and geographer. After all, Empedocles was the most intrepid explorer of volcanoes on record; and by-and-by, perhaps, some of our modern physicists may know as much of the subject as he does. Mr. Hattori, of the Daigakko, was elected president for the ensuing year. The next meeting of the society will, it is stated, take place in Yokohama.

IN the *Japan Weekly Mail* of the 17th ultimo, we published an article from the *Times* on the Sanscrit book which has lately been discovered in Japan, and forwarded to Professor Max Müller, by whom it was brought to the notice of Orientalists. We commend to the attention of specialists that part of a paper in this issue of our review, descriptive of the Hakubutsukwan in Tokio, which speaks of "a number of dried palm leaves, with the Buddhist Scriptures written upon them in Sanscrit or Pali." They will probably be found to contain matter worthy to be subjected to a searching investigation.

MR. H. KATO, President of the departments of law, science and literature in the Tokio Daigaku, has published the calendar of the institution for last year. In the historical summary which serves as preface to the brochure, the course of investigation by Japanese into the lore of the West is traced from the day when Chikugo-no-kami, acting under the instruction of Iyenobu, in the early years of the eighteenth century, began those inquiries into the condition of Rome and Holland which gave rise to the introduction of European learning. It was not till the commencement of the present reign that properly organized effort was made to establish such a university as is now the means of effecting such excellent work in the cause of higher education. At present, instruction is principally imparted through the medium of the English language, though it is intended ultimately to give all lectures and furnish all papers in Japanese. French or German is taught as well; and law students must acquire a knowledge of the former tongue. At the end of the fourth year of study, degrees are conferred upon graduates. On the 10th of July, 1879, the first batch of degrees was granted, fifty-five students being the recipients, on an occasion of great ceremony, at which General Grant, who was then visiting Japan, was present by invitation. In addition to the various examination papers, and the regulations, the work contains lists of officers and students. Of the latter, nine are now pursuing a curriculum in America, ten in England, and four in France.

ON the 3rd of April we wrote concerning the possibilities of cinchona culture in Japan. We have now further information from elsewhere which may be useful, in the event

of attempts being made to introduce and acclimatize this valuable tree. We read that the visit of Dr. King to Java has led to the discovery, among other important facts, that planters have been very careful in the selection of their cinchona seed, and that the superiority of their bark is to a large extent due to the fact that they grow good varieties. This is a point in planting which is frequently lost sight of. People purchase the cheapest seed, forgetting that what is a little more expensive at first may prove most profitable ultimately. The same mistake was made in many of the Indian tea districts. In the North-West, where the Government tried experiments at a very early date, nothing but the very commonest of China plants are found. This was, however, brought about by another cause than a mistaken economy. The Assam variety was practically unknown at the time these properties were opened, and seed being consequently purchased in China, it was natural that the Chinese should not be disposed to give their best varieties. A writer in an Indian paper says that now, however, the case is vastly different; and he gives the valuable advice that, in extending and re-filling, in all gardens, whether tea, coffee, cacao, or cinchona the greatest care should be paid to the seed, and only that quality planted which experience has taught us will give the best results. He adds "In the larger gardens of Dehra Doon where an all-round outturn of 464lb. per acre was obtained in 1878, the price realised was only 9½ annas per pound. Now the advantages which those gardens enjoy in the matter of labour are such, that this tea was produced at a cost of six annas per lb., and had the quality been Assam Hybrid, the average value would have been much higher, with only the initial cost of seed to add to the expenses. Now, that we know the best quality of bark to grow (*Cinchona calisaya*), planters should go largely in for it, and not waste their time in planting land with inferior varieties, whose only qualifications are that the seed costs less, while the produce is immensely inferior as to quality."

IN a former issue we gave the percentages which represent the English, American, and Chinese interests, respectively, in the carrying trade of China. Writing on the same subject to the *Times*, under date of the 12th of January, the Shanghai correspondent of that journal says:

The carrying trade of China tends to pass more and more into English hands, and in the immediate future it is likely that the whole of the river navigation along the Yangtze between Shanghai and the riverine ports will pass under the British flag. The Clyde-built, iron river steamers, which replaced the old American wooden hog-frame boats with towering upper works, have proved during the last few years to be a great success. In economy of working, in duration, and in every way which can test the value of a steamer, they have done the greatest credit to their designers and makers, and there is little doubt that, were it not for the protective laws of the United States, the improved river boats would work a wonderful change in the inland navigation of the great rivers of America. The latest additions to the British fleet on the Yangtze have been made in Shanghai by an enterprising firm of Scotch shipbuilders, who have created here in the course of the past sixteen years a ship-building and ship-repairing industry of the first magnitude, where iron steamers and marine steam engines of the largest size can now be produced. All the 1,100 workmen employed are Chinese; and this is a significant sign of the times which ought to be borne in mind by our shipwrights on the Clyde and the Tyne. From the coasting as well as the river carrying trade of China, the American flag has departed, the only American steamers left being two or three men-of-war that are too unseaworthy to sail home. The German interest both on shore and at sea steadily declines, and we English are left to share the trade—a most profitable one as times ago—with the Chinese. So far as regards China there is no lack of energy or enterprise among our merchants.

OUR present issue brings to a close Captain Brinkley's interesting and romantic historical narrative, founded upon incidents which occurred in one of the most stormy periods recorded in the annals of old Japan. No doubt our readers will experience a feeling of regret when they read the tragic fate of the noble and gallant Yoshitsune and his dauntless and devoted followers. Unfortunately, however, regard for historical truth prevented the talented author of "The Times of the Taira" from leaving his hero in the quiet enjoyment of the prosaic happiness which seems almost inseparable from the modern novel. Yoshitsune, as related by Captain Brinkley, died by his own hand, impelled thereto through the jealous fears of Yoritomo; and his famous sword may yet be seen at Kamakura carefully preserved as one of the most hallowed relics handed down to an admiring posterity from the chivalrous ages. We may mention that, in order to supply the space in our columns so worthily filled by "The Times of the Taira," we expect to receive shortly advance sheets of a serial story by one of the foremost English novelists.

## MUSEUMS AND EXHIBITIONS IN JAPAN.

### II.—THE HAKUBUTSUKUWAN.

THIS was the first permanent exhibition in Japan. In 1878 it was placed in the Confucian temple at Seidō, at present occupied by a large and valuable free library; and although the number of foreign articles which it contained was comparatively small, yet it is recorded that the crowds which, drawn by curiosity, first visited it, were so enormous that several persons were crushed to death. At first this exhibition was intended merely as an experiment, but its success was so great, that it was determined, two years afterwards, to make it permanent, and the collection was removed to its present position, opposite the Tokio Fu office and the Hibiya parade ground, about five minutes walk from Shinbashi railway station. The present exhibition building is an almost dismantled Satsuma *yashiki*, but it may be noticed that the entrance gate is one of the very few perfect specimens remaining in Tokio of an old *yashiki* gate. It was one of the smaller *yashiki* of the Satsuma clan, and is said to have been chiefly used as a place of robing for the prince and his chief retainers, when about to pay a ceremonial visit to the Shogun. The *tai rei fuku*, or dresses for state occasions, of the principal officers of the clan, are also said to have been stored in this building in former times.

By far the most instructive portion of the collection of exhibits is arranged under the general classifications of art, history, education, religion and arms. As would be naturally supposed from such a comprehensive nomenclature, the specimens of this division form a curious medley of objects of many kinds, but are, with few exceptions, entirely Japanese. An exception to their exclusively native character is to be noticed in the presence of some modern English coins, side by side with ancient Japanese mirrors and antique bronzes from old temples. There are also a number of old iron and copper coins of the realm, and a very extensive and interesting collection of paper money, including some issued by the rebels during the revolution. The display of paper currency, although large, is far from being as comprehensive as the collection at the Shihierō or department for the manufacture of paper money, and it is to be noted also that the samples exhibited, though occasionally curious on account of their sizes and shapes, have little further value for the inquirer, as they nearly all date from the eighteenth and nineteenth centuries. Moreover, they are, it is to be regretted, not arranged according to any system, the sizes of the various frames seeming to be the only idea influencing their adjustment. Next to a knowledge of the coinage itself, a study of the paper money of Japan would be most interesting. In no country in the world do paper tokens seem to have been more frequently issued or more unsuspectingly taken in exchange. Indeed this kind of money commends itself to everyone as the most portable and convenient; and to the Japanese of the olden time, ignorant of the laws which govern currency, and having no knowledge of the practical effect of these laws, it may well be believed that paper money was preferable to the coins themselves.

Of considerable archaeological interest is the display of old bronze swords, flint arrow-heads and axes, and other prehistoric weapons. The arrow-heads are well arranged, very numerous, and include a number of remarkably good specimens. There are also a quantity of small bronze bells, such as have been exhumed from various parts of the country, which are supposed to possess considerable antiquity, as can easily be imagined from their appearance. An interesting notice on the subject of these bronzes was contributed a year or two ago by a Japanese gentleman, to the Asiatic Society of Japan, from which it appeared that they had formed the pendants at the eaves of countless ancient pagodas, which had been erected over all parts of the country at the time of the first general adoption of the religion of Buddha, during the enthusiasm and ardour shown on the propagation of the new faith. Among various specimens of the plastic art, such as old temple roofing-tiles of enormous size, and examples of primitive pottery, may be noticed some rare and curious models in clay, of animals and figures taken from old tombs.

The rapid changes which have taken place in the ceremonial of the court and government renders of considerable interest certain objects which, though actually of but recent use, yet from the suddenness and completeness of the changes that have made them obsolete, seem shrouded already in considerable antiquity. As an instance of such articles of use, now superseded by their western equivalents, may be noticed the gorgeous but clumsy palace cars, which, drawn by oxen, were used for conveying the Empress and court ladies to the outdoor pleasures of the seasons. These richly lacquered and gilt conveyances may be seen figuring in many pictures of old court customs and processions. More important still is the state chair of the Emperor, constructed on the two long shafts by means of which it was carried on the shoulders of some thirty attendants. This chair or car, which has a curious carved roof, bears upon its apex a representation in gilt bronze of the mysterious bird closely connected with the sanctity of the Emperor, and to be noticed frequently in the decoration of Imperial buildings. Other paraphernalia, now replaced by the gold lace and cocked hat of European courts, can be seen in the form of a few ceremonial robes such as were worn on high occasions by the *Kuge*. Among these is a curious crown-shaped cup, containing a silk pocket for the cue of the hair, and surrounded on the outside by light, pierced metal-work set with jewels. Such a coronet was worn by princes of the highest ranks upon the accessional ceremony of a new Emperor. We notice also, in this part of the exhibition, various old musical instruments, also some antique masks used in the quasi religious dances, such as the *No* and the ordinary temple *Kangura*. These keep company with certain modern paintings by European artists, of which little need be said but that they present an appearance of no small incongruity, placed as they are amidst the grotesque objects of ancient religious Japanese ceremonies.

The art of war is represented in the museum by various suits of lacquered armour and some primitive cannon and mortars in bronze. The collection of armour is poor, compared with what is to be found in museums in Europe and even in the possession of private persons, and indeed more than once in our rambles through this and similar national collections, we have been compelled to lament the poverty and incompleteness displayed by Japan in objects of that native art whereof such rich specimens may be seen elsewhere.

Amid those articles of exposition which may be considered educational, are some number of dried palm leaves with the Buddhist scriptures written upon them in Sanscrit or Pali. Also, especially interesting are some anatomical figures, which are full of interest, as showing the considerable amount of knowledge possessed as to the human organism in comparatively early days. It is often supposed that until modern times the medical practices of the Japanese were confined to superstitious preparations and ceremonies carried out in all the blindness of ignorance; but this is a great mistake. It has often been remarked that, of all the sciences and arts known to civilized man, the healing art is that which appeals instantaneously to the feelings of partially civilized races. And so it has been in Japan. Foreign physicians were always allowed a degree of personal liberty and privilege such as was unknown to the very ambassadors whom they served. Siebold was permitted to reside in the capital when no other foreigner could approach it without many official difficulties, simply on the condition of teaching foreign

methods of healing to half a dozen Japanese youths. The Chinese medical system was commonly employed until recently, but much information was derived from the Spaniards and Portuguese, but above all from the Dutch; and it would be easy to name more than one high official of the Japanese government who commenced his career by studying medicine in Deshima. No doubt the doctors of the old school have still many narrow prejudices and false ideas which modern science will have to eradicate; but the anatomical models of which we are speaking are sufficient to show that considerable study had been bestowed upon the physical organism of the human body, and external and internal diseases, long before foreign surgeons and physicians were hired as instructors.

The remaining divisions of the exhibition are classified as follows:—Mineralogy, Agriculture, Forestry, Zoology and Industry: but the number of objects in these departments is few and unimportant. Models of mines, specimens of marbles and minerals, a collection of various agricultural implements, seeds and tools, are among the most noticeable exhibits. In the department of Industry are to be seen some foreign objects among which may be mentioned a large metal shield, a copy of the *Milton* shield, executed by Messrs. Elkington of London. This specimen of modern European industrial art is decorated with embossed figures, representing subjects from the chief works of the English poet. Also noticeable is a handsome carved wardrobe, by a London maker.

## The Japan Weekly Mail.

'FAIS CE QUE DOIS; ADVIENNE QUE POURRA.'

### NOTICE TO CORRESPONDENTS.

No notice will be taken of anonymous correspondence. Whatever is intended for insertion in the JAPAN WEEKLY MAIL, must be authenticated by the name and address of the writer, not for publication but as a guarantee of good faith.

It is particularly requested that all letters on business, relating to Advertisements, Job-printing, or Accounts, be addressed to the MANAGER.

And that literary contributions of every description be addressed to the Editor.

YOKOHAMA: SATURDAY, MAY 1st, 1880.

JAPANESE ERA 2540, MEIJI 13TH YEAR, 4TH MONTH, 1ST DAY, DO-RO-RI.

### NOTES OF THE WEEK.

An English mail has been received during the past week. The O. & O. steamer *Belgie* left San Francisco for this port on the 10th ultimo, and may be expected to arrive at any moment. The outward despatches went forward in the M. M. *Volga*, on Wednesday last.

The Ocean Steamship Company's steamer *Achilles* left Singapore for Hongkong on the 16th ultimo.

The *Lord of the Isles* will ship, at Hamburg, a large consignment of machinery for Japan.

The Messageries Maritimes Company's steamer *Tanais* left Hongkong for this port on Monday last at 8 o'clock in the evening. The *Tanais* brings the European mail of the 21st of March.

The boys' holiday is fast approaching; and this bright May-day the space above the roofs of many,—we might almost say most,—of the Japanese houses is gorgeous with mammoth carp, of various shades of colour, proving that the good folks have been "doing their duty by the population," a performance for which Mistress Alice received the commendation of the Merry Monarch. Foreigners whose quivers have been replenished with male arrows almost universally adopt the custom, which is one of the prettiest relics of the old "joyous life." By the way, cannot any of those learned in folk-lore trace the connection, if any, between this local celebration and the fish—the mystic *ichthus*—of the early Christians?

It is so long since the Mayeda Bashu was closed for repairs that we may be forgiven for forgetting the exact day on which traffic was thus obstructed. We are safe, however, in asserting that the inconvenience has been prolonged to an extent which is quite inexcusable. Well, the bridge is open now, and it is only fair to say that a great improvement has been

effected in its form and elevation. Perhaps the municipal authorities will now graciously find money, men, and metal, to repair the road leading from the sea, through Honmura to and beyond Ishikawa. Its present condition is a simple disgrace to them and their contractors. There was once a bridge, too, at the foot of the Ishikawa Hill, much traversed by foreign residents. What used to be the approaches to it are now mere heaps of stone and gravel. We were informed the other day that the viaduct was in course of reconstruction and would be completed some day. We shall see.

Mr. A. Huber, Commissioner of the Imperial Chinese Customs' service at Swatow: mentions a singular article of export. It appears that human hair to the value of *Hk. lbs.* 17,500 was exported in 1878, as against a value of *Hk. lbs.* 7,285 in the previous year. He says that attention to the "staple" was called for the first time by Mr. McKean in his report of trade for 1875. He stated that the hair goes exclusively to Europe to supply material for chignons.

The Yokohama Cricket Club commenced the season on Saturday last, with a scratch match between the old and new members of the club. Play commenced at 2 o'clock, the ground being in splendid condition. The Juniors took the bat first, and with 14 runs to D'Almeida, Sutter, 7; W. O. Thompson, 30; Trevelthick, 28; Thompson, 9, and a few small scores, soon ran the total up to 124. The other side then went in but were rapidly dismissed, one after the other, only Abbott getting a double figure, Dr. Wheeler 9. Total for the side 53. The old members having done so badly, followed their innings by sending in Hamilton and Abbott, who both scored quickly. Abbott being run out for 13, Hamilton was joined by Dodds, who scored 17, before being caught by D'Almeida, and Hamilton was run out for 21. Stumps were drawn at 6.30 p.m. Total 62 for 3 wickets.

The *London and China Express* mentioned the launch of the *Yoritomo Maru*, and we now extract further particulars respecting the vessel from the *Sunderland Echo* of the 1st of March last:—"On Saturday afternoon, there was launched from the shipbuilding yard of Mr. Robert Thompson, Jun., of Southwick, a beautifully modelled iron screw steamer of the following dimensions, viz: length over all, 217 feet; breadth, extreme, 32 ft.; depth of hold, 15 ft. 6 in. The vessel has been built under Lloyd's special survey to class 100 A.1., and is fitted with engines of the inverted, direct-acting, compound, surface condensing principle, by Mr. George Clark, Southwick. Ample accommodation is provided for the officers and engineers in the bridge-house amidships, and the topgallant fore-castle is fitted up for the crew. A roomy chart-house and wheel-house are also fitted. She has a short, raised quarter-deck aft, for the accommodation of the captain, steward, and a good number of passengers, with bath-room, &c., all complete. She is also fitted with Harfield's patent windlass, three steam-winchies and horizontal donkey-boiler, by Messrs. R. Roger & Co., Stockton, and patent 'midships steering apparatus by Messrs. Clarke, Chapman and Gurney; and also a patent screw gear aft. Water ballast is fitted in both holds and both peaks. The vessel has been superintended during her building by Captains Morgan and Cotter. As she glided down the ways she was named the *Yoritomo Maru* by Mrs. Cotter, wife of the Captain." The *Yoritomo Maru* has been built to the order of the Mitsui Bussan Kaisha, by Mr. Thompson, of Sunderland, who is also the builder of the *Sumida Maru* and *Hiogo Maru*, two of the finest steamers running on the coast of Japan, and which have always reflected great credit on Captain A. R. Brown, Superintendent of the Tokio Board of Trade, by whom they were purchased in England for the Imperial Government.

Two Renter's telegrams received during the week announce the constitution of the new Liberal Government. Mr. Gladstone has accepted the Premiership, together with office as Chancellor of the Exchequer, as was indeed inevitable from his previous brilliant successes as a financier. The other leading members of the Ministry are:—Lord Granville, Foreign Affairs; Lord Selbourne, Lord High Chancellor; The Marquis of Hartington, Secretary of State for India; Sir William Harcourt, Secretary of State for the Home Department, and the Marquis of Ripon, Viceroy of India. It is sincerely to be hoped that the gloomy anticipations indulged in as to the result of a Liberal victory,

will not be realized; but it is quite certain that the administration of Lord Beaconsfield raised England from the contemptible situation to which a Liberal Government had reduced the country, to the proudest position any state can occupy—an arbitress among the nations of the world.

All doubt as to the new race club has now been finally set at rest. The days for the spring meeting are fixed, the list of original members announced, and a ballot for the gentlemen who have expressed a wish to join the club took place on Tuesday. The following are the original members, and the list affords ample guarantee of the success of the club, and a prosperous future for racing in Japan.

## PATRONS:

Hon. Sec. and Clerk of the Course—Mr. J. J. Keswick.

Treasurer—Mr. E. Zappe.

Tokio Corresponding Secretary—H. E. Wooyeno Kagenori.

The *Hiogo News* says that the tea merchants of Osaka, according to the *Osaka Shimpō*, gave an order in February last to Messrs. Kirby & Co., Kobe, to construct a steamer to be called the *Miomaru*, and which is to be completed at the end of this month. The vessel is intended to carry tea from Shimidzu, Suruga, to Kobe, and also from Kumamoto, Higo, to Kobe. At the same time as this order was given, other parties gave an order to the Hiogo Kosaku Bunkoku for a steamer of the same size, and which is also intended to be run in the tea trade between the same ports as stated above; there will perhaps be some arrangement between the rival steamers as to their running.

At five minutes after eleven a.m. on Sunday, there was a slight shock of earthquake. There was also a smart shock on Tuesday morning, at eleven minutes to ten o'clock. This makes the third within an alarmingly short period, and it almost seems as if the Japanese prediction of the current year being remarkable for these unwelcome visitants, were about to be abundantly verified. The latter earthquake was felt about the same time in Tokio as in Yokohama.

A notice from the Lord Chamberlain, dated St. James' Palace, the 8th of March, states that Her Majesty's birthday will be kept this year on the 29th of May.

The liberal manner in which the young nations growing up in the South Pacific have come forward to aid their fellow-subjects in Ireland in this period of dire distress, is amply shewn by the following list of subscriptions from Australia and New Zealand to the Dublin Mansion House Fund for the relief of the distressed in Ireland, up to February 29th, 1880:—Adelaide, South Australia, £4,500; Melbourne, Victoria, £19,000; Ballarat, Victoria, £1,000; Sydney, New South Wales, £19,500; Brisbane, Queensland, £7,500; Charter's Towers, Queensland, £600; Launceston, Tasmania, £500; Wellington, New Zealand, £200; Dunedin, New Zealand, £1,200; Invercargill, New Zealand, £300; Christchurch, New Zealand, £600; Oamaru, New Zealand, £200; Hokitika, New Zealand, £470; total, £55,570, or over \$278,000.

The number of visitors to the Bazaar in the Swamp Gardens during the week ending on the 25th ultimo, amounted to 20,789. The sales effected on the 19th and 20th, realized nearly 370 yen. We observe that the mode of sale has been altered, certainly not for the better. At first there was an official check upon the prices of the articles sold; now, a purchaser is as much at the mercy of the seller as in the ordinary shops. In addition, the regulation that the prices of all goods shall be marked in Arabic figures is almost entirely disregarded.

A terrible story comes from Aratoff, near the large town of Kieff, in Russia. It appears that a church organist lately confessed on his death-bed to the murder, twenty years ago, of a farmer. He committed the crime with the priest's pistol, which he stole and then placed in the sacristy, confessed to the priest, so as to preclude the latter from giving evidence against him without infringing the obligation of secrecy, and then went and denounced the priest as the culprit. The priest, who vainly protested his innocence, was sentenced to hard labour for life, and, on his liberation being applied for on the strength of the organist's death-bed confession, the reply was that he also had died a few months ago.

Many people are convinced that the custom of eating a heavy meal in the middle of the day is pernicious, and therefore ought to be avoided. This is more particularly the case in hot weather, and as we are now on the threshold of summer the following remarks on the subject, taken from *Vanity Fair*, will not perhaps be inopportune:—

"In his 'Food of Health' restaurant at Farringdon-road, Dr. Nichols supplies his *clientèle* with everything but meat and intoxicants, and his *carte du jour* looks so inviting that I mean to try it if I am ever near Farringdon-road station. There is no doubt that we all eat too much meat. The average Briton, no matter of what class, goes through the world under the delusion that he requires a mutton-chop, a steak, a cutlet, or fish, about one o'clock every day, with wine or beer as well. He takes this heavy meal 'to keep himself up,' though the result too often is to ruin himself for the remainder of the day, so far as work is concerned. I know scores of men at the Bar who lunch on coffee, or tea, and bread and butter, or perhaps a couple of eggs; and one of the hardest-working surgeons in London (I mean Mr. Nunn) told me only yesterday that his lunch invariably consists of coffee and toast—a glass of wine or beer would send him to sleep. But, as I have said, the difficulty is to get good tea, coffee, and bread and butter. What many a poor student, many an impecunious, aye, and many a wealthy barrister, would have done without Groom's I dread to contemplate; the little coffee house has been their salvation. And now that the admirable Nichols has launched forth with his 'Food of Health' restaurants I trust he will be adequately supported, for he is meeting a real want."

From the *Shanghai Courier* of the 14th ultimo we learn that "the *Glencoe*, Captain Gulland, came up from Woosung on last night's tide. So soon as discharged, probably on Friday, she will leave for Nagasaki, and be back here again as early as possible. She will then proceed up the river to load tea at Hankow. She will thus be the first tea steamer up this year. It will be remembered that the *Glencoe* made the crack passage home last year. The *Glenartney* is the next boat belonging to the same company, and is due here in about a fortnight's time. She was the second boat home last year. The "Glen" line have now two new steamers building. One is to be commanded by Captain Hogg, of the *Glenorchy*, and the other by Captain Taylor, of the *Glenfalloch*. Both vessels are expected to be ready in September."

The *Shanghai Mercury* says:—"We hear the Empresses are determined to have the sentence upon Chung-How carried out, if he does not commit suicide by swallowing gold leaf. The interference of the foreign Ministers on his behalf was not a point in his favour."

Honours continue to be heaped upon Professor Nordenfjöld and his gallant companions in the successful solution of the north-east passage. We notice in a home journal, that King Oscar of Sweden has ordered four gold and forty-six silver medals to be struck for the officers and crew of the expedition. These memorials of the greatest feat of modern discovery, bear on one side the image of the King, and on the obverse the insignia of the Order of the North Star.

Some two years since a good deal of attention was directed to a magnificent gift from the then Khedive of Egypt to the Prince of Wales. The Paris correspondent of the *Times*, writing under date of the 29th of February, gives a subsequent phase in the history of this Khedival present:—"The Marquis Ginori, proprietor of the Florence Porcelain Works, has gained judgment in the Naples Court against the ex-Khedive for the sum due for the dinner service ordered by the latter, and presented by him to the Prince of Wales."

At the Sand-lot gathering in San Francisco on the 18th of March last, Steinman, one of the orators on the occasion remarked that, "if he met General McComb coming down Kearny street, and asked for ten cents to buy bread and was refused, he would snatch the watch from the General's breast. He would say with Shakespeare." "He who takes my bread and butter takes my life, and he who takes my life I will take his."

The *Pall Mall Gazette* says that "the instructions lately issued by the German Admiralty, directing that the words "port" and "starboard" used as orders to the helmsmen on board German men-of-war shall in future be employed in a sense exactly the reverse of that which they have hitherto borne, are very far from being unanimously approved by nautical men in Germany. At a general meeting of the Nautical Society in Kiel the new orders were discussed, when eleven members expressed their approval and eleven their strong disapproval of them. When the orders were first published we pointed out that they would be likely to prove a fruitful source of confusion and disaster; and this opinion is, it is now evident, shared by men well qualified to speak with authority on the subject. The same orders, in fact, now mean one thing on board ships belonging to the German navy and exactly the reverse on board vessels of the German mercantile marine; and as men pass in large numbers from one service to the other, confusion, which at critical moments may entail serious disaster, is almost certain to arise."

The Mitsui Bishi Company's steamer due in Yokohama from Shanghai according to schedule on the 6th of May, will not arrive here until Monday the 10th. This departure from the usual running, is made in order to connect with the *City of Tokio*, sailing for San Francisco on the 11th of May.

We have been informed that the sentence pronounced upon the second mate of the American ship *Centennial*, who was lately tried in Kobe for the murder of the first mate of that vessel, has been forwarded to the United States Minister in Tokio for confirmation. It is deduced from this circumstance that the man has been sentenced to be hanged.

Ill-judged economy is stated to have been the cause of the recently casualty to the Princess Louise. A contemporary, likely to be well-informed on the subject says that, "the accident to the Princess Louise was more dangerous than has been represented. The very ugly twist which H.R.H.'s neck received is an unpleasant thing to think of. The English coachman, till recently in the employ of Lord Lorne, had left on a question of wages, and a cheap substitute, who had little pretensions to the art of the ribbons, was picked up in Ottawa. Added to this, one of the horses in the Viceregal sleigh was hired from a veterinary surgeon of the town, and had never before been driven with the Governor-General's horse. The conclusion to be drawn from the narrative is that no wild extravagance characterises the establishment at Rideau Hall."

The exposures in a recent lawsuit in England, have again directed attention to the enormous profits of those fashionable tailors, whose business connection is principally among the aristocracy. Referring to the subject, a writer in *Vanity Fair* mentions an incident in the life of the late Mr. Poole, the celebrated tailor of Savile Row:—"Over thirty years ago—before the Emperor Napoleon had made his *coup d'état*, and had ordered all his liveries of Mr. Poole in recognition of the eminent tailor's assistance—my friend asked the latter what he was making Mr. Poole replied, 'I have seven hundred names on my books and, with bad debts, I make about £7,000 a-year.' Twenty years later my friend again found himself in Savile Row, and said, 'Well, Mr. Poole, you are a great man now. Do you

remember what you once told me, that you had seven hundred names on your books and made £7,000 a-year?' 'Yes, I do,' replied the amiable tailor. 'Well, how many have you now?' 'I have now seven thousand on the books.' 'Then, at the same rate, you must be making £70,000 a-year.' This struck Mr. Poole, who turned away saying quietly, 'Well—yes. I suppose so.' My friend has ever since regretted that he was not in Savile Row instead of being in the Grenadiers."

The memorial to the late Prince Imperial, the erection of which in Westminster Abbey has provoked such strong opposition, is thus described. The prince is represented in a recumbent position, his head supported by two pillows powdered with Imperial bees, and a military cloak under him. He wears the English Royal Artillery uniform; the hands, folded across the breast, rest on the hilt of his naked sabre. At his feet, the pith helmet and puggaree; a pair of spurs to the right, a sword-scarbald opposite, and on each side of this a glove. The statue is universally admitted to be of beautiful workmanship and a great credit to the celebrated artist its author.

On the subject of the new class of vessels building for the British Navy, the *Pall Mall Gazette* remarks:—"The *Doterel*, just launched at Chatham, is one of an important class of unarmoured sloops which have for the past four years been under construction. With a hull of steel, a light draught, and a speed of about fifteen knots, she forms one of a serviceable fleet of vessels belonging at the present time to the British navy. The principal drawback to these vessels lies, however, in their armament. The great difficulty of arming sloops and corvettes with heavy ordnance has not been overcome, and it seems doubtful if we are any nearer a solution of the difficulty than we were ten years ago. To some extent an improvement has been made in the arming of gun-vessels and gunboats. Vessels of this kind, of the *Sabrina* class, which carry one 38-ton gun each, and of the *Tickler* class, which carry an 18-ton gun, represent a considerable advance in the arming of unarmoured vessels. But, independently of the armament of such a vessel as the *Doterel*, the vessel herself represents a considerable advance on the sloops which were built only a few years ago. With a steel hull far more powerful machinery can now be used than was formerly possible; and more powerful machinery means increased speed. Yet, in spite of improvements in construction and of steady perseverance in constructing such vessels as this, it is doubtful if a sufficient advance has been made either in numbers or power or speed. Undoubtedly there has been a difficulty in riveting home the assurance that unarmoured construction was never more necessary than now; that armoured ships, so far from having superseded unarmoured, have rendered them all the more indispensable; and that, so far from our being able to pause in the task of providing the navy with unarmoured vessels it is now more than ever imperative. Sir Spencer Robinson, of all men, ought to know what are the real needs of the navy as a late Controller of the Royal Dockyards; and he should, of all men, be indisposed to exaggerate them in any direction leading to useless expense, as late member of a Liberal Board of Admiralty. His description of our unarmoured fleet at the present time is that, "supposing that no war should break out until we have completed the repairs of and put new boilers into the ships in hand, we should have three first-class iron frigates whose speed exceeds fifteen and a half knots, two slow wooden frigates, four first-class corvettes with a speed of about fifteen knots, two with a speed exceeding fourteen knots, eleven others none of which exceeds thirteen knots, as the unarmoured force on which we must depend for the protection of our commerce and for defending us from starvation—so far, at least, as that could be done by keeping the high seas through which the food-bringing ships must pass open and free from molestation." This is no doubt a gloomy view of our present position in regard to our unarmoured fleet. Still, a good deal of work would seem to have been done in this direction, for on the 1st of January, 1879, there were no fewer than 307 vessels of this description in various stages of efficiency, of which twenty-eight were, like the *Doterel*, in course of construction or completion."

## REUTERS'S TELEGRAMS.

LONDON, 26th April, 1880.

Mr. Gladstone has undertaken the task of forming a new ministry and has accepted the premiership. Mr. Gladstone has been appointed Chancellor of the Exchequer, and Lord Granville Secretary of State for Foreign Affairs.

LONDON, 30th April, 1880.

The Marquis of Ripon has been appointed Viceroy of India; Lord Selbourne, Lord High Chancellor; the Marquis of Hartington, Secretary of State for India; and Sir Wm. Harcourt, Secretary of State for the Home Department.

(From the *Hongkong Daily Press*.)

LONDON, 14th April.

The *Atalanta*, 4 guns, training-ship, is missing, and the Channel Squadron has been ordered to sea to search for her. She left Bermuda on the 31st January.

The *Standard* states that the Cabinet will resign after the Queen returns to Windsor.

LONDON, 15th April.

The elections are concluded and have resulted in the return of 349 Liberals, 235 Conservatives, and 63 Home Rulers.

Admiral Bontakoff has been appointed to the command of the Russian Squadron in the China seas.

[The number of seats, exclusive of the four boroughs disfranchised for corrupt practices, is 652, while the number of members mentioned by Reuter is only 647. There must, therefore, either be some mistake in the telegram or else the elections are not quite concluded. From the above return it will be seen the Liberals have a clear majority of 114. There must be a large infusion of fresh blood in the new Parliament, and possibly material for a new Cave of Adulam, if the Liberal Government-elect should attempt to reverse the foreign policy of the Beaconsfield Administration. It will be interesting to learn the composition of the new Parliament. The Home Rule party have gained 5 seats, which were probably won at the expense of the Conservatives.—Ed. D. P.]

## PARIS LETTER.

(On Scientific subjects.)

PARIS, March 13th, 1880.

The Scientific Association of France has resumed its instructive Saturday Evening Conferences at the Sorbonne, our Royal Institution, under the presidency of the celebrated and indefatigable M. Milne Edwards. The subjects selected are of every day-living interest, are the speciality of each lecturer, and are handled in a popular manner and illustrated with suitable apparatus. M. Jamin has expounded the latest discoveries in telephones and phonographs; M. Egger has deciphered the recent papyrus finds in Memphis; M. Bouley has examined the question of *rabies*, and M. Gaston Tissandier, of elevated ballooning notoriety, has revealed many interesting facts on atmospheric dust, its connection with cosmical matter, and the important rôle it plays in fermentation and decomposition. As the air is purer after being washed by rain, so in dry weather, and especially in cities, the atmosphere is a veritable dust-bin. We are sensible of the existence of these particles of attenuated matter; in breathing them, they disgust us, and in falling and remaining on cloth and furniture they demonstrate not only their presence but their plentitude. Admit a sun-beam into a darkened room and the molecules will be revealed like nebulae; yet the numbers we perceive are perhaps but the minimum of what exists; for after the naked eye and the microscopes have done their utmost there are minutiae which dance still unseen. Much of this atomic *debris* is of inorganic origin, and a great deal is derived from animal and vegetable sources. The renowned experiments of M. Pasteur have demonstrated that, among these atomies which live, move, and have their being in the air, are germs or spores of fermentation and decomposition, that is to say, the seeds of disease and death. Showers of dust, impalpable as flour, and sometimes red as blood, have fallen in several parts of the world, astonishing or frightening, as the populations are superstitious or cultivated. These

showers are simply silicious particles whipped up to the superior regions of the atmosphere, and driven along by aerial currents. Such particles have been lifted in Guiana, and showered on New York, the Azores and France, and Erbenberg detected in them animal culæ and shells peculiar to South America. Over the summits of the high mountains of the latter country, the atmospheric currents are ever charged with silicious powder, and in parts of Mexico, the crests of mountains act as veritable bars, and compel the deposition, from these air-streams, of the dust, which accumulates in the valleys to the depth of ninety yards. Geology recognises these atmospheric deltas. The foam of waves as they dash against the coast, is pulverised into feathery pellicles, which float skywards with a trace of saline matter, and a sea breeze carries them far inland. Space contributes, as well as earth and ocean, to the production of aerial dust. When meteorites and falling stars are rendered luminous and incandescent by their rubbing against strata of air in their vertiginous flight, they part with quantities of their metallic elements in the form of powder—iron, nickel, and cobalt, substances that Nordenakjöld has gathered on the virgin snow of the Polar regions. When atmospheric dust, whether collected directly on a sheet of paper, or from the sediment of snow and rain, is probed by a magnet, the tiny particles of iron attracted, have all a spheroid family likeness, resembling furthermore iron filings if melted in a flame of hydrogen, or the extinguished sparks that fall on striking an ordinary flint and steel. Nay more, similar atoms of meteoric iron have been traced in the lower lias formation, geology thus affording evidence that, as now, so before the appearance of man on earth, atmospheric dust existed. The air is a vast storehouse of animalcules. Expose a solution of some organic substance to the atmosphere for twenty-four hours, it will be speedily inhabited by myriads of infusoria, rolling and tumbling, yet so small, that hundreds of them if placed in a row would not form a line in length. These worms resemble little eels. Analogous animalcules induce decomposition and fermentation, for the latter cannot take place unless the organic matters be in contact with the air to receive the seed of the leaven, which by cellular propagation leavens the whole mass. It has lately been shown that the process of nitrification in certain soils is due to a peculiar ferment, that is to say, to a spore floating in the atmosphere. Finding its conditions for action, it stops and operates. Marsh fever is due to cellulæ or spores existing in a bog neighbourhood: the same spores have been detected by the microscope in the expectorations of the patient, in the dew, and on the surface of the peaty soil where they were generated. This is simply poisoning; to a like cause is due the fell disease known as hospital gangrene; the germs in the polluted ward-atmospheres enter the wounds, inducing putrefaction and death. Hence the importance of washing the affected part with carbolic acid or other antiseptic, then dressing it with a wadding that will intercept, by acting as a filter, the germs to be deposited from being sown. In many factories workmen become victims to the dust, generated by their special industry, entering and saturating the lungs. On dissecting old colliers, their lungs after forty years respiration of dust, instead of being rose-colored as in health, are as black as the coal itself. Dust in this impalpable form is often the cause of accidents; it can take fire and blaze like alcohol. Witness the catastrophe at the Minneapolis flour mills; the confined air, highly charged with fine flour, became on a par with ether or alcohol, awaiting only ignition from the heated millstone to burst into flame and explode.

The Society of Legal Medicine has discussed the question of shop-lifting, but no very clear results have been arrived at. It was maintained that in the case where the accused female's family was liable to hereditary cerebral irregularities, the court ought to accept such as an extenuating circumstance. It seemed to be the opinion that too much importance was attached to the abnormal inclinations and fancies of women *enceinte*, and, also, that the interests of justice were not served by the numerous classifications that alienists indulge in. Dr. Lassègue repudiates all the doctrines about monomanias. A woman "shop-lifts" because she has not the strength to resist, and if any obstacle rises up to baulk her thieving, that chance will save her, as reason does in the case of others. He disbelieves

in the theory of excitement. The seduction is not greater than that which other females experience at the view of articles of toilette: it is transitory, and the thief speedily forgets, not only the pleasure she anticipated from possessing an object easily obtained, but the fault itself. He concludes, "the less the impulsion of the weak-minded will be imperious, the more she will be encouraged by every attraction—that of impunity included."

M. Hirn has devoted a good deal of attention to the subject of human heat, and in his experiments has been assisted by professor Herzen, of Florence. Heat, or caloric, is synonymous with force, and there ought to be a gain or loss of heat, according to the nature of the work. For example; the exertion to raise our own weight in ascending a staircase, or a mountain, must represent a loss as compared with descending either. Now M. Herzen affirms in both cases the contraction of the muscle is almost the same; there is only a slight difference in the intensity of the contraction executed, but none in a physiological point of view. From the moment when there is no external work there is no consumption of heat; when a muscle contracts, there is a diminution of temperature, and deoxidation. Following the contraction or expansion of the muscles, the physiological actions will vary: a Swiss guide will ascend a mountain carrying a burden, without manifesting fatigue; but perspiration will be more or less intense; the pulse and respiration will be accelerated; the panting will be more or less sensible, according to the robustness of the individual. These phenomena will be less during the descent. Does intellectual work consume or produce heat? No, according to M. Hirn, the course of our thoughts modifies at each moment the march of the organic functions; each feeling of joy, of sadness, of pain, of fear, or of agony, determines special modifications in the rhythm of the pulse, of respiration, &c. Nervous persons know how each emotion may create muscular tremblings and active heart-beatings. Intense and sustained intellectual work often produces cutaneous transpiration amounting to positive perspiration. Is there no loss of heat in this case? None, because the labor is internal, and has nothing in common with external manual work; but the intellectual exertion can influence the nature of the materials that oxygen burns, during the process of respiration; it can modify the employment of oxygen, and thus change the conditions of combustion.

M. de Bellesme has been studying the phosphorescence of the glow-worm, from the physiological side. He substituted for the will of the insect, an electric current and thus was enabled to produce the luminousness desired. He ascertained, and so corroborates Mattenci, that the presence of oxygen is indispensable to the production of phosphorescence. Hence, there is in the luminous organ the production of a matter which, in combination with the oxygen of the air, produces light; the structure of that organ excludes the possibility of all secretion, liquid or solid, for the matter is gaseous, and only phosphuretted hydrogen is glowing under ordinary conditions. Not only is there no phosphorus accumulated in the organ, but there is no provision of matter at all. M. de Bellesme has demonstrated, conclusively, that the luminous substance is produced in proportion as it is required—never accumulated; that phosphorescence is a general property of the protoplasm, the result of phosphuretted hydrogen produced therein by chemical decompositions in connection with the cellules of the organ; the decomposition in the case of the glow-worm, being under the nervous influence of the insect, which is essential for setting free the phosphorescence.

The estimate of the quantity of cream contained in milk can now be made, very accurately and rapidly, by means of centrifugal force. Attach the handle of a can filled with milk to a cord; hold the other extremity of the latter in the hand, and twirl as if for a sling. The cream, lighter than the rest of the milk, will accumulate on the surface free from all liquid, and more quickly than if in a state of repose; the time will even be lessened in proportion as the revolutions are rapid. When the milk has a temperature of 59 to 68 degrees F., the separation of the cream takes place in fifteen minutes, at the rate of 600 revolutions per minute. At the same time the quantity of water added to the milk for adulterating purposes can be ascertained. M. Gembloux, having tested that pure milk contains ten per cent of cream, added one, then a second tenth,

of water; and, when whisked, the cream represented but nine and eight per cent of the volume of the milk. Further, when whirled in the cylindrical churn, the contents formed three distinct layers—cream, water, and skim-milk. The same centrifugal test was applied to butter, maintained in the liquid state by means of hot-water; the butter separated into three states towards the circumference of the churn, fatty matter, caseine, and salt water; it was in the latter that all the mineral adulterations lodged. It was at the Exhibition of Vienna that an apparatus for separating cream from milk by centrifugal action, was first made known: it is to M. Lefeldt that the honor reverts for applying the system on a vast scale by means of a turbine cylinder making 800 rotations per minute, when the cream is formed round the axle of the machine, after which comes the skim-milk and then the impurities, forming, as it were, three rings or zones. Other skim-milk is introduced, which forces the cream to run over, and thus out of the cylinder. M. Lawal's Swedish skimmer is so constructed that, in proportion as the cream and skim-milk are separated, they pass off, by the entrance of fresh milk. In the co-operative dairy at Kiel, 4,000 quarts of milk, the produce of 550 cows, are centrifugally skimmed per day.

M. Forel's experiments on Swiss lakes prove that cold can penetrate therein to the depth of 120 yards.

Professor Nordenskjöld has stated in a letter to M. Daubrée that, judging from his dredgings in the Siberian sea, the fauna most rich in individuals, at a depth of from 33 to 110 yards, do not exist between the tropics, but in the Glacial ocean and Behring sea, where the temperature too remains, at the bottom, from 30 to 28 degrees F. The municipality of Paris, intends receiving and honoring M. Nordenskjöld, in the name of French science.

#### THE REPORT OF THE SANITARY BOARD OF YOKOHAMA FOR 1879.

HOUSE TO HOUSE VISITATION FOR THAT PART OF YOKOHAMA, SITUATED NORTH OF THE OKAGAWA  
AND SAKURAGAWA.

##### TOPOGRAPHY.

This part of the town embraces the foreign settlement (the Bluff excepted) and the following twenty-two streets of the native town:—Hon-cho, Kitanaka-dōri, Motohama-cho, Kaigan-dōri, Minami-naka-dōri, Benten-dōri, Sakai-cho, Otamachi, Aiwoi-cho, Sumiyoshi-cho, Tokiwa-cho, Onoyō-cho, Masago-cho, Minato-cho, Sakuragi-cho, Uchida-cho, Fukunaga-cho, Nagadzumi-cho, Midori-cho, Tachibana-cho, Takashima-cho, Ura-Takashima-cho.

These twenty-two streets have 4,860 houses with 18,016 inhabitants. In the foreign settlement there have been visited 292 houses with an uncertain (not registered) number of persons. The repeated opposition of the Chinese Consul has prevented the Committee from visiting the houses in the settlement, occupied by Chinese. This is the more to be regretted as it seems that those houses and compounds, which are now excluded from the visitation, were justly most in want of a better sanitary arrangement. A glance at the map shows that the inspected district follows the sea-shore, from Yato-bashi to Kanagawa; that it has in the south-eastern direction the Bluff, in the south-western the Okagawa or Swamp Creek, in the eastern the hills at Nogé and Ota, and in the northern direction the sea, as its boundaries. Although the greater part of this district has been a swamp in former years, the ground has been raised sufficiently, and is now at least three feet or more above ordinary high-water mark. It forms the most important part of the town, where commercial business is transacted, and it is populated by the relatively most wealthy people. The streets Uchida-cho, Fukunaga-cho, Nagadzumi-cho, Midori-cho, Tachibana-cho and Takashima-cho make an exception, as they are chiefly inhabited by public women. Sakuragi-cho is for the greater part inhabited by coolies, working-men, and artisans.

The soft clayish rock of the neighbouring hills at Ishikawa, Nogé and Ota, has served to fill up the former swampy parts of this district. The ground is now solid, not marshy or damp, although the surface wells naturally give either a brackish or a very hard water. Along the footways there are in some streets stone surface-gutters, which communicate by gully-holes with underground drains of pottery, for the purpose of carrying off storm water.

Drains and sewers for the removal of sewage or slop-water are still wanting, inasmuch as the wooden surface gutters can scarcely bear that name. As to the character of the soil we cannot pronounce this district an unhealthy one, provided that the houses are built with proper foundations and basement-floors, and that the water-supply, scavenging, drainage and manner of constructing closets, receive the required attention.

##### GENERAL CONDITION OF THE HABITATIONS.

IN THE SETTLEMENT the houses are as a rule not unhealthy. Overcrowding does not exist. There is space, air and light in

sufficient quantity; the soil is dry: the foundations and basement-floors are not too low, and do not show any signs of dampness, when the rain-water from the roofs is properly carried off by drains. The houses in the quarter occupied by Chinese would certainly provoke many remarks as to their insanitary condition, if the Committee had not been obliged to exclude these habitations from the visitation.

As to the tea-firing places in the settlement some ameliorations seem very desirable from a sanitary point of view, especially in regard to ventilation, drainage, water-supply and construction of closets. The habitations 81 A., 81 B., 126, 186 A., 188 B., 191 A. and 192, especially require better sanitary arrangement as to cleanliness, closet accommodation and order. The out-houses of the foreign dwellings in the settlement are, as a rule, not kept in a sufficiently solid and hygienic condition, most proprietors or occupants evidently taking very little or no care about the condition of the dwellings of their servants, which are often in a very bad and dirty state. Not only does this defective estate of the servants' dwellings form a real danger for the health of the servants themselves; but such a state is also dangerous for their foreign masters and families. Moreover, it promotes the good order, clean habits, and moral character of the servants, if the masters provide a good, clean and neat habitation for the servants. This neglect, or want of care, for the habitations of the Japanese servants, is in fact a general fault of the foreigners of this settlement, and it is of the utmost importance that a change be effected in their deplorable carelessness.

**NATIVE TOWN.**—In this part of the Japanese town there is no overcrowding, the 4,864 houses being inhabited by 18,016 persons, which gives an average occupancy of 3.7 persons for each dwelling. The houses in the better streets, occupied by the wealthier merchants, such as Hon-cho, Motohama-cho, Kaigan-dōri, Bente-dōri, Sakai-cho, Otamachi and Aioi-cho are tolerably good, although the foundation and basement-floors are as a rule too low. Sakuragi-cho, which is mostly inhabited by coolies and workmen, has many houses and *Nagaya's* of bad construction and in a dilapidated condition. The remarks made by the committee for another part of the town, as to the desirability of starting a company or society for the improvement of working-men's dwellings, we also endorse, because it is clear that the owners of the *Nagayas*, who rent the numerous compartments of these fragile structures under one roof to the workmen and coolies, do not keep the houses in sufficient repair. The streets, Uchida-cho, Fukunaga-cho Nagazumi-cho Midori-cho, Tachibana-cho and Takashima-cho, all along the beach, north of the railway station, are inhabited by keepers of public houses, and require more rigorous sanitary supervision, especially in regard to cleanliness, order, privy accommodation and removal of slop-water.

#### CONDITION OF PREMISES, PUBLIC CLEANLINESS.

**SETTLEMENT.**—In the settlement the removal of house refuse from the premises is, as a rule, done in a tolerably efficient manner. In all, the committee has inspected 275 compounds within the settlement, twelve of which were in a decidedly filthy condition, 200 tolerably clean, and 63 very good. Still the scavenging, especially the closet scavenging, would be better and more regular, if every occupant of a house could be forced to pay the scavenging rate, and if a special refuse-box or brick ash-pit, for temporarily storing the kitchen refuse until the scavengers came, were constructed in every compound. Those who pay the scavenging rate, might complain by letter, to the Sanitary Bureau of the Kencho, if the scavengers did not regularly remove the house refuse; and the health officer could finally compel the contractor to have regularity observed by the scavengers. On the other hand, the foreign residents ought to instruct their servants to give every facility to the scavengers, and not to let them wait a long time before opening the gate.

**NATIVE TOWN.**—In the Japanese town the removal of house-refuse is, as a rule, defective, the back-yards of many houses being filled with all kinds of kitchen debris. In some streets there are boxes for temporarily storing the refuse, in others there are none. The erection of more ash-pits, and the appointment of more scavengers to remove all sorts of filth and garbage, seem therefore necessary in the native town.

Of the 4,860 compounds inspected, there were 183 in a clean state, and 4,677 in a more or less filthy condition. The streets which had the most filthy compounds were Uchida-cho, Fukunaga-cho, Nagazumi-cho, Midori-cho, Tachibana-cho and Sakuragi-cho.

#### CONDITION OF CLOSETS; REMOVAL OF EXCRETA.

**SETTLEMENT.**—In the 292 houses of the settlement, we have inspected 711 closets, most of them badly constructed and many moreover in an unclean state. Especially the closets for the Japanese servants, which were as a rule bad, and made with wooden oil tubs or saké-tubs as reservoirs.

Of well constructed closets, with a pot set in cement, or with cemented brick wells, there were found 50 only; of those with metallic iron or zinc pails or buckets, and earth-closets with metallic reservoirs there were 14; further, 216 closets with movable stone pots (Japanese, Chinese or foreign jars) without surrounding by cement; 361 closets with Japanese, Chinese or European wooden tubs, mostly bad, dirty or in a rotten condition, and 70 closets with square wooden boxes.

The total number of tolerably clean closets was 280, whilst 431 were in an unclean state. The inspection has thus fully proved, 1st, the necessity of building better impermeable closets in the settlement, especially those intended for the servants; and 2nd, a better control over the scavenging of the closets. In the visitation-reports, which the Committee has sent to each occupant of a house, the building of metallic buckets, according to the pail-system, or the construction of closets according to the pot system, with cemented slope, has been recommended to the inhabitants. The

higher and middle classes of the foreign population will no doubt take the necessary care for rebuilding the defective closets, but the lower class will, as we fear, leave the advice disregarded, unless there should be found some means of forcing them to construct proper closets. As the cost of a good closet, according to the pot-system, is by no means heavy, it seems to us very desirable that the Consuls empower the sanitary office of the Kencho to enforce the construction of proper closets in all parts of the foreign settlement, the unwilling being fined in a certain sum, and the closet built at their cost by the authorities. In all civilized countries there exist local police regulations upon this matter, and there is no reason why they should not be adopted in a town like Yokohama.

**THE JAPANESE TOWN.**—In the 4,860 houses were found 4,612 closets, mostly very badly constructed and in an unclean state. Old wooden tubs were the reservoirs mostly used to receive the excreta. Only 425 closets were properly constructed and in a clean state, whilst 4,187 closets were dirty or of defective construction. The closets and urinals in the public houses between Kanagawa and the Railway Station especially require better construction and more sanitary supervision as to their cleanliness. It is to be hoped that the visitations, and the steps which afterwards have been taken by the local Government, will lead to a better understanding of the great importance of clean, watertight closets, because unclean, wooden closets are in fact dangerous to health, and especially liable to cause a rapid spread of zymotic diseases amidst the population.

#### CONDITION OF THE WATER SUPPLY.

**SETTLEMENT.**—The wells of the foreign settlement contain, as a rule, very hard water, ranging between 14 and 22 degrees of hardness. As a good, healthy drinking-water should not have more than 12 degrees of hardness, that is to say 12 parts of calciumoxide in 100,000 parts of water, it follows that the water of the wells in the settlement is not of fine quality, because it is too hard.

In all, we inspected 251 wells in the settlement, the water being analyzed at the Government laboratory at Bente. The results of analysis were that 91 wells had water of medium quality, that is to say, hard water, but not polluted; 71 wells proved to be polluted and were declared bad; 84 wells were only used by the occupants of the houses for washing purposes, and 5 wells were either dry or in decayed condition, so as not to be used at all. There were, in the settlement, 192 houses which had no well with water fit for drinking purposes, and 56 houses which had no well at all, either for washing or drinking purposes.

From these figures we see that the water-supply in the foreign Settlement requires amelioration, because it is clear that the 292 foreign houses (the Chinese quarter excepted) cannot be provided in a sufficient manner with drinking water by the 91 wells of medium quality, which are found in the Settlement. The water of the neighbouring Bluff, or that of the aqueduct, can only provide a better water-supply in the Settlement, because the boring of new ordinary wells will only give other wells of hard water, not polluted it is true, but too hard to be healthy. Those houses in the Settlement which are situated near the Bluff can, without much difficulty, obtain their drinking water from the wells on the hills or from the Ishikawa water-works: consequently we advised them to take their drinking water from there; but for the houses in the more western parts of the Settlement, and also for the Swamp lots, it would be very desirable to have the aqueduct extended to these streets. By levying a moderate water rate for each house it would not be difficult to find the necessary funds for extending the present aqueduct which goes as far as Minato-cho, into the settlement by means of the American Wyckoff pipes or by iron tubes. The necessity of providing the old and new Swamp (if houses are going to be built there) with drinking water is absolute, as in these parts of the Settlement not one well fit for drinking purposes can be found. Very little care is taken as a rule to remove closets, drains, sinks or stables from the immediate vicinity of the wells, and in many instances the pollution was caused either by a neighbouring dirty drain or sink, by a Japanese wooden-tub closet, or by a stable. Owners of houses ought also to instruct their servants not to wash their rice, vegetables, linen, dresses, etc., at the wooden or stone-floor, close to the well, because the slop-water enters in many cases into the well by infiltration, and pollutes the water.

**NATIVE TOWN.**—In the part of the town, inspected by us, only seven streets Sakuragi-cho, Sakai-cho, Motohama-cho, Kitanaka-dōri, Hon-cho, Minami-naka-dōri, and Bente-dōri possess wells, the water of which is used for drinking purposes. The other fifteen streets Kaigan-dōri, Ota-machi, Aioi-cho, Sumiyoshi-cho, Tokiwa-cho, Onoyé-cho, Masago-cho, Minato-cho, Uchida-cho, Fukunaga-cho, Nagazumi-cho, Midori-cho, Tachibana-cho, Takashima-cho, and Ura-Takashima-cho have either no wells or only wells with brackish water, used for cleansing purposes. All the above-mentioned streets have now, however, the aqueduct as a means of drinking-water supply, and those who are willing to pay the rate for the use of the aqueduct, can obtain very good water. People living in the first-named seven streets, which have some wells, use their wells, because it is cheaper and because it spares them the outlay for the use of the aqueduct. In all, 655 wells (besides the aqueduct wells) are found in this part of the town. Of these 153 are used for drinking purposes, whilst 502 with brackish water only serve for cleansing purposes. Of the 153 wells of drinking water, only 53 possess water of medium quality, that is to say hard water, but not polluted; 100 wells showed indications of pollution and were therefore considered bad. We should re-

2 We observe that some inhabitants of the lower class in the settlement refused even to receive the visitation-reports, which was gratuitously sent to each occupant of a house.

3 Pollution is indicated, 1° when the water smells disagreeably, 2° when it contains more than 5 parts of chlorine in 100,000 parts of water; 3° when it shows more than 0.2 parts of nitrous acid in 100,000 parts of water; 4° if it contains more than 1 part of iron in 100,000 parts of water; 5° when it contains more than 0.05 parts of ammonia in 100,000 parts of water; 6° when it discovers more than 0.3 parts of mineral chameleon in 100,000 parts of water.

1 Some compounds in the settlement are damp, because the rainwater from the roofs of the houses and pavilions is not carried off in a proper manner by drains, but penetrates into the ground round the houses. The soil is in itself not damp or marshy and is sufficiently raised.

commend the people to make use of the aqueduct alone for drinking-water, as it is, after filtration or subsiding, very pure and wholesome. The fifty-three wells with water of medium quality possess, as do the wells in the foreign settlement, a very hard water, ranging between 15 and 23 degrees of hardness, with a very large amount of chlorine. The superfluous water of the present aqueduct runs simply away into the canal at Minato-cho, and would be amply sufficient to provide also the Swamp, the foreign Settlement and the district between the Nakamura-gawa and Oka-gawa, with good drinking water, if a company were started to combine with the present aqueduct company for the extension of the same into those parts of Yokohama where at present no aqueduct exists. This would not be a difficult or very costly matter, and no better provision for a proper and healthy water supply in those parts of Yokohama, which do not possess good wells, can be found than an extension of the present Tamagawa aqueduct.

#### CONDITION OF THE DRAINS.

SETTLEMENT.—The present drainage of the settlement merely provides for carrying off the rain-water from the streets, and must be considered defective as to removal of slop-water and sewage.

Several compounds have not even proper drains for carrying off the rain-water, which collects from the roofs of godowns, tea-firing places and houses. As the buildings are quite near to each other this insufficient drainage causes some houses and godowns to become damp and consequently unhealthy, whilst the goods within the godowns are liable to become mouldy or to be spoiled by the damp atmosphere. The number of houses with proper drainage was 149, whilst 126 compounds had either defective or foul drains and sinks, or no drains at all.

The sinks are, as a rule, not attended to in a sufficient manner; they are often badly situated and not regularly cleaned. There were found 93 foul sinks, full of standing matter, within the Settlement. If a sink be necessary, in case the distance from the sea or the canals is too great to remove the slop-water by means of large drains, then the site should be carefully chosen at a proper distance from the well and from the house. And subsequently the sink should be regularly cleaned and attended to, so that no foul gases escape from the same.

NATIVE TOWN.—The drainage in the native town, chiefly effected by surface gutters made of wood, is of a defective character. In many streets they are badly constructed or not kept in sufficient repair. Several houses only possess a short gutter with a sink near the house, and sometimes the sink is even found within the house. This practice is a very bad one, and ought to be forbidden, as it not only causes the ground under the house to become damp, but also gives rise to the exhalation of noxious gases, which escape from the putrid sediment in the sinks.

The *dobi*, or sink, when necessary, ought in no case to be found at a distance of less than ten metres, or 32 feet, from any house or any well of drinking water.

Of the 4,459 drains in the native town, only 978 answered the purpose, whilst 3,481 drains were either stopped, broken or useless.

#### CONCLUSION AND RECAPITULATION.

##### SETTLEMENT.

1.—Although the houses in the Settlement are, as a rule, not unhealthy, better provision for carrying off the rain-water is necessary in several compounds.

2.—The tea-firing places ought to be better ventilated, and the closets and drainage want more care and better construction.

3.—The outhouses, where the servants live, want, as a rule, better construction and especially greater cleanliness.

4.—Refuse boxes or brick ashpits are desirable in each compound.

5.—The abolition of all defective and dangerous closets with wooden tubs is very necessary; and closets either with pots of glazed earthenware, set in cement, or with iron pails, ought to be adopted in every house.

6.—More regularity in the closet scavenging is necessary.

7.—The water of the wells in the Settlement, even of those wells which are not in a polluted state, is too hard to be healthy for drinking purposes. Extension of the present aqueduct into the Settlement is desirable, and in the new Swamp absolutely necessary.

8.—House drains and sinks want more frequent cleaning.

9.—The numbers obtained by the visitation are as follows:—

Foreign houses (Chinese dwellings excepted).....		292
Filthy compounds.....		12
Tolerably clean compounds.....		200
Clean compounds.....		63
Closets...711	with metallic pails.....	14
	with pot set in cement or with cemented brick wells.....	50
	with movable jars of earthenware, without cement.....	216
	with wooden tubs, mostly bad, dirty or rotten.....	361
	with wooden boxes.....	70
Wells.....251	medium quality not polluted, but hard water.....	91
	polluted.....	71
	wells used for washing purposes only.....	84
Drains...275	dry or not used at all.....	5
	proper drains.....	149
	defective or none at all.....	126
foul sinks.....		93

Number of cholera patients within the Settlement, 17.

##### NATIVE TOWN.

10.—The Japanese houses are built upon too low foundations.

11.—The nagayas and houses rented to the poorer class are usually kept in very bad repair.

22.—The public houses between Uchida-cho and Takashima-cho

require more cleanliness, better privy-accommodation, and general sanitary supervision.

13.—The removal of house-refuse is defective, especially in the streets Uchida-cho, Fukunaga-cho; Nagadumi-cho, Midori-cho, Tachibana-cho and Sakuragi-cho.

14.—The building of impermeable closets ought to be enforced, and regular closet-scavenging promoted.

15.—The wells in all the inspected streets ought not to be used for drinking purposes, as the aqueduct now provides all these streets with far better and healthier drinking water.

16.—The drains and sinks are, as a rule, in bad condition, and ought to be kept in a better state of repair and cleanliness. Sinks should be removed out of the houses.

17.—The numbers obtained by the visitation are as follows:—

Houses .....	4,860
Inhabitants .....	18,016
Clean compounds.....	183
Unclean „ .....	4,677
Closets...4,612	{ properly constructed and clean ..... 425
	{ badly constructed or filthy ..... 4,187
Wells.....653	{ for drinking purposes...153 { not polluted.....153
	{ for cleansing purposes...502 { polluted .....502
Drains....4,459	{ with flow and clean ..... 978
	{ stopped, or broken, or in dirty state ..... 3,481
Number of cholera-patients .....	227

Yokohama, 1st December, 1879.

#### HOUSE-TO-HOUSE VISITATION FOR THAT PART OF YOKOHAMA, SITUATED SOUTH-EAST OF THE HORIKAWA AND NAKAMURAGAWA.

##### TOPOGRAPHY.

The part of the town inspected by us comprises:

TOWN OF YOKOHAMA PROPER.—The Bluff (foreign dwellings), Motomachi, Ishikawa-cho, Ishikawa-naka-machi, Yamamoto-cho, Suwa-cho, Uyeno-cho, Chiozaki-cho.

OUTSKIRTS OF THE TOWN.—Ishikawa-naka-machi, Yamamoto-cho, Suwa-cho, Uyeno-cho, Chiozaki-cho.

On the Bluff 210 houses or compounds have been visited; in the Japanese town and outskirts, 4,837 houses with 13,179 inhabitants. With the exception of Motomachi and Ishikawa-cho, which are situated along the creek Horikawa, all the streets or villages are situated at the hills, or in the valleys between the hills, round the Bluff. The only low-lying part is Ishikawa-cho, Motomachi being of sufficient height above the level of the sea. In Ishikawa-cho there are some swampy and damp parts and several pools of dirty water, which ought to be removed. Especially does that part of Ishikawa where the fish-market is found, call for a thorough sanitary supervision and for the removal of the many stagnant pools which are found there. As to the villages, the soil is, as a rule, good, if the people could be induced to build their houses with higher foundations and not to lay the wooden basement-floors so to lay upon the earth, for it is clear that even in the hills the houses must be very damp, if the air is not allowed to enter and circulate freely under the floors.

##### GENERAL CONDITION OF THE HABITATIONS:

NATIVE TOWN.—The population consists chiefly of the poorer and middle classes, coolies, working-men, peasants and some smaller shop-keepers, very many being evidently so poor as not to be able to keep their houses even in a tolerable state of repair. Most of the houses are merely cottages, and many are in a ruinous and dilapidated condition. But over-crowding does not exist, the average occupancy being not quite three persons for each dwelling. Cleanliness is, however, very deficient, and often wholly wanting.

As we have stated already, all habitations are built too low, the floor nearly resting upon the soil; the ground under the basement floors is very seldom raised, and still more rarely was the same found to be cemented or covered with clay or concrete. Within several houses foul sinks were found, and, as a rule, the people took little or no care to keep the ground under their houses dry and free from rotting organic matter. As it will not cause any significant cost to raise the houses in future a little above the surrounding soil, and to remove sinks from the interior of the houses, it is most important that the local sanitary police should prohibit in future the building of houses upon marshy or insufficiently raised grounds, and also the construction of sinks within the house.

BLUFF.—The soil upon which the foreign houses are built is generally good, and foundations and basement floors are, as a rule, not too low. Dampness does not exist, except in those cases where no protection is made against the rain-water from the roofs flowing near or under the houses. As to the structure of the outhouses near to the foreign dwellings on the Bluff many remarks are to be made. It seems as if the inhabitants neglect the condition of the dwellings of their often numerous servants. Badly constructed, or ruinous or dirty and filthy—servants' dwellings can be seen close to a neat and clean foreign house, the occupant of the latter evidently never looking for the proper and clean state of the habitations of his servants. A few exceptions to this rule exist, it is true; and in these cases, it was evident that the servants themselves took care to keep their rooms neat and clean.

The foreign inhabitants on the Bluff ought to understand that it is, from a sanitary point of view, quite as necessary to look after

the healthy condition of their servants' rooms as after their own houses.

#### CONDITION OF PREMISES, PUBLIC CLEANLINESS.

**NATIVE TOWN.**—The removal of house refuse from the native compounds was often defective. Most of the 4,837 compounds inspected were in a filthy condition, the streets which had the most filthy compounds were Ishikawa-naka-machi, and Yamamoto-cho. Proper ash-pits or refuse-boxes for temporarily storing the refuse are wanting.

**BLUFF.**—At the foreign compounds on the Bluff the removal of kitchen-refuse is also defective. Of the 210 lots inspected, 123 compounds were in a clean, and 87 in a filthy, condition.

Apparently many occupants do not think of having the refuse regularly removed from their premises.

#### CONDITION OF CLOSETS; REMOVAL OF EXCRETA.

**NATIVE TOWN.**—In the 4,837 houses we found only 1,727 closets; in many instances two or more houses using the same closet. Only 16 closets were in a clean state and well constructed, whilst 1,711 closets were either very dirty or badly constructed, with old wooden tubs.

It is one of the greatest necessities to force the people to build less dangerous, impermeable closets, which can be made at a moderate cost with the large Japanese pots of glazed earthenware.

**BLUFF.**—In the foreign compounds on the Bluff 207 closets in all were found, only six houses possessing well constructed closets with a glazed jar, set in a slope of cement. Twenty-five closets with movable stone jars, without a surrounding of cement, were found, and 176 closets were made with the well-known wooden tub; 45 were tolerably clean, although of defective construction, and 131 were in a decidedly dirty or rotten condition. The closets for the servants were as a rule bad, and in several instances too near to the wells.

In the visitation reports, handed by the Committee to each occupant of a house, the construction of impermeable closets has been strongly recommended.

#### CONDITION OF THE WATER-SUPPLY.

**NATIVE TOWN.**—Although the nature and the hilly structure of the soil tend both to produce good drinking water in this part of the town if the wells be properly situated, properly made, and kept in repair, the visitation has proved that, of the 598 wells in the native part of the district, only 256 were free from pollution, whilst 342 wells showed such a degree of contamination by sewage that the water had to be pronounced bad for drinking purposes. Especially in Motomachi and Ishikawa-cho many bad, brackish and polluted wells were found, the water being evidently polluted by the neighbouring salt water canal or by closets, which, by the leaky wooden tubs, allow the sewage to penetrate into the ground and pollute the water of the surface well, or by the sinks and defective wooden gutters which are often found close to the well. Another cause in the bad habit of the people of washing and cleaning everything close to the well and throwing the slop-water simply on the (often broken) wooden boarding round the well. It is clear that much organic matter will mix with, and by decomposition pollute, the water.

Another cause was the wooden well-tube inside the well. When old and in rotten condition it will pollute the water and cause it to contain a large amount of insects besides the products of decomposition of organic matter. If wooden well-tubes are used, they ought to be renewed from time to time, when there are signs of the wood having partly fallen into decay.

Far more attention ought to be given to keeping the wells in proper repair, and especially to keep them from contact with sewage or slop-water. The wells in the lower streets to Motomachi and Ishikawa-cho have originally a tolerably hard water; and near to the creek the wells are evidently mixed with salt water, which makes the water brackish and unfit for drinking purposes; but all the other parts of the native town and suburbs inspected by us have surface-wells possessing originally a soft, good water, as long as the wells are new, and are kept free from outside pollution.

**BLUFF.**—The wells on the Bluff also originally produce a good, soft water fit for drink, ranging between 3–12 degrees of hardness (that is, to say 3–12 parts of Calcium-oxide in 100,000 parts of water). Mostly, the water has no more than 5–7 degrees of hardness, and chlorides and sulphates are only represented in very minute quantities. The red granular clayish soil sometimes causes a slight turbidity of suspended ferruginous clay-particles, which are however innocent and are easily removed by filtration. After careful filtration such water becomes clear and healthy. Of the 190 wells inspected on the Bluff, there were found 127 good wells (seven were of spring water), with no indication of pollution. The number of 59 wells, which, no doubt, originally have also been good, were now found in a more or less polluted state, either by contact with sewage-matter, or with slop-water or with rotten well-tubes inside the well. Four wells were not used or dry, so as not to be of any use. The inhabitants have received from the Committee a report of the analysis of their wells, with such remarks or suggestions as were thought necessary.

The people living at the Bluff can use without any danger the water of the wells there, if they give the required attention to their wells and if they do not let the well-tubes go into decay: if they keep the closets and drains impermeable and at a proper distance from the well, and if they do not allow the servants to wash everything close to the well and throw the slop-water in the immediate vicinity of the same. The straw rope often used for drawing the water can also become a cause of pollution, so that it is recommended to use the black rope—*Kuroi-no-nawa*, which lasts moreover far longer than the straw-rope.

#### CONDITION OF THE DRAINS.

**NATIVE TOWN.**—The drainage is very defective. Wooden gutters badly constructed, often without any inclination or floor, and more-

over kept in bad repair, represent the means of getting rid of the slop-water and storm-water. For the lower parts of the town, Motomachi and Ishikawa-cho, large stone or pottery drains are advisable which could easily lead into the neighbouring creek. For the villages and outskirts, at the hills, it would be well to have short drains with properly constructed sinks in the gardens for the removal of the slop-water, provided the sinks are made at a distance of at least 10 metres or about 30 feet from any well at an equal distance from any house. The very unhealthy and dangerous custom of placing the sink or *dohu* close to the house, or even within the house, ought to be abolished and strongly forbidden. The present wooden gutters are, in fact, nearly useless, and in cases where they are not kept clean and without floor, the foul sediment will emit putrid gases by its fermentation. Of the 615 drains in this part of the town only 30 answered the purpose, whilst 585 were either in a defective or unclean state.

**BLUFF.**—On the Bluff 72 compounds were provided with proper drainage, whilst 136 houses had either defective, dirty or rotten drains or no drains at all.

Many owners or occupants seemed not to care for drains and not to understand that the chief object of drains is:

1.—To keep the house and the ground upon which the house is erected dry (in other words to prevent the rain-water from the roofs penetrating into the ground *under or in the immediate vicinity of the house.*)

2.—To remove the slop-water (from the bathing-rooms and kitchen) in such a manner as not to pollute the well, nor penetrate into the ground in the immediate neighbourhood of the house, nor to deposit a putrid sediment in a neighbouring sink.

As to the sinks they were often found foul; and evidently emptying or cleaning the sinks from time to time was neglected.

The place where sinks were made was in general instances badly chosen.

#### CONCLUSIONS AND RECAPITULATIONS.

Summarizing the results obtained by the inspection we beg to make the following conclusions:—

##### NATIVE TOWN.

1.—That Ishikawa-cho possesses several swampy parts and pools of dirty stagnant water, which ought to be removed, especially the spot where the fish-market is now held.

2.—That the Japanese houses ought to be built with higher foundations and basement floors, and that the construction of sinks within the house should be forbidden.

3.—That the removal of house-refuse from the compounds ought to be better regulated.

4.—That impermeable closets, made with pots of glazed earthenware, set in cement, should be compulsory.

5.—That more care should be bestowed in keeping the wells free from pollution by neighbouring leaky closets, drains or sinks, and that the wooden well-tubes should be renewed when in decay.

6.—That the present wooden gutters are deficient as to proper drainage.

7.—That the committee have found the following numbers.

Houses.....	4,837
Inhabitants.....	13,179
Filthy compounds.....	2,100
Closets.....	1,727 { clean and properly constructed..... 16 unclean and of defective construction..... 1,711
Wells.....	598 { good, not polluted..... 256 polluted..... 342
Drains.....	615 { clean and properly constructed..... 30 unclean or defective..... 585

##### BLUFF.

8.—That the outhouses and servants' rooms on the Bluff require better construction, repair, cleaning and more care from the masters of the houses.

9.—That removal of kitchen-refuse and garbage ought to be better attended to by the occupants of the foreign houses.

10.—That the closets, especially those used by the servants, are very bad, as a rule, and that impermeable closets ought to be constructed instead.

11.—That most wells on the Bluff give good water, but that several wells, which originally possessed good water, have been polluted either by contact with sewage-matter, or with slop-water, or with rotten well-tubes inside the well.

12.—That drainage is in most foreign compounds in a defective condition and requires more attention by the owners or occupants.

13.—That the Committee have found the following numbers.

Houses inspected on the Bluff.....	210
Inhabitants.....	Uncertain
Filthy compounds.....	87
Closets.....	207 { well constructed with cement ... 6 with movable stone-pots without cement..... 25
Wells.....	190 { good, not polluted..... 127 polluted, although originally good..... 59 not used..... 4
Drains.....	210 { proper drainage..... 72 defective, or no drains..... 138

KOISO.

Yokohama, 1st December, 1879.

## JAPANESE NEWS.

[The following Notes on various Japanese matters are chiefly derived from the native papers, occasionally supplemented from original sources of information, and are carefully collated and edited, so as to make them readable and intelligible.]

## GOVERNMENT NOTIFICATION.

## GOVERNMENT NOTIFICATION.

It is hereby notified that His Majesty the Emperor will commence his progress to the city of Kioto, and the prefectures of Yamanashi and Miye, on the 16th of June next.

SANJO SANETOMI,  
Prime Minister.

The 29th of April, 1880.

## COURT, POLITICAL AND OFFICIAL.

His Excellency Matsukata, Minister of the Home Department, returned to the capital on the 23rd ultimo, and has resumed his duties.

It is rumoured that Judge Nakamura Motoyoshi, President of the Joto Saibansho, will be appointed President of the Yokohama Saibansho, succeeding Judge Miyoshi Taizo.

Their Excellencies Yanagiwara, Minister to the Court of St. Petersburg, and Iida, Minister to that of Vienna, will leave for Europe on the 4th of this month.

Mr. Watanabe, Governor of Osaka, arrived in Tokio on the 22nd ultimo. He is reported to be transferred to another position of greater importance.

The *Mainichi Shimbun* says "a new journal to be called the *Kotsu Nippo* will appear from the 1st of this month, Mr. Nakazawa Chikaharu being the editor. We hear that the new journal is to be the Government organ, and if this is really so, we shall in future be able to learn the views of the Government from this paper."

The inhabitants of the prefecture of Wakayama have applied to the authorities, asking that His Majesty the Emperor may visit their locality on his approaching tour. It is probable that the Imperial progress will be extended to the prefecture of Hiogo, and also to the district of Matsumoto in the province of Shinshu.

Mr. Kobayashi, Vice-Consul at Korsacoff, left for his post on the 23rd ultimo, accompanied by an officer of the Finance Department, and some military officers who are going to inspect the place. In order to encourage fishing there the Kioritan Ginko (or the United Bank) propose to establish a fishing company with a capital of 60,000 yen.

It is said that the appropriation for the Daijo-Kwan, hitherto 300,000 yen per annum, has now been increased to 500,000 yen.

Mr. Ishikawa, Sakan of the 3rd class in the Secretary's Office of the Finance Department, will proceed to St. Petersburg in the suite of His Excellency Yanagiwara.

Dr. Ikeda, Messrs. Kodama and Tei, Secretaries, and Mima, Assistant Police Inspector, have been appointed to accompany His Majesty the Emperor on his approaching visit to the provinces.

Mr. Aibara, Under Secretary of Ibaraki ken, left the capital for his post on the 24th ultimo.

Mr. Senator Hayaashi, who went on a visit of inspection to the prefecture of Niigata, returned to Tokio on the 23rd ultimo, and attended the Daijo-Kwan on the following day.

On the 23rd ultimo, Mr. Matsudaira, Governor of the prefecture of Miyagi, was ordered to come up to Tokio immediately. It is rumoured that he will be appointed Governor of Osaka, in place of Mr. Watanabe.

There was an exhibition of No dancing at the Awayama palace on the 27th ultimo, in the presence of Their Majesties the Emperor, the Empress and the Empress Dowager, the Princes of the Blood and their ladies, the Prime Ministers, Privy Counsellors, and a number of the Nobles.

Mr. Maruyama, a shizoku residing at Himeji in the prefecture of Hiogo, addressed a petition to the Prime Minister on the 21st ultimo, respecting the recently issued regulations for public meetings.

Mr. Matsuda, Governor of Tokio, entertained the German Minister and Consul, at the Hall of the Tokio Chamber of Commerce, on Monday last.

Mr. Ishimaru, Superintendent of the Osaka Mint, arrived in Tokio on the 26th ultimo.

One hundred police constables who took part in the suppression of the south-western rebellion, have received rewards in money.

Mr. Nabeshima, Governor of Okinawa Ken (Loochoo), who is now in Tokio, is shortly to return to his prefecture.

It is said that more than forty memorials have been addressed to the Government by the people of different Fu and Ken, demanding the establishment of a national assembly.

Her Majesty the Empress-Dowager is shortly going to summon the female students at the Nobles' School to the Awayama palace, in order to judge of their progress.

His Imperial Highness Prince Arisugawa, the son of the Junior Prince Minister, is now in Hongkong, but will return to Japan about the middle of the present month.

His Excellency Yoshi-i, Assistant Vice-Minister of Public Works, who went to Kiyoshi the other day to purchase building materials for the construction of the new Imperial Palace, is now in Nagasaki, and is expected back in Tokio about the 10th of this month.

His Excellency Matsukata, Minister of the Interior, has been appointed to accompany His Majesty the Emperor, on his coming visit to the provinces.

It is reported that the new criminal code, and the new system of administering justice, are to be promulgated in a few days, but will not be brought into force immediately. It is also said that His Excellency Yanagiwara, Minister to the Court of St. Petersburg, will take copies of the new laws with him to Europe, in order to compare them with the systems in force in the West.

His Excellency Kano, Minister of Education, will entertain the officials and foreign employes of his Department, and the Governor of Tokio and other prominent gentlemen, this afternoon in the library at Yushima.

It is said that Her Majesty the Empress will visit Miyano-shita, Hakone, this summer.

The local assembly of Shizuoka ken was opened on the 27th ultimo; that of Kanagawa ken will meet for the despatch of business about the 10th instant.

Mr. Kataoka, the representative of the Aikoku-sha, who forwarded a petition to the Senate on the subject of a National Assembly, ordered to attend the Senate yesterday.

We learn from native sources that the regulations recently issued are lightly regarded in Sendai, political meetings being held there just the same as usual. On the 22nd of last month, the ordinary lecture was announced at the premises of the Houritsu-sha, and large numbers of pupils from the public and private schools attended. As students are expressly forbidden to be present at any such lectures, the police compelled them to retire from the building, but this had not much effect, as they gathered outside and heard what was going on within just as well as before.

The *Nichi Nichi Shimbun* says, "it is rumoured that it is in connection with the Loochoo question that the Chinese Minister so often visits the Foreign Department, but we cannot vouch for the truth of the report."

## NAVAL AND MILITARY.

A telegram received in the capital states that the *Hiyei Kan* arrived in Corea on the 23rd ultimo, and that the *Asaki Kan* left Kobe for that country at 4 a.m. on the same day.

The monument lately in course of erection at the *Yasukuni-shinsha* (formerly *Shokonsha*) at Kudan, Tokio, in memory of the officers and men of the Imperial Guard who were slain in the south-western rebellion, was completed on Monday last.

The second battalion of the Imperial Guard that recently went north to practise field manoeuvres, returned to the capital on the 27th ultimo.

The *Tsukuba Kan* left Shinagawa for North America at 7.30 a.m. the 29th ultimo. The *Fuso Kan* arrived at Shinagawa on the 25th ultimo, and will be stationed there for a time.

A Japanese man-of-war, having a crew of about three hundred men, is to be stationed at Fusan, Corea, for the protection of Japanese residents. The vessel will be relieved every six months by another. The *Chiyoetsu Kan*, has been selected for the first term of service.

The cavalry of the Tokio garrison are to be augmented by one squadron. The commissariat of the same garrison is also to be increased.

The army student telegraph operators, are to enter upon the course of instruction about the 5th of this month.

Colonel Ibe was promoted to the rank of Lieutenant General, on the 27th ultimo, and appointed to the command of the Hiroshima garrison.

Lieutenant-General Kurakawa has been relieved from the position of President of the Military Court.

His Excellency Oyama, Minister of War, has removed to his residence at Nagatacho.

Lieutenant-Colonel Okasawa, has been promoted to the rank of Colonel.

The War Department is, on and after to-day, to be opened at 8 a.m. and closed at noon, every week-day except Saturday, when the office will close at 11 a.m.

During His Majesty's visit to the provinces, he will witness a sham fight between the troops of the Hiroshima and Nagoya garrisons, at Yokkaichi.

#### INDUSTRIES, TRADE AND FINANCE.

A native paper states that His Imperial Highness Prince Arisugawa, and His Excellency Yanagiwara, Minister to St. Petersburg, have applied to the Colonial Department for permission to purchase a tract of forest land near Hakodate, for the purpose of settling people upon it. Our contemporary suggests that an example of this kind is worthy of imitation by a great number of the Nobles' class, so as to provide a comfortable livelihood for their former retainers.

The Agricultural Bureau has purchased 1,751 *tsubo* of land at Shikoku-machi, Mita, at a cost of 2,621 yen. This ground will be added to the nursery gardens.

The Shin-sui-sha (Match Manufactory) of Tokio, commenced operations about a week ago, power being supplied by a steam engine imported from abroad last year. His Excellency Saio, Minister of Finance, accompanied by his subordinate officers, visited the factory on the 25th ultimo.

The annual produce of all the islands of Loochoo has hitherto been estimated at about 94,230 koku, but according to the investigation made after the establishment of the prefecture, it appears that the amount is over 150,000 koku.

Mr. Hara Zenzaburo has been elected President, and Mr. Ono Kagenori Vice-President, of the Yokohama Native Chamber of Commerce.

Since speculation in rice has been prohibited at the Dojima Rice Guild, the wholesale price of rice has fallen slightly, but no reduction has been made in retail prices. Great suffering has been the result, and therefore the Mitsui Bussan Kaisha and Mr. Shimokawa, a local officer of Tennoji Mura, are going to dispose of a considerable quantity of the grain in small quantities and at a low price, in order to relieve the distress among the poorer classes.

Kwazoku Shimadzu Hisamitsu lately applied to the authorities for permission to purchase a tract of over ten million *tsubo* of land in the Inayeshiro district. The required permission was recently granted, and the cultivation of the land has already commenced.

The *Mainichi Shinbun* contains the following table, showing the difference in the price of grain per koku, in Tochigi ken, in the month of January last year and this year:—

	1879.	1880.	DIFFERENCE.
Rice .....	Yen 6.70	Yen 8.50	Yen 1.80 increase.
Wheat .....	" 6.25	" 9.00	" 2.75 "
Beans .....	" 6.30	" 6.40	" .10 "
Millet .....	" 3.33	" 4.00	" .67 "
Sorghum .....	" 1.30	" 2.22	" .92 "
Buckwheat ...	" 3.10	" 3.71	" .61 "
Rape-seed .....	" 5.00	" 4.80	" .20 decrease.
Sesamum ... }	" 6.60	" 7.11	" .51 increase.
Orientalis ... }			

According to this table cereals have risen, and this is especially the case with wheat, owing to the failure of last year's harvest. Timber has also risen in price, salt is double, and *saké* and *shoyu* have gone up from twenty to thirty per cent. With the single exception of rape-seed, which is slightly lower, every kind of grain has experienced an average increase of about thirty per cent.

Seven or eight junka laden with rice arrived in Tokio from Ise within the last few days, and more vessels with a similar cargo are expected.

The number of visitors to the Kioto Exhibition during fifty

days (from the 1st of March until the 19th of April) amounted to 95,374.

The following is the monthly return of exports and imports at all the open ports of Japan for the month of March last:—

Imports .....	Yen 2,607,879.71
Exports .....	" 1,441,847.59
Excess of imports .....	Yen 1,166,032.12
Custom House duties, and godown rent .....	Yen 176,292.01
Export of money and bullion .....	Yen 1,004,258.59
Import .....	" 143,890.00

Excess of export .....

It is rumoured that speculation in specie in the Tokio and Yokohama Exchange Offices, will be again permitted after to-day, but that speculation in rice will continue to be prohibited until the authorities approve of a code of rules for the guilds.

The first general meeting of the Yokohama Native Chamber of Commerce is to be held on the 5th instant.

A native paper mentions that "a foreign firm is going to buy up tempo and other copper money, at a premium of five or six sen per yen, in consequence of which both the old and new copper money has gone up extraordinarily in value." The same journal also says that "some people are going to purchase the tempo which now cost eighty rin, with the idea of their rising to one sen."

The buildings that are to be insured against fire in Yokohama are as follows:—official buildings, *tsubo* 20,900,262; hospitals, *tsubo* 149.75; buildings joint property, *tsubo* 872,054; those private property, *tsubo* 160,731.185; Shinto and Buddhist temples, *tsubo* 416.84. The total number of *tsubo* amounts to 183,782.986.

A native paper says that about seven or eight hundred thousand silver yen were sold by the Finance Department to the Exchange Office, the Specie Bank, and the First and Second National Banks in Yokohama, on the 28th ultimo. The Specie Bank has advertised in the Japanese newspapers that it is prepared to lend silver at a low rate of interest.

A native paper states that since speculation has been prohibited at the Tokio Rice Guilds and the Yokohama Exchange Office, the number of passengers by the Tokio-Yokohama Railway has greatly diminished, and that the daily revenue from the line is now more than one hundred yen less than formerly.

#### MISCELLANEOUS.

The *Chogyo Shinbun* mentions a report that the Korean Government is going to establish a school for teaching the Japanese Language, and will employ three Japanese teachers. Thirty Korean boys over fifteen years of age will receive tuition.

Three hundred and one counterfeit silver coins have been forwarded to the Shihosho from the Kumamoto Saibansho.

It has been known for sometime that the precious metals were to be found in Tombo-yama, at Ikeda in the province of Settsu, but it was supposed not in sufficient quantity to make mining remunerative. However, some persons in the locality obtained permission from the Government, and commenced prospecting the hill at the beginning of last month. The success of these pioneers has been so encouraging, that another party has applied for permission to prospect Tenguyama and operations will commence there at once. It is expected that the new mines will prove more productive than those of Ikuno.

The new periodical, the *Meiho Shinshi*, made its first appearance on the 24th ultimo.

Mr. Ozaki, secretary of the first class, attached to the Japanese Legation in St. Petersburg, has been married in England to an English lady, Miss Williams.

Mr. Shibasawa, President of the First National Bank, left for Osaka on the 24th ultimo.

A native journal mentions that in consequence of the rise in the price of rice, every night twenty or thirty houses are set on fire in Osaka and countless robberies are committed both secretly and by violence. All commodities having greatly increased in price, the poorer classes are almost in want of the means of subsistence, and in such localities as Takatsu-Shinchi, Tennoji Mura, Namba Mura, &c., the people are going to restrict themselves to two meals daily instead of three.

Mr. Matsumoto, the editor of the *Fukushima Mainichi Shim-bun*, has been fined ten yen for a breach of the Libel Laws.

As the Tokio-Takasaki Railway will run from Yatsuyama, Shinagawa, and Takasaki, Joshiu, the Tokio terminus is to be built at the former situation of the Obata yashiki.

A telegram, dated 6.55 p.m. on the 25th ultimo, to the Board of Health from Ishikawa Ken, announces that a case of cholera occurred at Aioi-cho, Fukui, in that prefecture, at 2 p.m. on the 24th ultimo, which ended fatally at 6 p.m. on the same day. A report addressed to the Board from Okinawa Ken, under date the 9th instant, states that disease has been prevalent among the pigs in the neighbourhood of Nafa, since the end of February, and that up to the close of last month more than a hundred had died. The disease is reported not to have spread to the surrounding districts, nor to be increasing in intensity.

The fishermen in the districts of Aki-gori and Hata-gori, in the province of Tosa, assembled in large numbers and created a disturbance in consequence of the rise in the price of rice. The police succeeded in restoring order.

A fire took place at Nichi-Furukawa-machi, Koishikawa, Tokio, about 3.10 a.m. on the 28th ultimo, and quickly spread in different directions. Several streets, comprising about eight hundred houses, and one bridge were destroyed; and eighty-five houses were damaged before the fire was extinguished at 5.30 a.m. A number of people were killed and injured.

The Japanese Government has leased about 30,000 *tsubo* of land in the newly opened port of Gensan, Corea, for a Japanese settlement, and is going to grant the land to Japanese residents for ten years, free of charge. Each tenant will also receive five hundred yen towards the expense of erecting buildings, which sum will be repaid in ten yearly instalments without interest. Many inhabitants of Kiushiu have applied to the Government for building sites at Gensan, and at last advices there were only about thirty or forty *tsubo* of unleased land left. There is an island called Matsushima on the coast of Hamana in the province of Iwami, Shimane Ken, situated not very far from the coast of Corea. No one has yet settled on this island, but as there is a good supply of timber upon it, Mr. Chikamatsu, accompanied by about eighty wood-cutters, lately left for the purpose of cutting down the trees and exporting the timber to Gensan, for use in buildings. A Buddhist temple is to be built at Gensan at an estimated cost of about 125,000 yen.

Lieutenant Iwamoto having been charged with robbery, has been arrested and sent to the Third Section in the Police Department.

A telegram from Hakodate on the 29th of April, states that a strong south-easterly gale began to blow at about 11 p.m. on the previous night, and destroyed four houses and damaged the same number of buildings. Several other places were also injured, but no people were hurt. The gale had ceased at the time the telegram was despatched.

Akashi, in the province of Harima, was visited by a very heavy gale on the 26th ultimo. The sea ran mountains high, and washed away seven or eight houses on the beach. Three or four women were killed and several others severely injured.

#### IMPERIAL GOVERNMENT RAILWAYS.

Miles open 47.	

#### ARRIVAL OF THE ENGLISH MAIL.

Kabul, 19th March.—The people of Maidan have told Abdul Wahab Shahiozadi that they can take no part in any further action against the British for fear of their displeasure, and have requested that chief to transfer himself to Argandli. Three hundred sheep came in from Maidan to-day from the Logar. Supplies are coming in freely. Mahomed Hussein Khan had reached Parak, but fearing lest he might fall into our hands has gone back to Padkhow. Mir Butcha has written to General Mir Said Khan at Istalif, telling that chief that he would join him in a few days to attack Shahbaz Khan. Reports from Karez-i-Mir represent the people as wishing to give all their time to their crops and as not at all inclined for any further fighting. In the city, also, it is generally held that any further attempts in arms against the British will be futile and impolitic. General Sir Frederick Roberts went to Lataband this morning to inspect the road, returning to Shurpur in the afternoon. The 24th Native Infantry and Battray's Sikhs marched in this morning from Butkak and camped on the Sia Sung heights, close to the fort. Mr. Lopel Griffin and party arrived to-day from Lataband.

Kabul, 19th March.—The Cavalry reconnaissances are being lengthened daily, now that the ground is getting fit for the movements of troops. All is quiet round Kabul, and supplies are being brought in at Kandahar. A non-commissioned officer of the 25th Sikhs was killed on the 19th by a Ghazi in the cantonments. The Ghazi was also killed.

Kabul, 21st March.—General Gholam Hyder has arrived at Dask-i-Safed with 6,000 men and 12 guns. His presence there with such a force is said to please the people round as securing them from small petty quarrels. Shahioz Khan has gone with 800 men from Balu Kesh Kar to Kulm Chuk. Two or three days ago hard fighting occurred at Nagi beyond Ghuzni. The Hazaras captured four forts there, killing all the men and carrying off the women. Mahomed Jan is said to have gone out against the Hazaras to obtain reparation. Supplies of flour, jowari, salt, &c., are coming in freely.

Kandahar, 21st March.—Orders have been issued for the advance of General Stewart's division on Ghuzni via Khelat-i-Ghilzai. The division will march in two columns by the Turnak and Afghannistan valleys as far as Khelat, and from thence by columns moving in parallel lines within heliographing distance of one another along the left and right banks of the Turnak as far as Shahjai, where they will join and proceed together to Ghuzni. The right brigade under General Barter leaves on the 29th, the main body and head-quarters three days after that. Great assistance is expected from the Hazaras on the onward march, and the supplies are reported as plentiful, and the troops are in excellent health and spirits. Major Ennis Smith accompanies the division as political officer. Colonel St. John will remain here as Political Agent for Southern Afghanistan. There have been several cases of Ghazeeism here lately. In all cases but one, in which the Ghazees killed a naigue of the 25th Punjab Native Infantry, the Ghazees have been killed without doing any damage. A bandsman of the 29th was murdered last night by some robbers near the Eedgah Gate. He was alone and his body was not found till this morning. Sirdar Sher Ali Khan accompanies Sir Donald Stewart as far as Khelat-i-Ghilzai. An attack on a sergeant of Artillery was made by a boy with an axe in the cantonments yesterday. The boy was cut down. A private of the 59th was murdered last night in the town and his body horribly mutilated. The Tarrakies are supposed to be fortifying Mulkoor.

Calcutta, 21st March.—Mr. Lopel Griffin was to reach Kabul in the afternoon of the 19th. General Roberts was to ride out to Lataband to meet him.

Allahabad, 21st March.—News from Lataband on the 18th states, that General Roberts was expected on the 19th. Mr. Lopel Griffin had already arrived, and intended to leave with General Roberts for Butkak. Some shots were fired into the camp on the previous night, but nobody was injured. Thull news says that Dr. Dale, the Principal Medical Officer, has arrived. The 5th Native Infantry was proceeding to Koorum, relieved by the 13th Native Infantry. Sir Frederick Haines left Calcutta yesterday for Peshawar. His Excellency halts at Umballa on the 23rd.

Allahabad, 21st March.—Lieutenant-Colonel Hills, R. E. (Bombay), has arrived at Kandahar to take charge from Lieutenant-Colonel Hitchens (Bengal). Lieutenant-Colonel Gordon commanding the 63rd, stationed at Umballa, is dead. This makes the seventh officer lost within fifteen months.

Calcutta, 21st March.—The Hon. A. Wilson has been appointed Vice-Chancellor of the Calcutta University in the place of Sir J. Arbuthnot, who left yesterday for England. The formation of a subordinate branch of the Quarter-master-General's office for intelligence is sanctioned. The Punjab Volunteers have been formed into three administrative battalions with Sir R. E. Egerton as Honorary Colonel.

Calcutta, 22nd March.—Brigadier General Phayre is to command the line of communications; Brigadiers General Burrows and Brooke, the two Infantry Brigades at Kandahar.

Allahabad, 22nd March.—Messengers from Turkistan bring conflicting reports as to the whereabouts of Abdul Rahman. It is generally believed that he has not yet reached Takht-i-Pul. A messenger from Ghuzni from Musa Jan says that, in accordance with General Roberts' wishes, he has ordered all the Sirdars with him and the headmen of Wardak and districts, together with Mir Bateha Khoistani, Hossain Khan, the ex-governor of Jellalabad, the headmen of Logar and the Kohistani chiefs, to proceed to Maidan for a conference. The messenger added that the tribal leaders want Musa Jan to be made Amser, or else Yakool to be recalled. The Brigadier Commanding the 4th Brigade will be Colonel Roberts of the 5th Fusiliers. Sir Frederick Haines's departure for Afghanistan is indefinitely postponed. The headquarters remain at Calcutta till further orders. Sir R. E. Egerton will return to Lahore from his tour by ordinary train from Jhelum on Wednesday.

St. Petersburg, 28th March.—Another secret press has been discovered by the police here, and 16 persons have been arrested in connection therewith.

London, 29th March.—Latest advices from South America state that the allied Peru-Bolivian forces have defeated the Chilean troops in an action fought at Moquegua, with a total loss of 1,300 men.

### THE JAPANESE PRESS.

#### THE SUSPENSION OF SPECULATION.

(Translated from the *Aikono Shimbun*.)

ON the 12th of April instant, the Minister for Finance suddenly issued an order to the Stock Exchange Offices and Rice Guilds throughout the country, prohibiting the purchase or sale of specie and rice until further notice. This action of the Minister involved very important questions, and consequently attracted great attention. Some people expressed themselves to the effect that the order exceeded the Minister's powers; while others again thought that the notifications were attended with a prejudicial effect to the mercantile classes, whose freedom of action is thereby curtailed. Animated discussions have arisen on the subject, but they are nothing more or less than a reflex of the opinions ventilated in the Exchange Offices and Rice Guilds. We are aware that the reason why the Minister for Finance adopted the strong measure we have mentioned, was in consequence of the speculation which has taken place being considered responsible for the great increase in the value of both specie and rice, to such an extent that no one could discern where it would end unless checked at once. This being the case it becomes our duty to consider whether or not the action of the Government will prove a remedy for the mischief.

Does the rise in prices result from natural causes? And, if so, is it within the power of anyone to control it? Here we have two questions which may also be put thus—Can any individual raise or lower the current prices? And is there any other cause for the abnormal increase which has lately taken place? It is quite evident that no speculator can operate unless an opportunity presents itself to him. Take land and water for an example. No one, however skilful, can turn water into land or rice *terra*, and this is precisely the case with speculators. As an instance we may mention that the swords manufactured by Masamune, Yoshimitsu, &c., were of great value during the feudal system, and it was natural that this should be so.

But as soon as the *Han* were abolished and *Ken* established, the price of swords fell, and then, when an order was issued prohibiting the carrying of swords, there were no buyers for them at all. This also was a natural result. No matter how astute a speculator might be, it would have been impossible for him in the days of feudalism to reduce the price of a good sword by Masamune to next to nothing, or to raise the price now to what it used to be formerly. We are of opinion that the present extraordinary rise in the value of specie and rice proceeds from natural causes also, but, nevertheless, speculation may have contributed in no small degree to assist in the increase. The measures of the Finance Minister were, no doubt, directed to the annihilation of the fictitious value supposed to exist, and we at once directed our observation to the next step of the authorities.

After the order was promulgated, both specie and rice declined in value, but only for a few days, as the former quotations were quickly resumed and there does not appear at present any sign of a fall. In fact, the rice already contracted for still remains firm at over ten yen per koku.

Judging from the quotations, it is plain that rice and specie used formerly to rise and fall in company, but quite recently there has been a slight decline in specie, without any corresponding fall in rice. Some account for this by asserting that a number of wealthy merchants, having convinced themselves that rice was not run up to a fictitious value through speculation, have made very extensive purchases in the belief that the Finance Minister's order will be speedily rescinded, but of this we have no information either one way or the other. On the other hand, although the value of specie has slightly declined in consequence of the prohibition of speculation, still it is impossible to predict with accuracy what may take place at any moment in the money-market. If, as we expect, specie and rice increase more and more, and paper currency continues its downward course, the country will get into such a sea of difficulty that it will be impossible to find a remedy. The inhabitants of Japan will find it increasingly difficult to obtain a livelihood, pauperism will spread, and the habits of the people will surely become demoralized. In fact the ultimate result will be, that we will relapse into a state of savagery. If the increased price of specie and rice can be controlled by the mere prohibition of speculation, we need have no fears for the future, but when, as we have noticed, there is a natural law governing these matters which no human agency can dominate, how can we remain silent on so serious a subject?

We shall attentively watch the course of events and comment upon them from a practical standpoint.

#### IS AN OFFENSIVE ALLIANCE BETWEEN JAPAN AND CHINA DESIRABLE?

(Translated from the *Hochi Shimbun*.)

SOME time since when the Government of Japan established the prefecture of Okinawa (Loohoo) the ire of the people of China was aroused, and many severe criticisms were passed upon the measure by the Chinese newspapers. In Hongkong and Shanghai the question involved furnished matter for daily comment, and the *Sin-pao*, of Shanghai, strongly urged the authorities of China to refer the settlement of the dispute to the arbitration of the sword. While the discussion was in progress we frequently published the views expressed by the Chinese, so that it is more than probable the matter still remains fresh in the memory of our readers.

Now, however, a dispute has taken place between Russia and China respecting *Uli*, and war is about to break out. This has caused a complete change in the views of the papers in Hongkong, and Shanghai and we find them all advocating an offensive alliance between Japan and China for the express purpose of opposing Russia. The *Sin-pao*, in particular, has frequently of late urged the desirability of such a coalition, the following being a précis of its views on the subject:—"The empire of Russia embraces portions of both Europe and Asia, but it is in the latter continent that Russia desires to acquire a greater extent of territory. Having regard to the situation of Asia, the Middle and Eastern Empires (China and Japan) should as-

sist one another, the relations between them being as intimately connected as the teeth are with the lips. If the two nations form a coalition they can defend themselves against all comers and restore the status of Asia, but, on the other hand, if they elect to follow an independent course their power will be divided and other countries will easily prevail over them. Owing to the Loochoo question, friendly relations do not exist at present between China and Japan, and, if each party continues to insist that its contention is just, there seems no likelihood of the dispute being ever amicably settled. The possession of Loochoo is a trifling matter to both empires, but it affects their honour, and therefore the quarrel is prolonged. However, to return to Russia. Japan and China are like two brothers, and, as the old saw has it, 'brothers may quarrel between themselves, but they join for mutual defence against strangers,' so it should be with the two Asian empires. If, in consequence of the miserable wrangle about Loochoo, no alliance can be made and the present dispute is maintained, it is much to be deplored, as the point at issue only affects the honour of the two nations. The Loochoo question is a mere trifle, while the impending danger from Russia is of grave moment. If the Loochoo embroglio prevents a coalition between China and Japan to oppose Russia then we can only liken the two empires to a king-fisher and a shell-fish which, quarrelling together, both become the prey of the fisherman." These are the views of the people of China who are anxious to promote an alliance between Japan and China against Russia, in consequence of the Ili affair, as propounded by the journal which a short time ago urged, in most intemperate language, the authorities of China to wage war with Japan respecting Loochoo. The probability of a rupture with Russia has apparently completely modified the policy of these gentlemen, as they now desire peace and an offensive alliance.

We do not blame the Chinese for this sudden change of feeling: in fact, we put it down to their patriotism and admire them accordingly. No doubt there is much truth and good sense in our contemporary's remarks, but we should like to make a few observations from our point of view.

We are highly pleased to learn, on such good authority, that the Chinese have discovered what a trifle the Loochoo question really is, and that they desire to cultivate friendly and close relations with Japan. But it must be remembered that it is utterly impossible for Japan to enter into an offensive alliance with China for the purpose of opposing Russia, for the simple reason that any such alliance would be a grave breach of international law. The Chinese may, perhaps, be apprehensive that we will join Russia in consequence of the dispute about Loochoo, but the same reason which prevents us from entering into an alliance with China, is equally operative as regards Russia. No matter how great our affection may be for one country more than another, the laws laid down for the guidance of all civilized states in their international relations must be strictly adhered to. If we were to act otherwise, we should incur the active hostility of every country in the world. For this reason, we must observe a strict neutrality when war breaks out between China and Russia; not that we are hostile to the Chinese, but because it will really be more beneficial to them for Japan to observe the common law of nations, remain neutral, and thus leave China with Russia alone to deal with, than it will be for Japan to enter into the desired alliance, thus violate international law, and bring down upon the two Asian empires the hostile forces of the world. It appears to us, that the views of the Chinese writers on this subject are similar to those which obtained in the times of the Sengoku (the feudal princes of China who were always at war with one another) and that they are unacquainted with the theory of the indirect balance of power which is kept up among civilized states. The peace and safety of China depend, in great measure, on a proper knowledge of that theory, but the question is so abstruse that we will gladly leave it, and proceed to make a few observations which may have the effect of reassuring our Chinese neighbours.

China is one of the most powerful nations in Asia, and, although her territory is not so extensive as that of Russia, it is infinitely more fertile. According to the statistics of the year 1873, the population of China is 425,000,000 while that of Russia is only 85,685,900. It is evident, that, hav-

ing regard to territory and population, China is capable of being a formidable foe; how then comes it that she is afraid to oppose Russia, unless in conjunction with Japan?

If the people of China only reflect, they will find that, as they are possessed of all the necessary resources, it is entirely their own fault if they are unable to make head against Russia. If they abandon their old-fashioned ways and adopt modern improvements, they will establish the power of their Empire on durable foundations, and be for ever secured from the humiliations to which they are now so constantly exposed.

## LAW REPORTS.

### IN H. B. M.'S COURT FOR JAPAN.

Before MARTIN DOHME, Esq., Acting Assistant Judge.  
Tuesday, the 27th day of April, 1880.

Mañi, a native of Singapore, was charged on remand, for that he, on the 18th day of April instant, unlawfully stabbed one Katchung, a seaman on board the P. & O. Company's steamer *Sunda*, with intent to do him grievous bodily harm.

Mr. Henry Crano was sworn as interpreter.

The prosecutor deposed: On Sunday, the 18th of April instant, I was sitting quietly in a Japanese house in the native town at about 11 o'clock at night, when the prisoner came up and stabbed me in the back. About an hour before, prisoner and Cassim had been quarrelling about something, but I had done nothing whatever to provoke his anger. He stabbed me with a table-knife.

Prisoner declined to ask the witness any questions.

Cassim, also a seaman, deposed: At about 11 p.m. on Sunday, the 18th instant, I went to a house in the native town to take supper with the prisoner. While we were having our meal the prisoner suddenly drew a knife which he had concealed under his clothes, and attempted to stab me. I escaped being wounded by seizing prisoner's hand in which he held the knife. The prisoner then went for Katchung and stabbed him. I saw prisoner stab Katchung. He stabbed him in the back. Katchung had given him no provocation whatever. I am quite sure the prisoner is the man who stabbed Katchung.

The prisoner also declined to ask this witness any questions.

Edwin Wheeler, M. D., deposed: On last Monday week I was sent for to go on board the P. & O. Company's steamer *Sunda*. I found the prosecutor Katchung with his arm in a sling and having an incised wound, evidently produced by a knife, on the right side of the back just below the inferior angle of the scapula. It had not penetrated the cavity of the chest, owing to the knife being turned aside by a rib. I saw Katchung this morning. The wound is now closed up. The man can be discharged from hospital to-morrow.

The prisoner, in reply to the usual caution, said: Before going to the eating-house, I had an ill-feeling against the witness Cassim, which was caused by his having said all sorts of things about me. It is not true that I stabbed Katchung, nor is it true that I attempted to stab Cassim. I had no knife in my hand. Cassim and I were both intoxicated. Katchung was also drunk. He had been fighting with some Europeans that day. His face was all swollen, and his friends knew that he had been fighting with Europeans that day.

The prisoner was committed for trial.

## THE TIMES OF THE TAIRA.

By CAPTAIN F. BRINKLEY, R.A., AUTHOR  
OF THE "TIMES OF TAIKO."

### CHAPTER XLVII.

#### THE END.

Hiidehira, Earl of Osbin, had borne his weight of years so stoutly up to the moment he was overtaken by his mortal malady that his sons and liegemen scarcely realized the possibility of his death even when summoned to receive his dying behest. "I have lived," the old nobleman said, "not unhappily nor yet I think entirely without honour, and leaving behind me men fitted to fill my place, I had hoped to

take my leave of life with a light heart. But the Gods have ruled otherwise. I discern in the future a shadow that darkens this my last hour, and will, I fear me, one day altogether eclipse the glory of my house. For before I shall have been many months in the grave, there will come to you messengers from the south, offering you the province of Hitachi in exchange for the head of our guest, Yoshitsune, and if it fall out by any evil chance that you lend an ear to these promises, you will assuredly lose all that your ancestors have left you for the sake of adding to it more than they desired. Remember well this my last counsel. Let your answer to Yoritomo's proposals be the decapitation of their bearers, for so long as you yield not to persuasion, you will have nothing to fear from force."

These words were spoken one winter's morning three years after the occurrences related in the last chapter. Yoshitsune was now living in Oshiu, whither he had lately fled from Kiyoto, encountering by the way perils from which his escape seemed almost miraculous. After the discomfiture of the cenobites at the river Yoshino the Genji knights, recognizing the impossibility of continuing their journey north in company, had reluctantly obeyed their leader's injunctions to separate and provide each for his own safety. Not even Benkei and Saburo were exempted from this arrangement, and Yoshitsune, with only one attendant, had made his way to Nanto and taken refuge at the cloisters of Totaiji. It is not impossible that his ultimate intention in choosing this asylum was to abandon the world where he had won so much glory and so little happiness. Such at any rate seems to have been the abbot's idea, who employed every device of argument and eloquence to mature his guest's supposed design, but without success. Still cherished hopes of a reconciliation with his brother; the memory of Shidzuka and his unborn child; the promise he had made to his liegemen at parting, and perchance some remnant of the ambition he cannot entirely have laid aside, kept him ever undecided, and while he wavered an accident deprived him of the power of choice. He was waylaid one evening in the vicinity of the cloisters by a band of friars who emulated Benkei's reputation as a sword-stealer. The result is easily described. Five of the disguised cenobites were killed and the sixth escaped with his ears lopped off and his nose slit: escaped to bruit abroad the story of Yoshitsune's presence at Totaiji, and to carry false reports of his doings to Kiyoto.

The abbot would still have sheltered his guest at any cost or any risk, but Yoshitsune, never content that others should suffer for his sake, peremptorily refused all offers of aid. Returning to the capital he lived there for some months in concealment, until once more seeing that although he was able to elude his enemies' search it was at the expense of constant misfortune to his friends, he resolved on a final attempt to fly northward.

It seemed a well-nigh desperate essay. On all the main routes, at every mountain pass and seaport in the empire, guard-houses had been established, and their captains provided by Kajiwara's care with accurate descriptions of Yoshitsune's person. Whether by sea or shore there was absolutely no way of evading this vigilance, and when the proscribed man summoned his old comrades to aid him in his hopeless enterprise, he may well have doubted their willingness to obey. This pain was, however, spared him. Everyone of the sixteen responded with delight to their leader's call, so that of those stout soldiers who had shared his first flight from the capital, Tadanobu alone was wanting. He, indeed, betrayed by those he trusted and not unwilling to keep speedy tryst with his liegemen, had died by his own hand in Kiyoto after a desperate struggle against overwhelming numbers, but the story of his gallant resistance in the valley of Chiun, and subsequent escape from the midst of his enemies, had shewn of what things such warriors as he and his comrades were capable.

Of the adventures Yoshitsune and his followers encountered on the road between the southern and northern capitals, it must suffice to say that they form by no means the least wonderful portion of our hero's eventful career. The knights were disguised as travelling priests, and accompanied by the daughter of the late Lord Deputy, a girl of scarcely sixteen, whom in obedience to an ancient promise Yoshitsune had taken to be his wife. He would assuredly have spared her the toil and exposure of such a journey

had not bitter experience made it easy to predict her fate if left alone at Kiyoto. She could not expect to fare even as well as Shidzuka who, carried to Kamakura by Yoritomo's orders, had been at first condemned to have her unborn child taken from her, and only saved from this merciless sentence by the intercession of those who remembered the signal mark of favour she had formerly won from the gods themselves. None, however, had been able to obtain any indulgence for the child. Yoritomo directed that it should be exposed the moment it was born, and to all her previous sufferings Shidzuka had added the anguish of seeing her baby's face only in death. Well might Yoshitsune's girl wife choose to encounter any hazard rather than this. To travel two hundred leagues on foot dressed as a page; to look death in the face day after day; to be overtaken by the pangs of child-birth on a mountain far away from any human habitation: all this was as nothing compared with the very contemplation of the things that might have been, and surely never did baby find better or more tender-hearted nurse than Benkei proved in the last days of their journey, to the boy born under such strange circumstances.

In Oshiu the fugitives found a welcome that far exceeded their utmost expectations. Hidehira had loved his own sons no better than the lad whose boyish aspirations and noble purpose he had been the first to foster, and when all Japan rang with the fame of Yoshitsune's deeds, the glad old earl had been hardly restrained from buckling on his harness and riding south himself to see such lusty sport. Neither was he one of those whose affection ebbs and rises with the tide of fortune. Had the Lord Constable himself visited Oshiu with all the pomp and circumstance his then illimitable power might command, he would not have received a title of the honour done to these sixteen men, who way-worn and well-nigh destitute came to pray for the charity men were prohibited from extending to them on pain of death.

Here then during two years Yoshitsune found, if not happiness, at least security, and it is not wonderful than standing beside Hidehira's bier at the end of that time, he compared himself to one who, wandering in a pathless waste at midnight, sees the clouds close over the last star that might have served to guide him. His only hope now was in the loyalty of the old Earl's sons, but though these had sworn to obey their dying father's injunctions, events soon shewed that their oath was little reliable.

The castle which had been assigned to Yoshitsune as a residence was one of the strongest in the northern provinces, and had he desired he might easily have assembled there such a garrison as would have rendered it well-nigh impregnable. But he clearly understood that his safety depended not on his own strength but on the good faith of those among whom he lived. His life was absolutely in their hands, and to shew that he mistrusted them would be the surest way to forfeit their protection. The sixteen men who had followed him from Kiyoto were therefore his only guards, and neither in his manner of life nor theirs could any have discovered the smallest evidence of apprehension or unwelcome watchfulness. They took whatever the day brought forth, joining in chase, tourney, revel or foray with equal indifference, and had any evil design been on foot, it would have found them unprotected and seemingly unsuspecting.

Of Hidehira's sons the eldest, Yorihiro, far excelled his brothers in physical and mental endowments. Few indeed of the northern knights could hold their own against him with bow or sword, and partly from this cause, partly for the sake of his frank and loyal nature, Yoshitsune had conceived for him a friendship which the old Earl's death rather strengthened than diminished. Now Yorihiro had been born before his father was sixteen years of age, and thus though well fitted to succeed to the earldom, it had been considered expedient to set him aside in favour of his younger brother, Yasuhira. He himself had never rebelled against this decision either by word or act. It seemed to him perfectly right and natural, nor did he much care to whom the title descended provided it was to one of his own kith and kin. But this very complaisance, being incomprehensible, was suspicious. His brothers could not believe him content and finding fresh grounds for mistrust in his intimacy with the Minamoto exiles, they resolved to set the question at rest once and for ever. An opportunity was easily found. On the hundredth day after Hidehira's death,

when his family were all assembled to perform the funeral ceremonies, Yoritomo was treacherously seized and executed with all his children.

Yoshitsune did not fail to perceive the bearing of this act upon his own fortunes. When setting out from Kiyoto three years before, he had received from the Emperor an autograph letter, empowering him to claim the armed assistance of the brothers Koreto and Kareyoshi, two of the most puissant barons in the Island of the Nine Provinces. This he now despatched southward with an explanation of his helpless condition and an account of the perils with which he was menaced.

It boots not to inquire whether he was betrayed or his brother exceptionally well served. The letter at any rate fell into Yoritomo's hands, and its import, being willfully misinterpreted and largely exaggerated, supplied Yoshitsune's enemies with a fresh pretext for urging his destruction. The Lord Constable desired to despatch an army northward without delay, but it was pointed out to him by Kagiwara and other not less astute commanders that such a proceeding would compel Yasuhira to espouse the proscribed man's cause, and that with Yoshitsune as their general, the Oshiu troops might hold all Japan at bay for a century. It was resolved therefore to adopt a more subtle method, and before the days of mourning for Hidehira were completed, the things he had foretold came about. A delegate from the court of Kamakura arrived in Oshiu, empowered to exchange the fief of Hitachi in perpetuity against the head of the Minamoto fugitive.

Hidehira's death had taken place in the month of December, and in May of the following year his sons organized a hunting expedition on an exceptionally large scale. Yoshitsune was invited to join the party, and being as yet without any definite cause for mistrust, he readily consented to do so. He was ignorant of his own messenger's miscarriage as well as of the southern delegate's coming, and neither he nor his followers seem to have had any suspicion of treachery.

Just as he rode out of the castle gates, however, a letter was placed in his hands. It bore the signature of Motonari, Hidehira's father-in-law, and this was its purport: "The earl's dying prediction approaches its fulfillment: When I tell you that an envoy from Kamakura reached Oshiu five days ago, your own ignorance of the event will enable you to divine the nature of his reception. In this hunting expedition you are yourself the quarry, and I pray the gods that it be not already too late for you to fly. Brother of the man\* for whose sake your father died, and your fellow exile, I would fain follow you wherever you turn your steps, nor stay here to witness the evil deeds of my grandsons, but this may not be, seeing that I am now more than three-score. May Hachiman guide you to some better fortune and guard you from the guile that sets valour at naught!"

Yoshitsune read these words twice over without betraying any symptom of surprise or alarm. "At home or at the hunt, it matters little which," he said as he turned back to the castle: "the end is the same wherever it overtakes us." Then summoning his sixteen liegemen, he read to them Motonari's letter and the reply he had just written:—

"If indeed it were in my power to escape, I might even now persuade myself to make the attempt, in order that men should not be able to lay this crime to their charge whose father bequeathed me so large a debt of gratitude. But both I and my companions have had over-much of flight and evasions; neither in heaven nor earth is there any place to which the ban of proscription does not extend. Here, therefore, we shall await our fate whatever it may be, grieving only at this, that we can neither repay nor profit by your kindness."

To this resolution every one of the sixteen assented unhesitatingly. Since the end was inevitable the remnant of their lives might be passed more comfortably where they were than in repeating the bitter experiences of bygone years. Nevertheless for their leader's wife and child they would fain have devised some means of escape. Among the mountains of Nikkwo, where Saburo's youth had been spent, perchance in the very place where Iné had received her unknown visitor in the days when the future was all brightness, some retreat might still be found beyond the

\* Nobuyori, whose feud with Kiyomori led to the downfall of the Genji.

reach of vengeance and intrigue. For such a purpose as this Saburo could not but consent to survive his lord, and with him as escort the chances of successful flight did not seem small. But when this scheme was made known to Shigeeko, she prayed with such passionate earnestness not to be separated from her husband that Yoshitsune could not find it in his heart to insist. She had indeed suffered sufficiently in the past, and might well claim the right to share his journey to the shades without whom life would have seemed intolerable.

Nothing therefore remained but to await the course of events with what patience they might. They did not attempt to make any preparations for defence, nor even to devise a plan of action. It was tacitly understood that they should sell their lives as dearly as possible, and for the rest, they had fought side by side so often and in such sudden emergencies that to take any forethought now seemed scarcely necessary. Yoshitsune too issued no directions, nor in any way changed his manner of life. One indication only of his purpose was afforded. He caused a number of faggots to be piled under the verandahs of the main building and desired that fires should be kept constantly burning there.

On the morning of the third day after the receipt of Motonari's letter, the watchman in the tower reported the appearance of a large body of troops to the south of the castle. They were advancing at a leisurely pace and evidently with no desire to conceal their approach, which indeed it would have been difficult to do, seeing that their numbers amounted to some fifteen thousand. Fully an hour however must still elapse before the head of the column came within bow-shot, and in the interim the sixteen Minamoto knights assembled to take leave of their leader and one another. The ceremony was conducted after the simplest fashion and without any display of emotion or any allusion to their impending fate. Benkei, only, as he received the wine cup from Yoshitsune's hands and drained it for the last time upon earth, said with his old jovial laugh:—"The varlets have done us much honour, my masters, in measuring our strength at one to a thousand. May we have proved to them before we meet again that their estimate was not mistaken!"

Yoshitsune, who had not yet armed himself, now desired his followers to ascertain, if they might, who were the leaders of the attacking force. He did not believe it possible that Yasuhira and his brother could have persuaded themselves to conduct so nefarious an enterprise in person, and finding his conjecture correct, he declared his intention of abstaining altogether from the fight. He would not draw his sword for the last time, he said, against those who were only obeying the orders of their superiors, nor receive his death-stroke at the hands of men unworthy of his steel.

The others did not attempt to turn him from his decision. They knew that it could not be otherwise, and one by one as they took their leave, they prayed his pardon for preceding him to the grave.

Even now they did not hold any consultation about the disposition of their force. By a sort of tacit understanding fourteen mounted their horses and rode towards the gate, while the remaining two ascended to the roof of the main building and stood there sword in hand. Of these one was the uncle of Yoshitsune's wife. He was the only man of their leader's kindred present in the castle, and the part that devolved on him in this last drama made it necessary that he should remain at Yoshitsune's side to the last.

When the fourteen issued from the court-yard, they found that the enemy's van was already within half a furlong of the portals. Had the ground been favorable for attack, such an overwhelming force as Yasuhira had sent must have borne down every obstacle, and decided the contest forthwith. But the one road that led to the main gate was constructed along the crest of a bank falling away so rapidly on either side, that it afforded scant footing for men in armour. Thus fourteen knights, and more especially such knights as these, were for the moment at no serious disadvantage. Their first furious onset not only cleared the causeway but left them free to retire at leisure to the shelter of the castle, where they found themselves still unscathed, while the ground without was strewn with the corpses of their foes.

This alternation of mutual advance and retreat was continued for sometime. If the Minamoto knights really

achieved that day a title of the deeds for which history gives them credit, the praise posterity has accorded them is still too feeble. We have seen at any rate of what things they were capable on less momentous occasions, and we can well believe that it must be indeed an ample chronicle which over-estimates the limit of this, their supreme effort.

There came a time, however, when of the whole fourteen, only two made good their retreat to the gates. These two were Benkei and Saburo. The latter was still comparatively unscathed, but the former, in addition to many minor hurts, had received a gash in the neck sufficient to have disabled many a stout man.

Leaving his comrade to guard the gate, the glavesman hurried off to warn those within that the fatal moment had at last come. Yoshitsune, dressed entirely in white, was reading the sacred canon in a distinct voice, while in the adjoining chamber, of which the doors were thrown open, his girl-wife sat, her head bowed on her bosom and her baby sleeping peacefully on her knees.

Benkei paused involuntarily on the threshold. The power of speech and action seemed to have completely deserted him, and it was not till Yoshitsune's quiet eyes had been fixed on his for some instants, that he was able to falter:—"They are all gone; the least men that ever wielded weapon. Saburo and I alone are left. He guards the portal and I have come to see your face once more in life."

"Then in truth, Benkei, if so many good men await us at the foot of the Happy Mountains it were ill done to linger long here. But a few moments more and we shall be in the presence of the Gods, who alone know how loyally you have served me and how much I have loved you. As for me, it grieves me little that I should cease to be the object of treachery and slander, nor is there any pain in death, since it leaves us undivided. Yet would I find time to read this canon to the end before I go. Strike home then once more, old friend and trusty comrade, for the noise of the battle sounds nearer, and, if my ear deceive me not, Saburo is in evil case even now."

The glavesman dropped upon his knees and saluting his chief for the last time, turned back to succour his companion. At first his feet faltered strangely and he groped his way like a blind man, but beyond the threshold his strength returned to him with redoubled vigour, for at that very instant he saw Saburo beaten to the ground by a rain of blows. He leaped out into the thick of the melody, and dealing such strokes that those who survived them fell back in very bewilderment at their might, raised his comrade's body and carried it within the gate; too late indeed to save his life, but not too late to know that Iné's name and his own were the last sounds Saburo's lips shaped.

It is related that for a long time after this Benkei single-handed held the gate against the whole of the enemy's force. He had broken the handle of his glaive short, so that he might use it more freely in his constrained position, and from above the pile of corpses that soon accumulated at his feet, the terrible weapon, whether by unerring aim or deadly sweep, bore down all that came within its range.

His body was covered with wounds and a dozen arrows had pierced the points of his armour, but to the end none could discover any diminution of his strength, so that his assailants began to ask one another whether they were pitted against a man or a god.

At last there came a lull in the combat. Barb and blade seemed powerless to overcome the giant, and his adversaries, ashamed of their discomfiture, were preparing a new method of assault. Four men armed with iron balls and chains to be thrown after the fashion of a lasso, advanced behind each other along the causeway. The first two were content to forfeit their lives in the attempt, but the others would scarcely fail to entangle the glavesman's limbs and so hamper him that he might no longer resist.

Benkei, meanwhile, appeared to take no notice whatever of this impending danger. Supported in part by the handle of his glaive, in part by the portal against which he leaned, he remained perfectly motionless, nor even changed his position when the leader of the four poised his weapon for a cast.

Defly thrown, the ball passed over his right shoulder, and whirling round and round, coiled its pendant chain

tightly about his arm. Then suddenly he lurched forward and fell heavily to the ground.

He had died where he stood, unconquered and unconquerable.

The assailants now surged pell-mell into the castle, from which the smoke and flame were issuing in dense volumes. They found Yoshitsune lying dead, his hands laid upon the corpses of his wife and child. A little more, and the fire would have achieved its purpose, for already the canon he had been reading was half consumed, and it was with no little pain that they succeeded in carrying out his body.

He was amply avenged. Yoritomo had desired his death but could not pardon his murderers. Six months later Oshiu was invaded by an overwhelming force under the command of men who had loved Yoshitsune too well to shew any mercy to his assassins. Yasuhira's head followed that of his victim to Kamakura, and the ample fief passed into the hands of strangers even as the old earl had prophesied.

*The End.*

## METEOROLOGICAL REPORT

FOR WEEK BEGINNING FRIDAY, APRIL 23RD, 1880.

Observatory of Daigaku, Moto-Fujicho, Hongō, Tokio, Japan.

## REMARKS.

Heavy line represents barometer.

Light continuous line—max. &amp; min. thermometers.

Dotted line—percentage of humidity.

Max. velocity of wind 31.5 miles per hour on Sunday, at 2 p.m.

The barometer is reduced to the freezing point and to the level of the sea.

The highest reading of the barometer for the week was 30.120 inches on Tuesday at 7 a.m., and the lowest was 29.430 on Saturday at 2 p.m. The low barometer of Saturday and Sunday was accompanied by a wind of greater than usual velocity. Two points of maximum temperature were reached during the week, on Saturday and on Wednesday, each being higher than any previous temperature for this year. The humidity was exceedingly low on Sunday, the percentage being '32, which cannot be shown within the limits of the chart. The total amount of rain for the week was '726 inches.

## SHIPPING INTELLIGENCE.

## INWARDS.

April 24, British corvette *Modeste*, Captain Mead, 1,934, from Kobe, 14 guns.  
 April 25 German schooner *Auguste Reimers*, Thompson, 207, from Takao, Sugar, to E. B. Watson.  
 April 28, Norwegian barque *Krik*, Larsen, 416, from Takao, Sugar, to Jardine, Matheson & Co.  
 April 28, Japanese steamer *Toku Maru*, Hogg, 1,012, from Kobe, Mails and General, to M. B. Co.  
 April 29, Japanese steamer *Hiroshima Maru*, Haswell, 1,200, from Shanghai and way ports, Mails and General, to M. B. Co.  
 April 29, German barque, *Hermann*, Haack, 389, from Takao, 9,500 piculs Sugar, to E. B. Watson.

## PASSENGERS.

Per British steamer *Malacca* from Hongkong:—From Southampton: Mrs. Rickett, four children, infant and amah. From Suez: Mr. L. C. Whitworth. From Hongkong: Messrs. Tye Heng and Suay Nam, and 12 Chinese in steerage.

Per Japanese steamer *Sumida Maru* from Hongkong via Kobe:—Mr. K. Fukuhashi (Japanese Consul to Amoy), Mrs. Fukuhashi

and two children, and Mr. Shugio; 1 European, 6 Japanese and 4 Chinese in steerage. From Kobe: Dr. Mailhet, Messrs. D. Reynolds, D. B. Taylor, L. L. Kobes, M. Pora, Nakayama, Ishimaru, and Nakazima; 141 Japanese in steerage.

April 25, Japanese steamer *Shimogawa Maru*, Frahm, 908, from Samusawa, Mails and General, to M. B. Co.

April 26, British steamer *Malacca*, Seaton, 1,709, from Hongkong, Mails and General, to P. & O. Co.

April 26, Japanese steamer *Shio Maru*, Kilgour, 824, from Kobe, Mails and General, to M. B. Co.

April 26, Japanese steamer *Sumida Maru*, Hubenet, 896, from Hongkong via Kobe, Mails and General, to M. B. Co.

April 26, German 3-masted schooner *Johann Heinrich*, Oestmann, 411, from Takao, Sugar, General, to Jardine, Matheson & Co.

April 27, British barque *Hachel*, Affleck, 282, from Takao, Sugar, and General, to Mitsui Bussan Kaisha.

April 27, Japanese steamer *Wakanura Maru*, Christensen, 1,343 from Kobe, General, to M. B. Co.

Per Japanese steamer *Hiroshima Maru*, from Shanghai & ports:—J. G. Kennedy Esq., (H. B. M.'s Chargé d'Affaires), Mrs. Kennedy, child and maid, Mr. and Mrs. Drew and two children, Mrs. Holmes and three children, Mrs. Dató and child, Messrs. T. Walsh, D. H. Bailey, W. Jackson, R. Ewing, H. F. Brown, W. E. Clark, Imai, Saiyeni, Kanbarra, Takatsukasa, Fukazawa, Nakai, Nijima, and Mutani in cabin; 3 Europeans, 2 Chinese and 205 Japanese in steerage. For San Francisco: Miss S. Trask, M.D., Paym, Littlefield, U.S.N.

## OUTWARDS.

April 23, French steamer *Volga*, Guirand, 1,502, for Hongkong, Mails and General, despatched by M. M. Co.

April 23, Japanese steamer *Genkai Maru*, Conner, 1,917, for Shanghai and ports, Mails and General, despatched by M. B. Co.

April 28, American ship *Columbia*, Fumell, 1,490, for Taiwanfoo.

April 28, H. B. M. S. *Seienger*, Lieut.-Com. O. P. Tudor, for Kobe.

April 30, American ship *Paul Revere*, Mullin, 1,782, for Guam, Ballast, despatched by Smith, Baker & Co.

May 1, Japanese steamer *Meiji Maru*, Peters, 1,010, for surveying, despatched by Lighthouse Department.

## PASSENGERS.

Per French steamer *Volga* for Hongkong:—Mrs. Fitzgerald, Messrs. Mouchet, C. Lévy, Sano Tannezané, Moiki Riochiro, Fujiyama Jochi, P. Lerme, and J. Regnault in the cabin, and four Chinese in the steerage.

Per Japanese steamer *Genkai Maru* for Shanghai and ports:—Mrs. Kubo and servant, Mrs. Shishido, Rev. L. H. Gulick, Messrs. A. von Knoblock, H. I. G. M's. Consul, E. C. Kirby, Hosokawa, Takagi, Uchiyama, Hayaishi, Hattori, Inouye Shoyo, Inouye, Ito, R. Smith, D. B. Taylor, and Nishiyama in cabin.

## CARGOES.

Per British steamer *Malacca*, from Hongkong:—

Sugar ... .. 5,391 pkgs.  
 Sundries ... .. 2,367 "

Per French steamer *Volga* for Hongkong:—

Silk for France ... .. 84 Balcs.

Per Japanese steamer *Genkai Maru*, for Shanghai and ports:—

Treasure ... .. \$10,400.00

Per Japanese steamer *Hiroshima Maru* from Shanghai & ports:—

Treasure ... .. \$10,000.00

" ... .. Yen 161,700.50

Per Norwegian barque *Krik* from Takao:—

Sugar ... .. 10,000 piculs.

## REPORTS.

The German schooner *Auguste Reimers* reports: Left Takao on the 10th April. On the 11th, on the east side of Formosa experienced a very strong S. E. gale with heavy rain and confused sea, which lasted for three days. From the north end of Formosa to Linahoten, strong northerly winds. From thence to Oshima, moderate S.E. with rain. On the 22nd April, off Oshima, experienced a severe S.E. gale with very high sea and heavy squalls which lasted only for 15 hours. From thence to port, west and northerly winds and fine weather.

The P. & O. Company's steamer *Malacca* reports: Left Hongkong on the 19th of April instant at 20 mins. past four o'clock in the afternoon. Experienced strong north-easterly winds, with overcast and cloudy weather to Turnabout. From Oshima, encountered a heavy north-westerly gale with hard squalls to Rock Island. Observed a current setting in a south-easterly direction from about twenty miles from Oshima to Rock Island. From Rock Island experienced strong, fresh winds to arrival in Yokohama at 15 mins. after twelve noon, on the 26th of April.

The Japanese steamer *Sumida Maru* reports: Left Hongkong on the 20th April. Had light N. E. winds which gradually increased; on the evening of the 21st it blew a heavy gale with high confused sea, wind veering from S. E. to S. W. the gale lasting until 6 a.m. on the 22nd, from which time to Kobe had fresh westerly winds with fine weather. Arrived in Kobe on the 25th inst. at 6 a.m. Left Kobe on the 25th at 2 a.m. Arrived in Yokohama on the 26th at 3 p.m.

The Norwegian barque *Krik* reports: First part of passage, strong N. E. winds; later part, variable winds and fine weather.

MATSUZAKA HOTEL,  
KIGA,  
(Hakone Hot Springs.)

Yokohama, July 19, 1879.

## W. & A. GILBEY'S WINES AND SPIRITS.

**W. & A. GILBEY** have special facilities for carrying  
on an extensive Foreign Trade, having held for  
many years in their Excise Bonded Stores, for the purpose  
of their Home Trade, a stock of not less than 12,000  
Casks of Wines and Spirits, which are equally  
available for Export. These stores are by far the largest  
private Duty Free Warehouses in the World, and are under  
the supervision of a staff of Excise Officers specially at-  
tached to these Warehouses.

THE EXTENT of W. & A. Gilbey's purchases enables them  
to give the best VALUE to the public, as a twentieth part of  
the Foreign Wines consumed in the United Kingdom is  
supplied from their stock. In the year 1876 W. & A.  
Gilbey paid duty on 1,881,049 gallons of Wines and Spirits,  
and the average quantity bottled and sent out by them  
daily was 3,050 dozens or 36,600 bottles.

QUALITY is guaranteed by W. & A. Gilbey, and is the same  
whether the Wines or Spirits are obtained direct from their  
Head Establishments or from any of their Agents. The  
purity and genuineness of every article in this list are  
guaranteed in accordance with Act of Parliament, 38 and  
39 Vict., Cap. 63.

W. & A. Gilbey have always adhered to the standard of  
Bottle Measure recently recognised by the Government,  
namely—

6 bottles contain one gallon; 12 half-bottles contain  
one gallon.

SECURITY is ensured to the purchaser, each bottle bearing  
W. & A. Gilbey's seal and label guaranteeing quality and  
measure, and the strength also in the case of Spirits.

EDWARD FISCHER & Co.,  
Agents for Japan.

## KEROSENE OIL.

**STORAGE and FIRE INSURANCE**

For terms, apply to

EDWARD FISCHER & CO.

Yokohama, 3rd March, 1880.

## THE GREATEST

## WONDER OF MODERN TIMES HOLLOWAY'S PILLS.

Persons suffering from weak or debilitated constitutions will dis-  
cover that by the use of this wonderful medicine there is "Health  
for all." The blood is the fountain of life, and its purity can be  
maintained by the use of these Pills.

SIR SAMUEL BAKER,  
in his work entitled "The Nile Tributaries in Abyssinia," says, "I  
ordered the dragoman Mahomet to inform the Fakel, who was a  
"Doctor, and that I had the best medicines at the service of the  
"sick, with advice gratis. In a short time I had many applicants,  
"to whom I served out a quantity of Holloway's Pills. These are  
"most useful to an explorer, as possessing unmistakable purgative  
"properties they create an undeniable effect upon the patient, which  
"satisfies him of their value."

## SIMPLE, SAFE AND CERTAIN! HOLLOWAY'S OINTMENT.

Is a certain remedy for bad legs, bad breasts, and ulcerations of all  
kinds. It acts miraculously in healing ulcerations, curing skin  
diseases, and in arresting and subduing all inflammations.

MR. J. T. COOPER,  
in his account of his extraordinary travels in China, published in  
1871, says—"I had with me a quantity of Holloway's Ointment. I  
"gave some to the people, and nothing could exceed their gratitude;  
"and, in consequence, milk, fowls, butter, and horse-feed poured  
"in upon us, until at last a tea-spoonful of Ointment was worth a  
"fowl and any quantity of peas, and the demand became so great  
"that I was obliged to lock up the small remaining stock"  
Sold by all Chemists and Medicine Vendors throughout the World

## LITERARY ACTIVITY IN JAPAN.

THE ardent literary tastes of the Japanese as a people, are well known, and frequently furnish matter for comment to foreign writers on the country. There is undoubtedly a wide-spread love of their old tales or *Mo-no-gatari*, as well as of works approaching more nearly to the dignity of history, such as the *Taiko-ki*,—or history of the doings of Taiko, in something over one hundred and twenty volumes,—among the lower classes. In order to meet this want, lending libraries, where such works can be obtained at a fraction of a cent per volume for several days, have been provided. These establishments are by no means modern in Japan, and although the changes of the last quarter of a century have directed thousands of inquiring minds into paths with which they have neither part nor lot; yet they are still very numerous. No town or large village is without one; and the messenger of the lending library with his books carefully arranged according to their sizes, and forming a pile which, when on his back, stretches high above his head, forms a figure of every pictorial street-scene of old Japan.

It is not of these, however, that we would speak in this article. We wish to refer to certain statistics of the *To-shokio-ku*, or bureau of the Department of the Interior, which deals with printed books, newspapers &c., and may therefore be relied on; but, like most Japanese statistics, they have been somewhat delayed, being for the eleventh year of Meiji (1878.) They are to be regarded, therefore, as applying to that year alone. From these official records it appears that there are in all two hundred and thirty-six newspapers in Japan, with a total annual circulation of 89,449,525. Under the head of "newspapers" is included all transitory literature, the transactions of any learned body, and magazines devoted to

military and naval topics being included. Of this number of journals, one hundred and twenty-eight are published in the capital, ten in Kinshiu and seven in Shikoku. The statistics for Kinshiu and Shikoku are added in order to show how far modern changes have reached these comparatively remote regions. The paper having the largest circulation is the *Yomiuri Shimbun*,—the "penny dreadful" of Tokio,—of which there is a yearly sale of 6,565,786, or of about 20,000 copies per day. The staple news of this little paper, which is sold for a cent per copy, consists of murders, breaches of the seventh commandment and the consequences, apparitions, and real or imaginary social and physical phenomena in general. Such tales of horror and bits of scandal are generally brief and to the point,—all the more piquant if a foreigner's name can be introduced,—ending with some short moral reflection calculated to excite shame in the bosom of the backslider. Another means of assisting greatly in carrying home the moral to the heart of the delinquent who has been guilty of this or that impropriety unpunishable by law, is the news vendor who sometimes succeeds in disposing of a whole bundle of copies to the unfortunate culprit, before the door of whose residence he proclaims in a loud voice the contents of the periodical, dwelling doubtless with much emphasis on that portion which may reasonably be supposed to have most interest for that particular neighbourhood.

Of the other leading papers the following was the circulation during the year:—

Tokio <i>Nichi Nichi Shimbun</i> .....	8,274,520.
" <i>Hochi Shimbun</i> .....	2,072,151.
" <i>Choya Shimbun</i> .....	2,077,639.
" <i>Akebono Shimbun</i> .....	2,329,417.
Osaka <i>Nippō</i> .....	2,298,907.
Yokohama <i>Mainichi Shimbun</i> .....	256,826.

The increase and decrease in sale as compared with the previous year were as follows:—

<i>Nichi Nichi Shimbun</i> ,	decrease...	10,718.
<i>Hochi</i>	"	821,298.
<i>Choya</i>	"	8,241,871.
<i>Akebono</i>	increase...	1,109,063.
Osaka <i>Nippō</i>	"	1,299,915.
Yokohama <i>Mainichi Shimbun</i> ,	"	69,988.

The reason of these figures is not far to seek. During 1877 the Satsuma rebellion was going on, and the *Choya Shimbun* was opposed, as publicly as it dared to be, to the Government. The suppression of the revolt took away its sting, and seems from these figures also to have taken away its circulation.

One curious item in the statistics shows that, of the total number of newspapers sold, amounting to over thirty-three millions, 89,517 were purchased by foreigners. Taking all the year round an average of 91,507 papers are sold daily, and, taking into consideration the population of the country, on the average every ten thousand persons purchase 26 newspapers. This is undoubtedly a small average as compared with England and America; but when we recollect the youth of the newspaper press in

Japan, and when it is remembered that in large tracts of the country a newspaper is still unknown, the average will seem a fairly high one.

During the year the publication of eighty newspapers ceased, of the proprietors' own accord; fifty-six in Kioto, four in Osaka, one in Kinshiu, and two in Shikoku; while sixty-six new papers were started, namely, twenty-five in Tokio, two in Kioto, ten in Osaka, five in Kiushiu and three in Shikoku, the balance being distributed through the main island and Yesso. Two papers were temporarily suspended by Government, namely, the *Choya Shinbun* and the *Shinji Shinbun*; while two, the *Ammin Zasshi* of Kioto and the *Kôzon Shimpô* of Osaka, were wholly suppressed.

Coming now to printed books, we find that 5,817 new works were published during the year. Of these 3,822 did not obtain or apply for copyright, while 1,495 possess it. The fees levied from these latter amounted to yen 3,380.92 $\frac{2}{3}$  sen, being an increase of yen 792.29 $\frac{1}{2}$  sen on the previous year. The number of works shows an increase of 1,329. The copyright fees are levied according to the price of each work, and are said to be three times the published price of a single copy. Of all the works published 232 were translations from foreign languages; 2,535 were miscellanies, composed of extracts from other works—a form of literary labour very common in Japan. There were, also, 986 republications of older works. Divided according to the subjects of which they treat, there were 440 works on education, 280 on the history of Japan and other countries; 313 dictionaries and encyclopedias; 178 books relating to political economy and the principles of government; 53 on agriculture; 61 on commerce and trade; 9 on various handicrafts; and 107 publications by various sects. This latter item may perhaps be styled theology; and it is stated that the publications of the various Christian Missions in Japan are included under this head. The number of volumes composing the 5,817 works above mentioned is 9,967, being an increase of 944 on the previous year. The almanacs of various kinds published is given at the enormous total of 2,957,174, or an almanac for about every eleven inhabitants of the empire. These almanacs are licensed by the Government.

On another occasion we may return to the subject of translations of foreign works into Japanese. At present it will be sufficient to point out that 232 translated works in one year shows a great demand for western knowledge among the people. Other changes beside this are coming over the face of Japanese literature. The old system of printing from wooden blocks, on doubled sheets of paper is fast going out, and moveable types, thick, white foreign paper, and binding in boards are usurping their place. All official reports, educational works, translations and almost all books on foreign learning are printed in the latter style; and, although they can hardly be said to be as beautiful, as a clearly printed book in the old style, they are far more compendious in form and size.

#### THE MIDDLE YANGTSE.

**F**LOWING from Tibet and Kokonor through all the central provinces of China, the noble stream the Yangtze, eastern rival of the Mississippi is well entitled to the affection in which it is held by the sons of Han. It has also been a favourite object of exploration and research by foreign travellers, one of whom, Captain Blakiston, has succeeded in identifying his name with its waters, which he divides into a lower and an upper stream; the former extending from the Tungting Lake to the mighty mouth of the river: the latter the watercourse from its sources to the lake. Dr. Macgowan,

a later traveller, to whose observations we have at late date made brief reference, thinks that it is preferable to consider the great artery as divisible from this latter point upward into a middle and upper portion, the division between these being where the river receives the waters of its chief affluent, the Min or Chintoo, whence the Upper Yangtze proper extends to its origin in the Taugla mountains of Tibet. At the annual meeting of the Shanghai branch of the Royal Asiatic Society Dr. Macgowan read a very able and interesting description of his travels over the central portion of the "Son of the seas."

Ichang, an inland port, situated eleven hundred miles from Shanghai, and the head of the steam navigation of the river, is the spot from which the journey into ultra-China commences. For there is a further China from which the hither portion of the empire is separated by mountain ranges one hundred miles wide, and with axes nearly uniformly lying at right angles to the course of the Yangtze, which however makes light of such obstacles and forces its torrential way through gorges which are often not wider than the entrance to the creek. Above Ichang is to be found river scenery of surpassing grandeur, and a voyage which should not be attempted by anyone not in good physical condition. "The great poet Su Tung-po says that 'ascending to Szechuen is as difficult as climbing the empyrean.' Inland people have less dread of making a sea-voyage than have the people of Hupeli and Szechuen of ascending or descending these dreadful rapids; they know but too well how hazardous the undertaking is. If the voyager is not himself wrecked he is bound to be a witness of wrecks." These disasters are in most part due to the breaking of tow-lines. Large boats, with many people and valuable cargo on board, are not infrequently engulfed from this cause. Occasionally, as in the case of a French missionary who was knocked overboard and drowned, the recoil of the tow-rope after snapping may be the cause of serious accident. Then there is the constant liability of touching ground and capsizing, an event which happened to the boat in which the Doctor was making the ascent. As he was writing in the "house" at the time of the occurrence his life was saved with extreme difficulty. Three of the people on board were drowned. In spite of the efficiency of the life-boat service, to which in a previous notice of Dr. Macgowan's book we alluded, the annual destruction of life in this much traversed passage must be enormous. There is already a movement on foot to establish a steam-ferry, which would be both safe and remunerative. The governor of Hunan owns a steamer which ploughs the Tungting lake; and the semi-official journal of the Shanghai Taotai has recently advocated the use of steam on all inland waters. At present the percentage of fatal accidents exceeds that which occurred from balloon ascents during the siege of Paris. The answer to the natural inquiry which suggests itself, why communication is not maintained between ultra-mountain China and Eastern China along the river banks is, that there are no banks, nor valleys, the only passage being that of the stream which rushes along between an almost uninterrupted series of perpendicular walls; and thus the many millions of the opulent inner region find the rapids of the Yangtze, if not their sole, at least their best, means of communication with the outer world. West, North, and South they are imprisoned by mountains and deserts among the greatest in the world. It is thought that steam communication aided by engineering would be quite practicable. Already much has been done by the Chinese to improve the navigation of the gorges, by the erection of terraces for the use of trackers, by perforating rocks for the boatmen's hawsers, hooks and poles, and in some cases by removing rocks altogether. Very minute sailing directions, in which all the dangers are carefully pointed out, have been

published. These widely separated districts of the Middle Kingdom might be connected by a railway; but this would have to be carried over precipitous mountain ranges, or make a costly and extended tour to the north, even then failing to meet all the exigencies of the case. The river must always remain the preferable and the least costly route; and the introduction of steam conveyance is of the first necessity. The still unratified Chefoo convention provides that, when steamers have succeeded in ascending to Chungking, further arrangements can be taken into consideration, that is for the opening of the upper portion of this king among streams to direct foreign commerce. "Why not then," asks our author "name the improvement of the Yangtze, the 'single concession' which commerce demands? The accomplishment of such an undertaking would be a boon to China and to the mercantile world at large; it would bless the bestower and the recipient. What Austria has undertaken to do for the 'Iron Gate' of the Danube, China might well undertake to do for her Iron Gate, a work confessedly of greater magnitude, but the bestowal of a liberal charter on a public company might perhaps render the task perfectly feasible." Still the difficulty in the way of the desirable consummation must not be underrated. And it may best be estimated by the amount of casualty sustained. The Life-Boat Association of Hankow alone in a period of seventeen years rescued 4,132 persons from drowning, and recovered the bodies of 6,955 drowned; in other words about eight and a-half persons are known to be submerged every week in the comparatively placid waters that lave Hankow, and as there is no flood tide to bring back the bodies of the drowned, it is presumable that the non-recovered drowned would greatly swell the number of fatal accidents.

The courtesy which is so often displayed by secluded populations to foreigners is well illustrated in remote Szechuen. "Ascending the Yangtze at the rate of less than a mile an hour, the traveller is enabled to see much of the people of the great province of Szechuen, whom all accounts concur in representing as most friendly to strangers. This is shown particularly when they think the foreigner is in danger of missing the right path—they will, unasked, leave their work to show him the way, conduct which is in striking contrast with that of the inhabitants at the east of the gorges." The Lake people it is said are, of all, the most inimical to foreign intercourse, while they furnish China with her best troops—with such men as Tso will be able to rely upon in any possible effort which he may make for the reoccupation of Ili or the defence of Chinese frontier in Central Asia.

In our earlier brief notice we mentioned the fertility of the province of ultra-China explored by Dr. Macgowan, and the fact that opium is grown and extensively smoked there. The paper before us contains other matter of considerable interest, and some good advice to foreigners in their attempts to establish intercourse with the natives, who apparently are not ill-disposed to receive strangers, but are disinclined to allow these to thrust themselves upon them unannounced and unbidden. A certain foreign missionary, whose presence at a town in the lake district was undesirable, was neither burned nor stoned nor incarcerated, but scavengers were engaged to fill his boat with ordure; and he found it impossible to remain in position after the discharge of the first few bucketfuls of refuse. The incident of a foreigner much teased by wondering country-people, who gained the admiration of the crowd by good-humouredly inflicting summary and fistic punishment upon the largest of his aggressors, is pleasantly related. With good humour, ordinary politeness and tact, strangers can travel in the interior of China with more immunity than a Chinaman would be likely to experience in Whitechapel or the manufacturing districts of Staffordshire or Lancashire.

We have not space to notice Dr. Macgowan's reference to the Lolo mountaineers and the vestiges which he found of the visits of foreigners who had preceded him in or near the localities which he visited, or even to reproduce his description of the manifestation of the Glory of Buddha, one of those atmospheric illusionary pageants which the majestic effects of helioscopic refraction produces in all highly mountainous regions. The voyager's experience, however interesting it may be in all its minutiae, is principally valuable in adding to proofs already existing that there are yet vast districts, populous and possessed of great natural wealth, which, as soon as they are made fairly accessible, will afford large outlets for the productions of western invention and industry.

#### EDISON'S FRESH DEPARTURE.

EVER since the earliest times of which we have any authentic record the lust for gold has been a ruling passion among the human race. The *auri sacra fames* glows with as fierce intensity in the breast of the Californian or Australian miner of the present day, as it did when Cortes and his companions fought their desperate way along the causeways of Mexico to the penetralia of Moctezuma, or when the steel-clad warriors of Pizarro marched to the plunder of the golden-roofed shrines of the Children of the Sun.

Anything that appeals to this predominant failing is secure of a ready response; and therefore we feel little surprise that the ring of speculators who make Mr. Edison (the Magician of Menlo Park) their central figure, or it may be stalking-horse, should have now turned their attention to the gold-mining industries of America as a medium for fresh "inventions" and a new field for plunder. It has been evident for some time past that the Menlo Park association would have to do something or other to keep up the value of the Edison stock. The electric lamp had proved such a conspicuous failure, that any further raids on gas shares through the instrumentality of bogus discoveries were rendered impossible. Some other delusion had to be fostered, and we must certainly pay a well-merited tribute of admiration to the ingenuity and astuteness which chose the reduction of "tailings" as a suitable subject with which to excite the interest, and take the money, of the large section of mankind which may be ticketed "credulous and gullible."

As the appellation "tailings" probably conveys no meaning to many, we will here give a brief explanation of the word in its present connection. In gold-mining, huge quantities of alluvium and quartz crushed to powder, are continually accumulated after being passed through the various apparatus used to extract the gold, which the alluvium, gravel or quartz, contained in its natural state. This refuse of gold-mining is technically known as "tailings," and it is to these "tailings" that Mr. Edison is now directing his attention with a view to extract any gold that may have escaped from the quicksilver wells, buddles, amalgamators, and numberless appliances, the outcome of the experience of nearly half a century, aided by unlimited capital and all the resources of scientific research.

It is no doubt true that laboratory experiments frequently show that some gold is present in "tailings;" but every attempt to deal with these heaps of refuse in quantity and remuneratively has, as may readily be supposed, hitherto proved utterly unsuccessful. Now, however, it is put forward that Mr. Edison has solved the difficulty; and that he has succeeded in much the same way and to the same extent that he solved the problem of the electric light, we have, at present, very little doubt.

The mode adopted to bring before the public Mr. Edison's new discovery bears a very suspicious family resemblance to

the means employed in the electric light business. Of course the "interviewer" is a prominent feature in the transaction; and, accordingly, we find the *New York Herald* announcing, in sensational language, "how Edison, searching for platinum in old tailings, found gold in immense quantities." A lengthy account of the great invention is then given. We are informed that "the discovery was made while working over these tailings in the search for platinum, which Edison needed for the construction of his electric lamps;" and then precise mention is made of the travels of Mr. Edison's emissary during several months stay in California, procuring, and forwarding to Menlo Park, samples of tailings from different localities in that State. "At French Creek he (the emissary) received a letter from Mr. Edison informing him that some of the later tailings which he had forwarded were very rich in gold as well as containing considerable platinum." From this it may be inferred that the present scheme did not leap fully matured from Mr. Edison's brain, like Minerva from the head of Jupiter, but rather that some glimmering idea of what might be speculatively done presented itself about this time to his imagination or to that of his colleagues. In the absence of more definite information we should be inclined to fix the date of the new discovery at the time of the French Creek letter, and coincident probably with the collapse of the electric lamps. As time went on the agent received instructions to enter into contracts for the purchase of all the tailings obtainable. "From this time forward advices from Menlo Park referred but passingly to platinum. The magic word 'gold' was now the absorbing theme; and it became apparent to the platinum hunter that his chief had taken a new departure," or, as we prefer to describe it in less enthusiastic language, the lamp bubble had burst and it had become necessary to blow a bubble of a new kind in order to keep the stock of the company at a satisfactory quotation.

It is then stated that "a history of the experiments that Edison tried before he alighted on the Eureka discovery would fill a volume," from which it would appear that the reporters were incorrect in their former, ornate descriptions of the undivided and absorbing attention which Mr. Edison devoted to the electric light, unless indeed he possesses the distinguishing attribute of Sir Boyle Roche's memorable bird. We are also seriously informed that the "magician" was greatly annoyed at finding gold in the "tailings instead of the platinum he sought." What follows is too good not to be extracted in its entirety:—"Again and again, after subjecting a quantity of tailings to his process, and finding, as a result, not a residue of platinum, but a little heap of gold, he would disdainfully throw away the shining particles. One day, however, it occurred to him that perhaps it would be as well, as a diversion, to pay more attention to the gold, and see what he could do in that direction." [We sincerely trust the 'diversion' will not prove as ruinous to many as the electric lamp has.] "With that in view, he renewed his experimenting. The results were astonishing. Tailings that under the microscope revealed scarcely a trace of the precious metal, and from which panning with mercury none were obtained, were found to be quite rich in it. Platinum now grew to be a thing of but little concern. The enthusiasm that, time and again, in all ages and in all countries, has invaded the sanctum of the scientist and alchemist in the search for that which moves the world, took possession of Edison. He saw before his eyes a wonderful discovery. It seemed hardly possible that he had succeeded." Is Mr. Edison hoaxing the reporter or is the reporter hoaxing the public? Tailings that, under the microscope, which magnifies to thirty thousand diameters if worthy of the name of microscope, shew scarcely a trace of gold, are found to be quite rich in the precious metal! We are sorry to cast a doubt upon so well imagined a tale, but we really might have been spared the attempt to impose this tax upon credulity.

The great "Eureka discovery" having been made, the next question was how to turn it to practical account. It might have been thought that, as the invention supplied "a cheap and simple method of working the tailings,"—and these are not only valueless, but a positive annoyance and source of expense to legitimate miners,—Mr. Edison and one or two of his friends would have utilized the discovery for their own exclusive benefit. But no, Mr. Edison is removed far above such sordid considerations; and, accordingly, we find that:—"The Edison Ore Milling Company was formed. . . . The inventor took a seat in the Board of Directors. Contracts were soon made by which were secured millions of tons of tailings. All the tailings of the Spring Valley Hydraulic Mining Company, which are washed down at the rate of fifteen thousand tons a day, and cover a tract of several square miles, were secured for a term of years. The Powers Oroville Mining Company, on the Feather River, was contracted with for their tailings, which cover a large tract. Contracts were also made for the tailings of the Myocene Mining Company and other large hydraulic mines in the vicinity of Oroville." It is very evident from this that there need be no apprehension in the minds of the lucky shareholders in the Edison Ore Milling Company that their operations will come to a premature close through a deficiency in the supply of tailings. In fact, we should have thought the fifteen thousand tons a day, all abounding in gold, of the Spring Valley Company, sufficient to satisfy the most avaricious; but it seems that the Edison Company do not share the generous instincts of the magician; he benevolently allowed them to participate in the benefits of his discovery, they wish to monopolize all the tailings in California. But some consolation remains, shares in the company may perhaps be procurable—at a price.

Continuing to peruse the account in the *Herald* we reach two anecdotes relative to the new invention. We read:—"After the contract with the Powers Company had been concluded, it is related that when Mr. Powers, better known in his section of California as Jackson County Powers, an old forty-niner, came to Menlo Park to satisfy himself regarding Edison's assertions as to the richness of hydraulic tailings from his mine, he brought some which had been twice worked, and knowingly imparted the fact to a few friends that Edison couldn't fool him. He would like to see Edison or any one else get very much gold out of these bags. He handed the sand to the inventor personally. Edison, before his eyes, went through the process, and in fifteen minutes handed him, as the result, a dollar's worth of gold. The Californian left the laboratory with eyebrows elevated. Another sceptic became convinced when gold obtained from a small heap of tailings was presented to him in the shape of a strip seven inches long, one wide, and of the thickness of an ordinary business card." It would be interesting to know if these tailings were also "examined with a microscope and shewed no trace of gold" because it seems remarkable that so large a quantity of the precious metal could be in "a small heap of tailings" and yet not be readily detected by the naked eye. Surely the mysteries of "salting" cannot have penetrated the scientific precincts of Menlo Park?

Having gradually led up to the chief point of interest, the *Herald* reporter at last kindly introduces us to the magician. We are informed that, "with a view to obtain from the scientist himself authoritative statements in regard to this discovery, a *Herald* reporter visited Menlo Park. He found the great inventor in his chemical laboratory—in the midst of his labours"—and the following conversation ensued:—

"So you have branched off into the mining business, Mr. Edison?" began the reporter.

"Well, you can hardly call it mining," answered the man of science, as he pushed aside a bag of tailings, which he had

been handling. 'It is the milling of ores, and quite distinct from mining. My business is experimenting. Without experimenting I am nothing. The devising of economical milling processes, for working low-grade ores requires oceans of experiments. In fact, the work is a paradise of puzzles.'

'Would you state generally the character of your process? Do you use stamps, or simply treat the tailings with chemicals?'

'We are going to mill, but still it can hardly be called a milling process, although the material passes through a mill.'

'Are there not other processes which, it is claimed, will get out the waste gold?'

'Plenty of them,' replied the inventor. 'The country has been overrun with process men until if you say 'process' to a Californian you are likely to be pursued with a shotgun.'

This sounds ominous, actually talking of possible danger from shotguns at this early stage of the proceedings, but it may be prophetic. At some future time, when the ore-milling project has followed the electric lamp into the limbo of Mr. Edison's failures and he perhaps contemplates a trip to California, his recent light conversation with the *Herald* reporter may recur to him fraught with warning to abstain from needlessly rushing into peril.

Then the journalist and the scientist go into figures.

"By your treatment what is the cost of extracting the gold?"

"Not more than \$5 per ton."

"What is the highest amount per ton you have succeeded in obtaining?"

"From the Powers claim tailings, which I found unusually rich, I got at the rate of \$1,400 to the ton. Why," continued Mr. Edison, growing enthusiastic, "there are \$50,000,000 at least in the tailings around Oroville, which I have already secured to be worked by my method."

Is it necessary to add anything further respecting an undertaking so palpably ridiculous? If Mr. Edison's invention is not more reliable than his facts and figures are, as retailed by the reporter of the *Herald*, it must be evident to the meanest capacity that a more bare-faced attempt was never made to extract gold, not from tailings, but from the pockets of credulous humanity, than the newly announced ore-milling company of the "Magician of Menlo Park."

**DURING** the past year a noticeable series of letters has appeared from time to time in a leading German paper—the *Allgemeine Zeitung* of Augsburg. They are entitled *Briefe aus Japan*, or "Letters from Japan," and are dated from Tokio. The writer does not seem to be tied down to time like ordinary newspaper correspondents; and can, therefore, carefully collect and collate facts and opinions before writing on any topic. At the same time nothing of any interest passes in Japan, without adequate treatment from his pen. All questions involving controversy are handled in a judicious and moderate manner; and although the writer cannot conceal his warm sympathy with the Japanese rulers and people, this is exhibited in a manner that can give no offence to others. These letters have now reached their tenth number, and a brief account of the contents of some of the more recent will show that, on the whole, they are among the most valuable contributions to a correct appreciation of the Japan of to-day that have recently appeared in the Europe. During November and December, this correspondent dwells at considerable length on the receptions accorded by the Japanese to their distinguished visitors, Prince Heinrich, General Grant, and Governor Hennessy. He animadverts on the persistent attacks and misrepresentations to which the latter was subject during his visit, but adds that he is a man of broad culture and experience, who can easily console himself under such circumstances. The Loochooan difficulty is discussed in more than one letter in its various aspects and possibilities. Respecting the *Hesperia* affair, of which a plain, unvarnished account is given, the writer points out the nature

of the outrage on the dignity and public spirit of the Japanese nation, and adds that it can in no way increase German prestige or the credit of the German name in the Far East. Education, the silver yen, and foreign trade are all treated at length, with statistics. The last two letters have arrived by recent mails. In the earliest we have a very prettily written description of Japanese new-year customs and festivities, which will doubtless attract much interest in Europe. In connection with the great fire of the close of last year, the subject of fire insurance is discussed. We notice here, with some surprise, the absence of any reference to Mr. Mayet, and his known monograph on this subject. Whatever may be thought of his proposals, whether we believe them to be practicable or otherwise—there can be no question that he was the first, by great labour and ability, to draw wide and general attention from both Japanese and foreigners to the possibility of a system of general insurance being carried out in Japan. In the portion devoted to the discussion of Treaty Revision, the information is now old to residents here. The tenth and latest letter is almost wholly devoted to an account of the military power of Japan, and it is possible that we may return to this portion of the correspondence. We have here given a very brief account of these letters; but, without translating a large part of them, it would be difficult to convey an adequate conception of the great amount of information conveyed therein to the public of Europe. It is only fair to state that they are not written for the information of residents in the Far East, but are intended to impart to the German public an exact idea of the progress of events in Japan at the present time.

**IT** is to be hoped that the *Ticonderoga's* mission to Corea will be attended with a satisfactory issue, and that the last of the isolated countries of the remote Orient will be opened to intercourse with western nations; but we must confess to very great doubts as to such a result being obtained by Commodore Shufeldt. In the first place he must be prepared to encounter hostile feeling, not only against foreigners in general, but against citizens of the United States in particular. The Korean rulers will not have forgotten the punishment administered by Admiral Rodgers in 1866; and the force at the Commodore's disposal is too small, to support, in Bowring's phraseology, the artillery of argument by the argument of artillery. It will not be in his power to pursue the same course as Perry did in Japan, as moreover men-of-war have become comparatively familiar objects in Korean waters since the treaty with Japan; so that such fear as they inspired a quarter of a century ago in the minds of the Japanese will hardly be of assistance in the present negotiation. Doubtless, the Chinese and Japanese Governments have been approached on the subject, and their good offices requested; and on the attitude which they will assume much must depend. If both or either were actively inimical to the conclusion of a treaty between Corea and a foreign power, negotiations for that purpose would be fruitless. It is probable that the rulers of Japan are favourable to Commodore Shufeldt's mission, but nothing is certainly known on this subject. If he should succeed without any resort to force, his success would be a matter for congratulation to all foreign nations, for it is much to be desired that some of the early episodes of British intercourse with Japan should not be repeated with her neighbour.

**I**N his report upon postal affairs in the colony of Hongkong for the year 1879, Mr. Lister, Postmaster General, makes special reference to the withdrawal of the English service from this country. He says that it was a measure which his department "never deprecated before its comple-

tion, nor has regretted since. Had the Japanese continued as indifferent to postal matters as the Chinese are still, it would have been desirable to maintain foreign Post Offices in Japan, but it is certainly the more healthy and natural state of affairs for the Post Office of any country to belong to that country. With the awakening interest and progress of the Japanese in postal matters complications of all kinds began to be created, and it was a relief to every one concerned when such perplexing questions ceased to exist. Far from being below the average standard of efficiency, it would be difficult to name any offices where the work is better done than at those of Japan with which this Department has the pleasure of exchanging mails, for it is a pleasure to coöperate with an administration at once courteous, intelligent, and exact. Mr. Machado, our late Postmaster at Yokohama, who has just become a naturalised British subject, has been transferred to Shanghai, where no doubt his services will be as acceptable to the community as they were to that at his former post. Among other postal improvements gained by the colony during the year were a reduction of international postage, the establishment of a uniform tariff, the reduction of the registration fee, and the establishment of a money order system with most of the Australian colonies.

**P**UBLICATION of Professor Ewing's interesting lecture on sanitary reform in Japan, delivered to the students of the Tokio University, is unavoidably deferred until next week.

#### AN ANCIENT BURIAL CUSTOM.

**H**ASTY visitors to Japanese museums may easily pass unnoticed certain hollow, red, earthenware images, generally about two feet in height, representing the human figure, or occasionally the head and shoulders of a horse. They are, nevertheless, worthy of careful attention, for simple, even ludicrous, as they appear, they yet carry us back to the times when one of the most savage and gloomy rites that it has ever entered the heart of man to celebrate was practised in Japan. In the present article it is our intention to glance at the custom as it was employed in this country, and then to show how wide-spread it has been both in ancient and modern times among savage or semi-civilised races. In all cases the pursuit of a peculiar custom from country to country, from the arctic regions to the torrid zone, through various islands and continents,—is an interesting occupation, but it is especially so when the custom is of the peculiar and appalling kind about to be here described.

In Japan<sup>1</sup> in ancient times, when a high personage died, it was usual to bury around the tumulus or cairn in which the body was deposited the male and female servants of the deceased. They were interred only as far as the neck, and were then left to die of starvation. This custom continued up to about the Christian era, when the reigning Emperor—so the story goes in the *Nihonki*—who heard the shrieks of agony of some victims who had just been buried in this manner, called together his ministers to get their advice respecting the abolition of the custom, notwithstanding its high antiquity; for, as he observed, it was a cruel recompense for faithful service to finally torture the servants to death. One of the councillors proposed the use of images made of clay instead of human beings, and the idea was immediately seized, and in course of time became universally adopted. Mr. Siebold, our best authority on these questions, dates the employment of these *tsuchi-ningio* or *tate-mono* as during the first six centuries of the Christian era. In China, also, it is said that the practice of sacrificing human beings prevailed, but now paper figures are used to represent the victims. The custom of sacrificing inanimate representations of animate objects, does not, however, seem to be very common. Sir John Lubbock, quoting Dubois' description of India, mentions that "various nations in

India, besides the Khonds, used to offer human sacrifices on extraordinary occasions; and even now in some places, though the actual sacrifice is no longer permitted, they make human figures of flour, paste, or clay, and then cut off the heads in honour of their gods;" but we have only a few further references to a merciful custom of this kind. It is very probable, however, that increasing civilization and humanity, rather than the arbitrary will of an individual monarch, were the causes of the abolition of the practice in Japan. But, as recently as the beginning of the 17th century, we find Iyeyasu, in his well-known "Legacy," chapter 75, writing as follows:—

"Although it is undoubtedly an ancient custom for a vassal to follow his lord in death, there is not the slightest reason in the practice. Confucius has ridiculed the making of J's. These practices are strictly forbidden, more especially to primary retainers, and also to secondary retainers, even to the lowest. He is the opposite of a faithful servant who disregards this prohibition. His posterity shall be impoverished by the confiscation of his property, as a mirror for those who disobey the laws."

Dixon in his work on Japan (p. 262) translates the same passage as follows:—

"When a master dies, his servants think it their duty to commit suicide. This is an old custom, but it is quite unreasonable, and nothing can justify a man in so acting. Sometimes, instead of committing suicide, there is a custom of putting into the grave figures representing servants. This is more unreasonable than the other. Such persons are not upright, and those who in future do these things must be severely punished."

The *Yo* above mentioned is said to refer to the figures of paper used by Chinese at their burial coronations. The *Kojiki* also contains a reference to the practice; in volume II. page 16 verso, in a sort of note, it says that in the reign of Mi Maki Iri Biko Iri Yo no Mikoto, otherwise known as Sujin Tennō, B. C. 97-29, a human hedge or hedge of men (*hitogaki*) was first put up at the Imperial tumuli (御陵). We have not been able to refer to Motoori's *Kojikiden*, to ascertain whether he enlarges on the subject.

So far Japan. The underlying idea in this and similar customs seems to be that death is not annihilation, but a continuation of existence, and that what the deceased has prized or used in life should be despatched with him to the realms which he enters after death; and this notion, though carried into practice in different ways in various countries, seems to have been almost universal. We find the practice referred to in Homer. In the 23rd Book of the *Iliad*, which describes the obsequies ordered by Achilles for Patroclus, the following lines occur in Pope's translation:—

While those deputed to inter the slain,  
Heap with a rising pyramid the plain;  
A hundred foot in length, a hundred wide,  
The growing structure spreads on every side;  
High on the top the manly corpse they lay,  
And well-fed sheep and sable oxen slay:  
Achilles covered with their fat the dead,  
And the piled victims round the body spread;  
Then jars of honey and of fragrant oil  
Suspend around, low-bending o'er the pile.  
Four sprightly coursers, with a deadly groan,  
Pour forth their lives, and on the pyre are thrown,  
Of nine large dogs, domestic at this board,  
Fall two, selected to attend their lord.  
Then last of all, and horrible to tell,  
Sad sacrifice! twelve Trojan captives fell:  
On these the rage of fire victorious preys,  
Involves, and joins them in one common blaze.

Herodotus mentions that amongst the Scythians, when a chief dies, they bury one of his concubines, his cup-bearer, a cook, a groom, a page, a courier and horses, and firstlings of everything else, as well as vessels of gold in the same grave with him. At the expiration of a year they kill fifty of the remaining servants, and fifty horses; they then place the latter upright around the grave, and putting the slain servants one on each horse, they leave them there. Similar customs existed among the ancient Germans and Scandinavians. With the latter, when a hero or chief fell in battle, "his arms, his gold and silver, his war-horse, and whatever else he held most dear, were placed with him on the pile. They did in reality firmly believe, and Odin himself had assured them, that whatever was buried or consumed with the dead accompanied him to his palace."<sup>2</sup> The rose Edda mentions that at the obsequies of Baldur, the body of his wife was burnt on the same pile with her hus-

<sup>1</sup> For the greater part of the information respecting this hideous custom in Japan, we are indebted to Mr. Von Siebold's beautiful and instructive work on Japanese archaeology.

<sup>2</sup> The *Legacy* of Iyeyasu, p. 27, translated by J. F. Lowder, Esq. (A valuable and interesting little pamphlet, which has now become so scarce that another edition might well be published.)

<sup>3</sup> Mallet's *Northern Antiquities*, Chapter X.

band's. Odin also laid a gold ring on the pyre, and Balder's horse, fully caparisoned, was consumed with the corpse of its master. Matthew Arnold, in his poem "Balder Dead" has cast a picturesque halo around this myth. Doubtless also the beautiful legend of the "Flower of Kings," bereft of all his knights but one, dying, and ordering his only companion to cast his sword into the waters of the lake, which he himself was shortly to traverse into eternity, and into the realms of poetry and romance, owes its origin to this custom.

But among no nations, either in ancient or modern times, were these rites carried out in such an extensive and blood-thirsty manner as among the early semi-civilized tribes of the American continents, the Incas and the Aztecs. Perfect holocausts of victims were sometimes sacrificed at the funeral ceremonies of kings and great nobles. Prescott tells us that on the decease of an Inca, his palaces were abandoned; all his treasures, except what were employed in his obsequies, his furniture and apparel were suffered to remain as he left them, and his mansions (save one) were closed up for ever. His plate and jewels were buried with him, and a number of his attendants and favourite concubines, amounting sometimes, it is said, to a thousand, were immolated on his tomb.<sup>4</sup> Among the Aztecs, also, a throng of slaves was sacrificed at the obsequies of a rich man.<sup>5</sup> The Nahuans, a Mexican race, placed various insignia, jewels, weapons, food and other tributes on the funeral pyre. The sacrifice of those doomed to follow the deceased, and minister to his wants in the other world, then commenced. These victims sometimes numbered several hundreds; they were consigned to the priests, who laid them on a kind of altar, cut open their breasts with a sharp knife made of obsidian, tore out their hearts; and threw them on the pyre, while the bodies were cast on another blazing hearth near by.<sup>6</sup> The practice of burying the victims alive, as in Japan, is ascribed to another of those ancient Mexican races; but it is added they were first secretly intoxicated and then mercifully clubbed to death. In another Mexican nation, those doomed to follow the dead prince were selected by his successor—an easy method by which the latter could get rid of individuals distasteful to him. Seven of those selected were noble ladies, to whom various duties were assigned. Among the male victims, all trades and professions—even clowns—were represented, and it was usual to add a few of the physicians who had failed to save the life of the monarch.<sup>7</sup>

In Marco Polo's travels we find several references to the custom. In the Tangut country, he says, they set wine, meat and other eatables before the body; "and this they do with the assurance that the defunct will be received with the like attentions in the other world. When the body reaches the burning-place the kinsfolk are prepared with figures cut out of parchment and paper in the shape of men and horses and camels, and also with round pieces of paper like gold coins, and all these they burn along with the corpse. For they say that, in the other world, the defunct will be provided with slaves and cattle and money, just in proportion to the amount of such pieces of paper that have been burnt along with him."<sup>8</sup> In a note to this passage the commentator adds:—"There can be little doubt that these latter customs are symbols of the ancient sacrifices of human beings and valuable property on such occasions; so Manetho states that the Egyptians in days of yore used human sacrifices, but a certain king Amosis abolished them and substituted images of wax. Even when the present Manchu dynasty first occupied the throne of China, they still retained the practice of human sacrifice." In this connection, however, it is right to refer to the statement of Dr. Wella Williams,<sup>9</sup> that no record of the sacrificial immolation of man by his fellow has been found in Chinese annals, in such a shape as to carry conviction to the mind that it formed part of the religious belief or ceremonial ordinances of the Chinese, although he allows that such sacrifices may have been made before the time of Confucius, and occasionally since. In mentioning the Tartars, Marco

Polo has the following passage: "Let me tell you a strange thing too. When they are carrying the body of any Emperor to be buried with the others, the convoy that goes with the body doth put to the sword all whom they fall in with on the road, saying 'Go and wait upon your Lord in the other world!' For they do sooth believe that all such as they slay in this manner do go to serve their Lord in the other world. They do in the same way too with horses; for when the Emperor dies they kill all his best horses, in order that he may have the use of them in the other world, as they believe. And I tell you, as a certain truth, that when Mongon Kaan died, more than twenty thousand persons, who chanced to meet the body on its way, were slain in the manner I have told."<sup>10</sup> On this Colonel Yule observes that "Rashiduddin relates that the escort in carrying Chinghis to his burial, slew all whom they met, and that forty noble and beautiful girls were despatched to serve him in the other world. As Mangku Kaan died in the heart of China, any attempt to carry out the barbarous rite in his case would involve great slaughter." Again in the city of Kinsay, which has been identified with the present Hangchow, the traveller relates that the bodies of the dead are burned. "And when the relations come to the place of burning, they take representations of things cut out of parchment, such as caparisoned horses, male and female slaves, camels, armour, suits of cloth of gold, (and money), in great quantities, and these things they put on the fire along with the corpse, so that they are all burnt with it. And they tell you that the dead man shall have all these slaves and animals of which the effigies are burnt, alive in flesh and blood, and the money in gold, at his disposal in the next world."<sup>11</sup>

When we come down to modern times, and examine the first volume, entitled "Wild Tribes,"—of Bancroft's great work on the Native Races of the Pacific States, we find that, from the Esquimaux in the frozen north to the Guatemalans and Yucatanese under the torrid zone, the custom of burying valuables, or implements that are supposed to be required by the deceased in the kingdom of the dead is universal, and that in most cases at the obsequies of a chief or rich man one or more slaves are frequently sacrificed. This latter rite is gone through by the Kadiaks, within the arctic circle, by the Aleuts, by certain tribes in British Columbia, by the Shoshones of Central California, and by the Mexican tribes on the Colorado. For sake of convenience the references in Bancroft to these burial customs are appended.<sup>12</sup> Among the Fijians, "When a chief died it was usual to 'sow with him' some of his women, and some slaves." With the Maories of New Zealand, "some of the objects used by the dead during his last illness were over employed again; they were generally broken or buried with the deceased." The Patagonians kill the horses of the dead, that he may have wherewithal to convey him on his journey; his arms are buried with him, and round the grave are ranged several dead horses, raised on their feet, and supported by sticks.<sup>13</sup> Williams, in his work on Fiji and the Fijians<sup>14</sup> describes a scene in which a chief was buried alive, and his wife at the same time strangled. The practice of Suttee or the burning of a wife with her deceased husband, in India, is familiar to all. It is stated that this custom was based on a mistaken interpretation of some of the Vedic hymns, which, however, according to Professor Monier Williams,<sup>15</sup> "will not be found to support any of those objectionable practices, superstitions, and opinions of the present day for which they were once, through ignorance of their contents, supposed to be an authority. . . . Nor do they afford any sanction to the prohibition of widow-marrriages." The custom flourished for centuries, and it is only in recent years, that, notwithstanding the teachings of Brahman reformers such as Rammohun Roy and Keshub Chunder Sen, and owing to the strenuous efforts of the British, it is dying out. The practice of killing a cow and burning it with the body of a deceased person, is mentioned as frequent in India; but we cannot say whether this is similar to the custom we are

examining, or whether it owes its existence to some Brahminical rite.

The absence or difficulty of obtaining works of reference on this subject in Japan, renders it impossible to follow this burial custom among the numerous tribes of Africa, Australia, the islands of the South Pacific and the Philippine archipelago; but enough has been said to shew that the hideous old world practice of Japan prevailed, widely; and that the humane device of the Japanese for avoiding its appalling cruelty, has, in other shapes, been adopted elsewhere.

## The Japan Weekly Mail.

'FAIS CE QUE DOIS; ADVIENNE QUE POURRA.'

### NOTICE TO CORRESPONDENTS.

No notice will be taken of anonymous correspondence. Whatever is intended for insertion in the JAPAN WEEKLY MAIL, must be authenticated by the name and address of the writer, not for publication but as a guarantee of good faith.

It is particularly requested that all letters on business, relating to Advertisements, Job-printing, or Accounts, be addressed to the MANAGER.

And that literary contributions of every description be addressed to the EDITOR.

YOKOHAMA: SATURDAY, MAY 8TH, 1880.

JAPANESE ERA 2540, MEIJI 13TH YEAR, 4TH MONTH, 8TH DAY,  
DO-YO-NI.

### NOTES OF THE WEEK.

On Sunday last the O. & O. steamer *Belgie*, from San Francisco, came into port, and was followed on the same day by the M. M. steamer *Tanais*, from Hongkong. The P. M. steamer *City of Tokio* arrived yesterday afternoon, and is circulated to leave for San Francisco on Thursday morning next, at daylight. The home mail went forward by the P. & O. steamer *Malacca*, on the 6th instant.

The Pacific Mail Company's steamer *City of Peking* was advertised to leave San Francisco for this port on Saturday last, the 1st of May. The vessel may therefore be expected to arrive here about the 21st instant.

The Ocean Steamship Company's steamer *Patroclus* left Singapore for Hongkong on the 22nd of April.

The Japanese man-of-war *Hei-ri Kan* arrived in Hongkong on the 23rd ultimo.

The *Meiji Maru* has returned to port owing, we are informed, to having touched on a rock.

The *City of Tokio* arrived last evening with the London mail of the 26th of March. The mail by the *Belgie* anticipated the European news.

After the arrival of the *Belgie* at San Francisco on her last trip, the Custom House officers seized 106 chests of tea which were consigned to Chinese firms, and it is said that a large quantity of tobacco and boxes of silk goods was found secreted in the tea. On the chests being examined in the Appraisers' Department, tobacco and silks of the value of \$2,500 were found concealed in the tea. The entire weight of the packages containing these smuggled goods was about 4,600 pounds, or more than two tons.

While on her last voyage from Takao, the German schooner *Johann Heinrich* met with very heavy weather. One night while lying-to under the lower topsails she came into collision with what was supposed by those on board to be a portion of a wrecked vessel. Immediately the schooner leaked considerably, and it was then discovered that one of the scuppers had been started. On the damage being made good, the leak ceased. Off Cape Iwasaki the *Johann Heinrich* passed a number of wrecked junks.

The outgoing American mail steamer carries away from Japan Mr. E. T. Sheppard, Assistant Adviser on International Law to the Department of Foreign Affairs, after a service of three years in this country. The term "Assistant" has been, during the greater portion of his stay in this country a misplaced one, since, until comparatively recently, there was no adviser.

During his period of office many important and delicate questions such as the quarantine regulations and treaty revision, have arisen for his consideration and advice. His work on extra-territoriality, published first in these columns and afterwards in pamphlet form, is a full and lucid discussion of this vexed question. We hope that Mr. Sheppard, on his return to America, will publish an enlarged edition of the monograph, as it deals with a subject of great interest, not only to lawyers, but also to all residents in countries where the extra-territorial system exists. Mr. Sheppard now resigns his position on account of ill health, chiefly induced, we believe, by injury received some years ago in a railway accident. We have good authority for stating that his unavoidable departure is a cause of much regret among those Japanese officials who have had the best opportunities of estimating his abilities. He has already served eleven years in the East, eight as a Consul of the United States—a great portion of which time was spent in the unhealthy port of Tientsin—and three years in Japan.

The promotion of Governor Hennessy, now Sir John Pope Hennessy, to the rank of K. C. M. G. is a very substantial reply by the Government of the Queen to the aspersions and misrepresentations to which his administration of the colony of Hongkong has been subjected by certain newspapers and individuals in the Far East. It shows very clearly and unmistakably that his proceedings in the important questions with which he has had to deal in the colony, have met with the warm approval of the last cabinet. The *Examiner*, a leading weekly organ of the liberal party, and a paper of high literary excellence, refers to Governor Hennessy in the following terms:—"The *Whitehall Review* positively asserts that Mr. John Pope Hennessy, Governor of Hongkong, is to get the vacant Governorship of Queensland. We do not know whether or not the report is authentic, but it would not be surprising if true. Indeed, the probability is that Mr. Hennessy cannot be long left in his present position. Probably no man in that branch of the public service has given such unquestionable proofs of capacity to deal with circumstances of difficulty, and to promote the advantage of communities whose resources require development. He has emphatically the governing faculty. At once courageous and prudent, firm and conciliatory, practical, yet with a high ideal of justice, his rule is peculiarly fitted to lend an impulse to the prosperity of a colony while it guards the interests of all classes. In the natural course of events it is reasonable to conclude that a very distinguished career lies before him." When it is considered that Sir John Hennessy is a staunch conservative on all imperial questions this paragraph is the more noteworthy. The subject of it has already served for many years in tropical countries, and hence his transfer to Queensland is the more probable. But, wherever he may be as an administrator, his broad humanity, love of open-handed and universal justice, his vigour and industry, will command the respect of all those whose respect is worth possessing.

The annual grand rifle match of the *Société Suisse de Tir* has been arranged for Friday and Saturday next, the 14th and 15th instant, the hours of competition being from 1 to 6 p.m. on the first, and from 8 a.m. to 4 p.m. on the second day. At a quarter past four on Saturday the prizes, thirty in number, will be distributed.

We notice in the *Hongkong Daily Press* that a Jirikisha Company has been formed in that city, and commenced operations with thirty vehicles.

The Mitsui Bishi Company's steamer *Nagoya Maru* has just received a thorough overhaul, and will shortly resume its place in the company's line.

The Yokohama Christian Association has issued a circular asking for the support of the community in extending its work and influence. A liberal response should be the result and thus one of the greatest wants in a settlement such as this supplied. From the circular we learn that "the objects of the Association are to promote the social, intellectual, moral and spiritual welfare of its members and to encourage them in Christian work: and to extend to strangers and sojourners in Yokohama social and Christian influence. To further these ends the committee wish to arrange

for regular religious meetings, entertainments and lectures. Besides providing for entertainments and lectures, the Committee desire to establish a Library and Reading room, furnished with chess, draughts and other games, for the use at all times of members and their friends, and for visitors and strangers in Yokohama. Regular Prayer Meetings and Bible Classes will be held—each at least once a fortnight: the latter will be conducted by the Rev. E. C. Irwine. Lectures and entertainments will be given as nearly as can be arranged, each once every month. To enable them to carry out this programme, the committee have secured, at a moderate rent, the hall at No. 39 Water-street, which is stated to be admirably adapted for the purposes of the institution. Unfortunately, the funds of the Association are low; but by the present movement it is hoped to secure fresh accessions of members. In effecting the object desired, no difficulty should be encountered, as the subscription for active members is only \$8.00 per annum, associate members \$4.00 per annum, and ladies \$1.00. Information respecting the society can be obtained from any of the following gentlemen, who constitute the committee of the institution:—Mr. A. J. Wilkin, President; The Rev. E. C. Irwine, M. A., Vice-President; Mr. T. W. Hellyer, Secretary; Mr. A. Owston, Treasurer; The Rev. L. H. Gulick, M. D.; The Rev. T. P. Poute; and Mr. F. Damont.

A recent *Sydney Mail* says:—"The world-renowned Canadian sculler, since his victory over Elliot on the Thames, has been talking 'very big' about coming to Australia to row Edward Trickett for the championship of the world; and some little time since the Australian sculler and his party, feeling convinced, after a correspondence, that Hanlan had no intention of coming over here, resolved to challenge him in English waters. Trickett accordingly arranged to either leave or dispose of his business for a time. When sending the challenge to Hanlan he took the precaution to accompany it with a code of cyphers, so that a reply might be sent by the Canadian at a trifling cost. No answer was received, and the very natural inference here was that Hanlan intended to shuffle out of meeting our champion; and this opinion has been strengthened by what has transpired within the past few days. Trickett having made all arrangements for leaving for England (whither he was to have been accompanied by Mr. P. J. Clark, a well-known amateur oarsman), wisely, before leaving, cabled the following to Hanlan:—'Will go to England, if you will meet me there in July. Reply paid, three words.' Hanlan, apparently having been forced into a corner, replied to Trickett in one solitary word, 'Cannot:' and thus the prospective match, which would have been looked upon with much interest from all parts of the world, has completely faded away. Trickett has done more than he could reasonably be expected to do to bring about a match, and we may presume that, after this, his title to the honours of the first sculler in the world will not be questioned."

We cannot say we agree with the conclusions deduced by the *Sydney Mail* from Hanlan's short reply "cannot." Until further information is received, how can any one say definitely what has interposed to preclude Hanlan from meeting Trickett on English waters? The Canadian has on many occasions proved himself too good and too "square" a man to shuffle out of any engagement, and it is very probable that the Australian champion will have quite enough of Hanlan before their respective merits are finally decided.

About half-past eight o'clock on Tuesday night the ringing of the fire-bells warned the inhabitants that a conflagration had broken out. Guided by the fierce glare reflected in the sky the scene was soon reached, when it was found that the fire had occurred in Isezaki-cho, just across the Yoshida bashi, where so many small shops are situated. The total absence of wind greatly favoured the exertions of the firemen, and the conflagration was got under about twelve o'clock, after having destroyed a great number of small houses. We understand that the fire originated through the upsetting of a kerosene lamp in one of the places of entertainment; the burning oil spread in all directions and the building was in flames before anything could be done to remedy the accident.

In the *Daily Mail* we published an article from the *Saturday Review* on the subject of the imitation butter which, under the name of 'oleomargarine,' is now manufactured in such enormous quantities in America and elsewhere. The simple test we published a short time since for detecting the imposition becomes, in connection with the disclosures of the *Saturday*

*Review*, particularly useful. Nobody, we presume, cares to eat of the refuse from a pork-packing establishment, even although it may be de-aused, scented, flavoured, done up neatly in muslin, and present all the appearance and possess the taste of genuine butter. When we bear in mind the dreadful disease engendered by the trichinum so prevalent in the large piggeries of America, as well as other countries, no precaution can be thought unnecessary, which will prevent the possibility of taking into the system those horrible parasites, which, according to Mr. Michels, may be found in oleomargarine, butterine, or by whatever name the product of the grease factories may be distinguished. The trichinum, as it is pretty generally known, one of the most fearful inflictions that humanity is subject to. They bore their way through the tissues into the blood-vessels, along which they course with the stream, till the fine capillary vessels arrest their progress. Passing through the walls of these, they wander till they reach a congenial resting place in the muscles. An attack of trichinosis is generally fatal, and, under the most favourable circumstances, a severe penalty to undergo for indulgence in imitation butter.

The *Hongkong Daily Press* says that the Occidental and Oriental Steamship Company's steamer *Oceanic*, Captain Metcalfe, arrived in that port on the 22nd April, from Liverpool, via ports of call, having accomplished the passage in thirty-six days, or twenty-nine steaming days. She brings out several passengers, amongst whom is Mr. J. H. Ismay, principal owner, his wife and child. The *Oceanic*, it will be remembered, went to England, after several years' service between this port and San Francisco, for the purpose of being entirely renovated and reboilered. The vessel was placed in the hands of the workmen on the 17th December, and the manner in which the work has been carried out in so short a time is well worthy of notice. The comfort and convenience of the passengers have been considered, the ventilation most efficiently carried out, and the quarters occupied by the officers have likewise been reconstructed. On the upper deck new houses have been erected of iron plates; at the after end are four state rooms, and at the fore end is the captain's cabin; the wheel has been shifted further forward and a house built over it; another state room has been added entering from the upper deck, also a large room, called the vestibule, along two sides of which are seats handsomely upholstered, and the walls are tastefully inlaid with *papier maché*; in the floor, which is inlaid with oak, is cut a large opening, railed off, from which can be seen the handsome saloon below; immediately above this opening and between the captain's cabin and the wheel-house on the upper deck is a glass dome lighting the saloon: and at the fore end of the vestibule are two more state rooms. The saloon has been shortened at the after end and extended at the fore end, and in the space thus obtained retiring rooms, pantries, bathroom, &c., &c., have been constructed. The vestibule occupies the place of the old smoke-room, which has been removed aft, and is a commodious and well ventilated apartment. The ladies' saloon is removed to the upper deck. Some of the state rooms have three ports, but none have less than two, and these rooms will be cool and comfortable in any climate. The water-tight compartments have been altered so that the doors can be securely and quickly closed from the saloon deck by means of screw rods which are in view of the captain or officer in charge. In addition to having received new boilers the whole of her machinery has been overhauled and fitted with the latest improvements. The alterations in the *Oceanic* have been specially made with the view to the ship's safety in the case of a typhoon or such heavy weather as not unfrequently overtakes a vessel in the China Sea, and Captain Metcalfe is well satisfied in this regard with his remodelled ship.

The officers on board the *Oceanic* are:—Captain Metcalfe; Mr. H. Davidson, chief officer; Mr. W. Turpin, second officer; Mr. E. Bond, third officer, Mr. R. Mann, fourth officer; and Messrs. Jones and Green, supernumerary fourth officers. Mr. R. Richards chief engineer; Mr. William, second engineer; Mr. Mills, purser; Dr. Fisher, surgeon; Mr. Russell, freight clerk; and Mr. James, steward.

Hongkong papers announce that telegraphic intelligence has

arrived in the Colony that the honour of knighthood has been bestowed on His Excellency the Governor. Sir Michael Hicks Beach, the late Secretary of State for the Colonies, had, we understand, recommended Mr. Hennessy for appointment as K.C.M.G., and the dignity was conferred upon him on the third anniversary of his assumption of the government of this Colony. His Excellency's friends and admirers will be glad to hear of this mark of the Royal favour.

We have received from Mr. Thos. Seon two pamphlets relative to the "Albany Lubricating Compound and Cups" of which he is the sole agent in Japan. The chief feature in this lubricant is, that being manufactured entirely from petroleum it does not contain fatty acids, is incapable of being decomposed and does not form insoluble soaps. In consequence, it cannot oxidize or corrode the most delicate machinery, and, when used in marine engines with surface condenser, it keeps the tubes perfectly clean. Appended to the pamphlets are numerous certificates of the great value of the compound from engineers of undoubted standing, and, judging from the published results of their experience, the new—at least in Japan—lubricant, should prove a boon to engineers and owners of machinery.

The *London and China Express* says:—"In a late issue we gave the names of the eleven successful candidates for the China and Japan Consular Service, and we now understand that, according to the rules of the service, the option of selecting China or Japan rests with those who pass in priority in the examinations. Accordingly, Mr. Bonar and Mr. Playfair have elected to proceed to Tokio, Japan, and the remainder go to Peking. They will leave by the P. and O. steamer *Nepaul* on April 28. Mr. W. H. Wilkinson, the candidate who passed third, was the scholar to whom was awarded the Davis Scholarship for Chinese. Several appointments of United States Consuls in the Far East are notified, viz.:—Mr. William Mangum, at Tientsin; Mr. Alexander Jones, at Nagasaki; Mr. William Scroggs, at Canton; Mr. Joseph Wingate, at Foochow, and Mr. John Haldeman, at Bangkok.

We observe in an Indian paper that a native of Calcutta has been fined Rs. 50 for having sent a cot or bier into a house during the performance of a marriage ceremony, "indicating thereby that it would have been better for the guardians of the girl to have performed a burial ceremony than to have given her away to such a worthless individual as the man to whom she had been wedded."

The Rumpa rebellion has long afforded cause for amusement and derision to the official class in India, and has at last come to be looked upon as a sort of hobby or plaything of the Governor of Madras, the Duke of Buckingham. The *Civil and Military Gazette* recounts the death of the leading spirit in the Rumpa outbreak, a result which was entirely due to his own want of precaution. If Chendriah had only exercised proper foresight and surrounded his trysting place with microphones, telephones, and other phones; micrometers, and other meters, it is probable that our contemporary would not have had the opportunity of penning the following story of deceit and capture:—

Maharajah Chendriah, the leader of the Rumpa rebels, has succumbed, not to the Duke of Buckingham and his two thousand troops, but to a Delilah of the tribe. The story is worth knowing. While hiding at a place near Bemaram, where Major Hands was watching him, Chendriah—having nothing better to do, as the Madras chronicler ungallantly puts it—fell in love. Her name, which one would like to know, is not given. She is only described as the daughter of Gool Sing, a palat of the place. Chendriah being a man of low caste, old Gool did not take kindly to the match; but as he dared not displease the Rumpa hero, he consented, and then secretly planned his prospective son-in-law's destruction. Two of Chendriah's own followers joined in the plot; and so, it is said, did Miss Gool Sing; but we are slow to believe this, for it is clear from the story that her villain of a father might have managed without her. Chendriah received what he believed to be an invitation from Miss Gool Sing to meet her in the jungle: nor did the grass grow under the maharajah's feet as, accompanied by his two followers, he hurried off to the trysting spot. After a time an ugly suspicion crossed Chendriah's mind; so he fired on one of the traitors, who firing in return, smashed Chendriah's arm. Chendriah then sat against a tree and with the help of his feet and remaining hand contrived to load and fire, and even punish an assailant. Then somebody

went behind the tree with a billhook, and after a tumble shaved off Chendriah's head. So therefore the Duke's war is dying out. The Duke felt rather proud of the Rumpa business,—which, by judicious nursing he developed from a one-horse affair which forty policemen might have crushed out in a week, into a regular war which has lasted for about a year, and in which he employed as large a force as that with which Roberts took Cabul. It is said the Duke never could understand why the Afghan war so completely snuffed out—in so far as public interest and laudatory despatches were concerned—the Rumpa war. He once took the field in person—or did the next thing to it—and yet no flattering telegrams arrived from the Secretary of State and the Queen-Empress. We believe the Duke contemplated the issue of opposition despatches, in which all the Madras officers were to be recommended for K.C.B.'s, and the officers commanding compared to Alexander the Great, Chandragupta, and the Duke of Wellington.

The *Friend of India* contains some remarks on the tea trade of that empire which will certainly prove interesting and may be useful. That journal says:—"We have on more than one occasion spoken of the necessity for great efforts in the direction of making Indian tea by some cheaper method. It seems evident that the present low prices at home are not, as has been supposed, abnormal prices, but the ordinary prices which the very materially increased production has brought about. So long as this increase was followed by a corresponding increase in consumption, prices did not suffer, but now that it is evident that consumption has failed to keep pace with production, we must meet the depreciation in price, either by reducing our exports to the United Kingdom, or by so reducing our producing expenses that we shall be able to accept, without loss, the very much lower rates now obtaining for our teas. Regarding the former alternative, there seem to be two important markets which we have neglected, Australia and America; and it is only by finding new markets that we can hope to reduce our exports to Great Britain. A movement has been all but consummated here, having for its object the opening up of Australia as a market for our teas. The present consumption in the Australian colonies is about 15 million pounds, and the half of this secured to India would relieve the London market, materially reduce stocks, and tend largely towards an increase in value. This consumption in a few years will rise to 20 million pounds, or half the production of India, and as all this large supply is at present drawn from China, there is no reason why our teas should not try to compete with China teas. Now we come to the United States of America, which derive nearly all their supplies from Japan. Their consumption of Japanese teas is at present 32 millions, and of Indian teas almost nil. There seems no reason why the Americans should not be induced to try our growths. There remains the cheapening of production. As we have repeatedly said, no tea should cost more than eight annas per pound, and whether the normal selling price of tea stands as at present, or rises to the rate at which it stood a few years ago, shareholders should all the same insist on having their tea made at eight annas per pound. In fixing this rate we have not forgotten the labour difficulty in Assam, but have made allowance for it. In districts where this difficulty does not exist, the tea should not cost so much as eight annas per pound. In the upper provinces, for instance, where labour is plentiful and cheap, tea need not cost over seven annas per pound, laid down in Calcutta. A letter in our issue of the 19th speaks of a Company paying its Calcutta Agents an agency fee equal to 12 per cent. on the gross proceeds of last season. It is too much, in these days, to expect that a tea business could stand such a charge. It behooves shareholders to take a warmer interest than they have hitherto done in their own concerns, and they will doubtless find that there are many items of expenditure on which the pruning knife might be used with advantage. While we sympathise with 'An Unfortunate Scripholder,' who signs the letter referred to, we cannot help remarking that the cause of these excessive charges is due very largely to the apathy shown by scripholders in general."

We read in an Indian paper that "Mr. Sims Reeves has, at last, decided to relinquish the active exercise of his profession, and next autumn he will commence a farewell tour of Great Britain. The tour will probably extend over two years, and before Mr. Reeves makes his last bow to an audience he will introduce to the public his son, who is now studying in

Italy. Mr. Sims Reeves was born in 1821, at North Cray, near Woolwich, and where his father was parish clerk. He was educated under J. B. Cramer, Tom Cooke, Hobbs, and other masters, and subsequently at Milan, at the cost of the Rev. Edgell Wyatt-Edgell, vicar of North Cray. He first appeared at Newcastle in 1839 as a baritone, but his real *debut* as tenor was in 1847 at Drury Lane, when he sang *Edgar* in "Lucia" under the late M. Jullien. Mr. Sims Reeves will thus make his final appearance next year at the age of sixty, out of which forty-two years have been spent in the service of the British public.

If the republicans of France have any confidence in the stability of the republic, it is manifest that some measures must be adopted to remove the existing anomaly of magnificent Crown Jewels locking up an enormous amount of money, the property of a state which has discarded monarchical institutions. Sometime ago it was mentioned that the diamonds comprised in the collection, which alone are valued at forty millions of francs, and contain among other treasures the celebrated Regent, alone worth eight millions—were to be sold. But we now learn that the Government, loth to disperse a collection of such artistic value, yet anxious to conciliate those republicans who wish the crown to be sold because they don't want any one to wear it, have decided upon the following course. The Crown diamonds will be divided into three classes:—

1. The heraldic ones, having some artistic or historical interest. These will be deposited in the Apollo Gallery of the Louvre, and among them the famous Regent.
2. The diamonds having a special mineralogical value will be sent to the Museum of Natural History.
3. Those which may be considered mere jewellery, and of which the value is estimated at three millions of francs, will be sold for the benefit of the Museum funds.

On the 5th instant, Colonel Munier and five other members of the French military mission to the Japanese army, and the French employees in the Educational Department, were received in audience by His Majesty the Emperor, at 2 p.m. They were each presented with some pieces of red and white silk brocade, His Majesty and thanked the French military officers for their long and arduous services in the Japanese army.

We learn that Mr. Tanetaro Mógata, the Japanese Barrister who was last year admitted to practice in the United States Consular Courts in Japan, has lately been appointed to an important post in the Judicial Department. His functions are, we understand, to be somewhat similar to those of a public prosecutor, or the procurators-fiscal in Scotland. This appointment has been rendered necessary by the provisions of the new criminal code, and from all we can learn on the subject, Mr. Mógata is admirably adapted for the position—in fact, "the right man in the right place."

The following recommendations had been made up to the 27th of March, by the Judges at the Sydney Exhibition in the classes mentioned with reference to the exhibits from Japan:—

CERAMICS, POTTERY, PORCELAIN, &c. :—S. Notomi, Tokio—1st class; K. Miyagawa, Yokohama—1st class and special mention; Koransha, Hizen—1st class and special mention; M. B. Kuwaisha, K. K. Kuwaisha, and Okura and Co.—1st class; S. Kuwaisha, Nagoya, Owari—1st class; Hio-Chi-Yen-Sha, Tokio—1st class; D. S. Kausaw, Kioto—2nd class; D. Takahashi, Kioto—2nd class; S. Kiukozan—2nd class; Yenji Nishi-Woora, Nino—2nd class; S. Shimada, Osaka—2nd class; M. Ota, Tokio—2nd class; Y. Marn, Tokio—2nd class; H. Matsumoto, Tokio—3rd class; R. B. Shimidzu, Kioto—3rd class; K. Waki, Kioto—3rd class.

YARN, WOVEN, AND FELTED GOODS, &c. :—Tatsuzo Matsumoto, floorcloth—3rd; Mitsui Bussan Kuwaisha, cotton rugs—4th; Woohei Ota, Osaka, cotton canvas—4th; Goichi Sakai, Osaka, cotton cloths—4th.

VEGETABLE PRODUCTS :—Goichi Sakai, Osaka, sugar candy—1st class.

From the 22nd of March up to the 1st of April, only three vessels sailed from New York for Anjer. They left as follows:—

March 22nd, <i>Lizzie H.</i> ... ..	29,790 cases kerosene.
" 25th, <i>Cometen</i> ... ..	17,300 " "
April 1st, <i>Genoa</i> ... ..	29,764 " "
	76,854 " "

The barque *Haze* sailed for Yokohama on the 25th of March with 25 bbls. sugar, 175 do plaster, 1 pkge. hardware, 490 cases slates, 46 pkgs. glassware, 20,000 cases petrol., 13 cases chandeliers, 4 cases springs, 193 bxs. clocks, 49 kegs ink, 1 safe, 1 bbl. whiskey, 10 pkgs. paint, 1 case plated ware, 25 cases blacking, 56 do founts, 46 pkgs. lamp goods, 6 do pumps, 3 boilers, and 2 sleighs. The barque *Obed Hunter* sailed for Kobe on the 27th of March with 100 cases blacking, 50 bbls. sugar, 125 do plaster, 25 do naval stores, 20 bales oakum, 52 cases scales, 1 case wooden boxes, 5 cases pencils, 500 do slates, 30 pkgs. mfd. iron, 13 bales duck, 1 bbl. twine, 64 pkgs. cordage, 3 cases furniture, 25,000 cases petroleum, 192 pkgs. glassware, and 504 bags hoofs.

The *Henrietta* sailed for Shanghai on the 23rd March and at last dates the *Paul Jones* was loading for that port, the *John M. Clerk* for Hongkong, and the *Punay* for Yokohama.

The *San Francisco Chronicle* says that Emma Wightman, who has seen only nine summers, sends the following solution of the "Fifteen Puzzle," which she believes is complete; and hopes that hereafter there will be no further additions to the lunatic asylums from this craze. Any one who endeavors to solve the puzzle, learns in a few minutes' trial how to place the first three rows—viz, from 1 to 12—in proper consecutive order. The difficulty then begins with the last three numbers, which must assume one of the following six combinations: 1st—13 14 15. 2nd—13 15 14. 3rd—14 13 15. 4th—14 15 13. 5th—15 13 14. 6th—15 14 13.

If the first of these possible combinations presents itself, the problem is solved. If the fourth—viz, 14 13 15 appears, move 12 down, 11 to the right, 13 up, 14 15 right, 9 down, 10 11 left, 12 up, 14 15 right, 13 down, 10 right, and 9 up. If the fifth—viz, 15 13 14—presents itself, then move 15 13 14 right, 9 down, 10 left, 15 up, 13 14 left, 12 down, 10 11 right, 9 up, 13 14 left, 15 down, 11 left, and 12 up. The second, third, and sixth combinations each involve a change in place of adjoining numbers, and consequently can only be solved by giving the box a turn to the left, when the numbers will present this position:

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

Then proceed to arrange the first three rows as before, with the numbers lying on their sides, and when so arranged, the combinations that are incapable of solution—viz., second, third, and sixth—will have disappeared and either the first, fourth, or fifth, present itself, which can be worked off by the rules given above.

#### THE "16" PUZZLE.

"Fifteen" has proved to be a good and interesting puzzle, but that of "16" has been neglected, being either more difficult or apparently too easy of solution. Take the numbers thus:

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

Add them, producing 34 longitudinally, latitudinally, and diagonally, and completing the solution by showing 34 from five squares. When worked out, the figures will stand:

1	15	14	4
12	6	7	9
8	10	1	5
13	3	2	16

The *Irish Law Times* says that, at an examination for admission to the bar, the question was asked: "What is the rule in Shelley's case?" One of the class answered: "The rule in Shelley's case is the same as in any other man's case. The law is no respecter of persons."

EDWIN WHEELER, M.D.

**REUTER'S TELEGRAMS.**

The subjoined are from Indian papers:—

London, March 30th.

Lord Hartington has delivered a speech in which he said that the Liberals, if returned to power, would retire our forces from Afghanistan with the smallest loss of credit, and the smallest sacrifice of the real interests of India.

An uproarious meeting was held yesterday at Wexford at which Mr. Parnell was present, when he was attacked and maltreated.

FROM THE HONGKONG "DAILY PRESS."

London, 23rd April.

Lord Hartington has been summoned by the Queen, and afterwards had an interview with Lord Granville and Mr. Gladstone. He returns to Windsor to-day.

London, 24th April.

Ghuzni has been captured after a desperate engagement. The enemy's loss is heavy, that of the British trifling.

London, 26th April.

The following appointments have been made in the new Ministry:—Lord High Chancellor, Lord Selborne; Secretary of State for War, Mr. Childers; Secretary of State for India, Lord Hartington; First Lord of the Admiralty, Lord Northbrook; Chief Secretary for Ireland, Mr. Forster.

London, 28th April.

The following appointments have been made in the new Ministry:—

Viceroy of India .....The Marquis of Ripon  
Secretary of State for the Colonies ...Lord Kimberley.  
Secretary of State for Home Department .....Sir W. V. Harcourt.  
Lord Privy Seal.....The Duke of Argyll.  
President Privy Council .....Earl Spencer.  
Chancellor Duchy of Lancaster.....Mr. John Bright.  
Under-Secretary of State for Foreign Affairs .....Sir Charles Dilke.

London, 29th April.

Mr. Grant Duff has been appointed Under-Secretary of State for the Colonies.

**THE TWO THOUSAND GUINEAS.**

The following is the result of the race:—

Petronel .....	1
Nuncaster .....	2
The Abbot .....	3

[The name of the second horse in the Two Thousand has probably been mutilated in transmission. It is very likely to be Muncaster, owned by the Duke of Westminster, and trained by Robert Peck at Russley. The winner belongs to the confederacy over which Captain Machell presides, and is in Joseph Cannon's string at Newmarket.—*Ed. D. P.*]

LONDON, 4th May.

Mr. Chamberlain has been appointed President of the Board of Trade, with a seat in the Cabinet. Mr. Fawcett, Post-Master General. Earl Cowper, Lord Lieutenant of Ireland.

**YOKOHAMA AMATEUR ATHLETIC ASSOCIATION.**

On Saturday last the Spring meeting of this Association took place at the Rifle Range. Owing to the heavy rain which fell during the previous day, the running path was in anything but good order, and in several places the reverse of light going. The band of the *Kio do dans* was on the ground, and played a selection of music during the afternoon.

**1.—100 YARDS FLAT: HANDICAP. Two prizes.**

F. V. Samuels, 1 yard ...	...	...	1
C. E. Churchill, 5 yards ...	...	...	2
J. W. Whitmore, scratch ...	...	...	0
F. W. Strange ...	...	...	0

A very good start, Samuels slightly the quickest in getting away. At fifty yards from the tape Churchill and Samuels were level, with Whitmore third. From this to finish it was a tight race between the two former, Samuels eventually winning by about two feet. Time, 11 secs.

**2.—THROWING AT WICKETS. One Prize.**

J. W. Whitmore ...	...	...	1
--------------------	-----	-----	---

For this event Dare, Walker and Whitmore tied with one wicket down to each. In throwing off Walker and Whitmore again tied, but at the third trial the latter obtained the prize.

**3.—150 YARDS FLAT: HANDICAP. Two prizes.**

H. A. Herbert, 8 yards ...	...	...	1
F. V. Samuels, 4 yards ...	...	...	2
Wm. Sutter, 12 yards ...	...	...	3
S. Cope, 6 yards ...	...	...	0

Four started for this race and the running was very close from start to finish. Sutter led for the first hundred yards, but was then passed by Herbert and Samuels. After a smart finish the former came to the front a winner by one foot. Time, 16 secs.

**4.—LONG JUMP: HANDICAP. Distance to be reckoned from the scratch. One Prize.**

H. A. Herbert, 18 inches ...	...	...	1
A. H. Dare, scratch ...	...	...	2

This was won easily by Herbert, who covered 18 feet 10 inches without his handicap allowance. Scratch failed to clear more than 18 ft. 2 in.

**5.—440 YARDS FLAT: HANDICAP. Two Prizes.**

H. A. Herbert, 20 yards... ..	...	...	1
S. Cope, 15 yards... ..	...	...	2

Herbert maintained his position with ease from start to finish. In the last fifty yards Whitmore came level with Cope, but could not keep his position and fell back to third. Time, 58 secs.

**6.—PUTTING THE SHOT: 16 LBS. (Only 7 ft. run allowed, no follow). One prize.**

G. W. F. Playfair, 6 inches ...	...	...	1
F. G. Richmond, 6 inches ...	...	...	0

This was one of the best events of the day; and up to the last 'put,' it was very doubtful who would take the prize. It was eventually won by Playfair, although Richmond made the best throw—28 ft. 11 in., but in doing so unfortunately overstepped the mark by an inch and was disqualified.

**7.—LADIES' PURSE. 600 YARDS FLAT: HANDICAP. Open to Members of the Association only. One Prize,—“The Purse.”**

Wm. Sutter, 45 yards ...	...	...	1
F. V. Samuels, 12 yards ...	...	...	2

The field got away to a good start, but on the first round Dare and Cope went out of the race. Samuels tried hard to reach Sutter, but could not succeed in getting nearer than twenty yards. Time, 1 m. 29 secs. The winner was afterwards presented with the prize by Mrs. Reeves.

**8.—880 YARDS FLAT. For non-commissioned officers and men of the men-of-war in port. No entrance fee. Five competitors to start or no race. Entries made on the ground. Three prizes,—\$5, \$3, and \$1.**

Williams, H.M. S. <i>Modeste</i> ...	...	...	1
Carsou, U.S. S. <i>Alert</i> ...	...	...	2
Ebers, H.M. S. <i>Modeste</i> ...	...	...	3

Thirteen started.

**9.—HIGH JUMP: HANDICAP. One Prize.**

Wm. Sutter, 5 inches ...	...	...	1
F. W. Strange, scratch ...	...	...	0

This was won by Sutter, who cleared 4 ft. 6 in. with the greatest ease; while scratch declined a second try to get over 4 ft. 8 in.

## 10.—100 YARDS FLAT: HANDICAP. For boys under 12 years of age. Entrance free. Prizes.

FIRST HEAT.				
G. Hood ...	...	...	...	1
F. Wilkin ...	...	...	...	2
C. Gibbs ...	...	...	...	3
SECOND HEAT.				
J. Eyton ...	...	...	...	1
F. Collins ...	...	...	...	2
A. Urquhart ...	...	...	...	3
FINAL HEAT.				
J. Eyton ...	...	...	...	1
F. Collins ...	...	...	...	2
A. Geffeney ...	...	...	...	3

## 11.—880 YARDS FLAT: HANDICAP. Two Prizes.

S. Cope, 35 yards...	...	...	...	1
F. V. Samuels, scratch ...	...	...	...	2

For this four started, but two pulled up at the dressing room. Samuels ran hard, but was unable to reach Cope, who came in as he pleased. Time, 2 m. 24 sec.

## 12.—150 YARDS FLAT: HANDICAP. For honorary members of the association, married men, and visitors, non-residents. One prize. Entries made on the ground.

E. F. Kilby ...	...	...	...	1
Hon. F. Spring Rice ...	...	...	...	2
C. Ward ...	...	...	...	3
A. H. C. Halselwood ...	...	...	...	0
Rev. Mr. Irwin ...	...	...	...	0
H. Ahrens ...	...	...	...	0
C. Rasch ...	...	...	...	0
F. A. Cope ...	...	...	...	0
L. W. Kuchler ...	...	...	...	0

Time, 17 sec.

## 13.—HURDLE RACE. 120 YARDS, OVER 10 FLIGHTS: HANDICAP. One Prize.

G. C. Charlesworth, scratch ...	...	...	...	1
Wm. Sutter, 12 yards ...	...	...	...	0

Two started, but Sutter retiring Charlesworth came in alone.

## 14.—300 YARDS FLAT: HANDICAP. For boys between 12 and 15 years of age. Two Prizes, 1st Presented. Entrance Fee, 50 sen. Six to enter or no Race.

E. Martin ...	...	...	...	1
C. Smith ...	...	...	...	2

Six ran.

## 15.—ONE MILE FLAT: HANDICAP. Two prizes.

F. W. Strange, 60 yards ...	...	...	...	1
S. Cope, 100 yards ...	...	...	...	2

Four started for this. Herbert retired at the dressing room on the first round. Dare continued and at the finish of the third lap pulled through his handicap and passing Strange and Cope fell out of the race. Strange then went to the front and came in alone. Time 5 m. 19 sec.

## HURDLE RACE FOR BLUE JACKETS. Prizes. \$10, \$6, and \$3

Foley ...	...	...	...	1
Morris ...	...	...	...	2
Triggs ...	...	...	...	3

This was run in three heats, and resulted above.

## 16.—TUN-OF-WAR. Open to Teams of 10 Men from the Men-of-War in Port. Prize,—\$10 to Winning Team.

Marines, H. M. S. Modeste ...	...	...	...	1
Blue Jackets, " ...	...	...	...	2

This was won by the marines, who afterwards 'tugged' a civilian team, the latter winning easily. There were ten on each side, the shore team weighing somewhere in the neighbourhood of 1,998 lbs.

After the sports were ended, the prizes were presented to the successful competitors by Mrs. Irwine.

impossible for such an old man to carry it about with him. At length the niggard hit upon a plan. He put his earnings in a *safu* (money bag) and then sank the bag in the *nukamiso-oki*,\* covering it over carefully with the pickled vegetables.

Every evening on his return from labour the old man used to take his *safu* and pass the time in the only enjoyment he had in life—counting over his treasure. This did not last long however. One day he was watched by a neighbour, who, when the old fellow went to work the next day, fished up the bag and appropriated the contents.

The old miser was in a frightful paroxysm of grief and despair when he found his money gone. Life seemed to have lost all its charm; in fact to be no longer worth living. He could not settle down to work and passed the day brooding over the loss of the savings of many years of toil and penury. At last some of the neighbours took pity upon him, and reported the circumstances to the local magistrate, asking at the same time that an inquiry should be held.

The magistrate, accordingly, summoned the old fellow to his presence, and, after hearing what he had to say, asked:—

"Is there nobody then whom you suspect? Have you many visitors? Who has been at your house lately?"

"Your honour, I do not entertain the least suspicion of any one. I have no friends or visitors, as I find they entail great expense. There are many dwellings adjoining mine; and as the occupants pass along my verandah I sometimes hold converse with them."

"Well, then, I will try to get your money back for you. Come here again to-morrow when the Court opens."

On the miser arriving at the temple of justice the following day he found all his neighbours, old and young, assembled there also, waiting the opening of the court.

When the magistrate took his seat, and the parties were all kneeling in front of him, he addressed them in the following words:—

"The complainant has reported to me that a large sum of money, his property, and which he kept in his *nukamiso-oki*, was stolen the day before yesterday. I am informed that this *nukamiso-oki* is very old and has been in use for many years. The odour from it must therefore be very strong and penetrating. The complainant informs me, further, that he has no visitors, and as you, his neighbours, are the only people likely to have been aware of the place in which he kept his money, it is certain that one of you must be the thief. I shall accordingly now proceed to smell the hands of each of you myself, as I am of opinion that the hand that was plunged into the *nukamiso-oki* to take out the *safu* must still retain the smell of the tub. Thus undeserved suspicion will be removed from the innocent and the guilty suffer."

As the magistrate was finishing speaking a crafty looking fellow, about forty years of age, stealthily raised his hand from the mat and smelt it. The magistrate, who had been attentively observing the countenances of his auditory, noticed the action and at once exclaimed, pointing to the man who had smelt his hand:—

"Take that fellow to gaol. He is undoubtedly the thief. Probably he thought the odour of the tub might still remain on his hand and he wanted to see if he was safe on that score."

Search being made, the *safu* was found in the accused man's house with the money intact. Thus the old miser recovered his treasure through the clever device of the local magistrate.

M.

## JAPANESE NEWS.

[The following Notes on various Japanese matters are chiefly derived from the native papers, occasionally supplemented from original sources of information, and are carefully collated and edited, so as make them readable and intelligible.]

## GOVERNMENT NOTIFICATION.

The Minister of Finance issued the following notification to the Stock Exchange Office in Tokio, on the 3rd instant:—

"It is hereby notified that the prohibition against the purchase

\* A tub in which various kinds of vegetables are pickled with rice-bran and salt; and to be found in every Japanese house. A dish of these pickles invariably occupies a corner of the table at every meal.

## JAPANESE PARABLES.

## VI.

IN a certain poor but densely populated district of Tokio, there lived, in the "good old times," an aged artisan, who had succeeded in accumulating a considerable sum of money by the practice, during many years, of the most grasping parsimony.

Living the lonely and cheerless existence of a miser, he thought it unsafe to leave his treasure in the house when he went abroad to follow his daily avocation and, at the same time, its weight was so considerable that it was

and sale of gold and silver coin in your office having been removed, transactions may again take place after to-morrow, the 4th instant."

A similar notification was issued to the Exchange Office in Yokohama the same afternoon, and operations recommenced accordingly.

#### COURT, POLITICAL AND OFFICIAL.

A native journal mentions that private meetings among the *Chokunin* officials and secretaries of the Cabinet, are frequently taking place at present.

Mr. Yamaoka, Chief Secretary of the Imperial Household Department, and Mr. Nishimura, Under-Secretary of the Home Department, accompanied by their subordinate officers, will leave the capital on the 10th instant, to precede the Emperor on his forthcoming visit to the provinces.

Mr. Morioka, Governor of Hiogo, has received the insignia of the Order of Gabriel from the King of Italy.

His Excellency Yanagiwara, Envoy Extraordinary and Minister Plenipotentiary to the Court of St. Petersburg, has entertained the Prime Ministers, the Privy Councillors and some prominent gentlemen.

The local assembly of the prefecture of Chiba was opened on the 1st instant, and the assembly of Gumbu on the 2nd instant.

We (*Mainichi Shimbun*) hear that Her Majesty the Empress Dowager will visit the shrines in the province of Ise during August or September next.

Mr. Kondo, Consul for Fusan, Corea, arrived at his post on the 23rd ultimo, in the *Kanko Maru*.

His Majesty the Emperor was present at the recent races in the Fukiage park. The competing horses were all bred in Yesso.

His Majesty the Emperor entertained the Princes of the Blood, the Prime Ministers, the Privy Councillors, and the Ministers of the different Departments, at noon on the 4th instant.

Her Majesty the Empress left the palace at 1 p. m. yesterday, and proceeded to the botanical gardens at Naito, Shinjiku, to see the Wisteria in blossom.

Mr. Watanabe, Governor of Osaka, was appointed a member of the Senate on the 4th instant.

On the same day Mr. Tachino, Secretary of the Imperial Household Department, was appointed Governor of Osaka.

Mr. Maida, an attaché of the Finance Department, who lately visited the district of Kinshiu on a tour of inspection, returned to the capital on the 3rd instant.

Judge Tsurumine, President of the Fukushima Joto Saibanho, will proceed to his post on the 15th instant.

As the Kencho of the Okinawa Ken is to be established at Shuri, the capital of Loochoo, the Governor of that prefecture has applied to the Home Department for a grant of money to defray the necessary expense of building.

It has been telegraphed that Mr. Yoshida, Envoy to Persia, and his staff, arrived safely at Hongkong in the *Iiyei Kan*, and that they will embark on board an English mail steamer, and proceed to Persia via Bombay.

His Excellency Yanagiwara, Envoy Extraordinary and Minister Plenipotentiary to the Court of St. Petersburg, will leave for his post about the 14th instant. His Excellency Nagaoka, Envoy Extraordinary and Minister Plenipotentiary to Holland, will also leave about the 27th or 28th instant.

The Minister for Austro-Hungary inspected the Printing Section of the Finance Department, on the 4th instant.

The Chinese Minister was entertained at the German Legation on Tuesday last.

Kwazoku M'ezano, who arrived in Tokio a few days since as a representative of the Kioto nobles, to inquire after the health of His Majesty, left the capital for the Southern city on the 5th instant.

The memorials addressed to the Senate from different localities demanding the establishment of a national assembly, now amount to about fifty, and the Government is going to send replies through the local authorities.

Mr. Senator Mitukuri and Judge Ikeda, have been appointed to revise the civil code.

His Excellency Prime Minister Sanjo is going to entertain the foreign Representatives and Consuls and the Japanese

Ministers and Consuls who are to be despatched to foreign countries, at his official residence on the 10th and 11th instant. His Imperial Highness Prince Higashi Fushimi is going to give similar entertainments on the 11th and 12th instant.

Mr. Tachino, the new Governor of Osaka, is going to leave for that city on the 11th instant.

Mr. Maida, Consul General for Gonsan, Corea, left for his post on the 5th instant, in the *Hiroshima Maru*.

Messrs. Murata, Vice-Grand Secretary, and Yamawaki, Vice-Under Secretary of the Daijo Kwan, have been ordered to visit Germany.

It is said that Mr. Fukuoka Kotei, the ex-Assistant Minister of Justice, who is now coming to Tokio from Kochi, will be made a member of the Senate on his arrival in the capital.

Judge Kiyooka, President of the Osaka Joto Saibanho, and Judge Sakamoto, President of the Miyagi Saibanho, are shortly to return to their respective offices.

The local assembly of Tokio Fu is to be opened about the 15th of this month.

#### NAVAL AND MILITARY.

The statement that Lieutenant-General Ibi had been appointed to the command of the Hiroshima garrison, is incorrect; he has been nominated to the Nagoya garrison, and Lieutenant-General Kurokawa placed in command of the Hiroshima garrison.

On the 29th ultimo General Tani was appointed director of the military college and the military school; Lieutenant-General Soga was transferred from the command of the Kumamoto garrison to that of the Osaka garrison; Lieutenant-General Takashima from the office of director of the Kiododan to the command of the Kumamoto garrison; Lieutenant-General Shijo from the Nagoya garrison to the Sendai garrison; and Lieutenant-General Miyoshi was appointed chief of the eastern section of the staff office.

There will be a shooting match on the 9th instant, at the rifle range belonging to the Navy Department, at Shiokane Daimachi, under the auspices of His Excellency Vice-Admiral Enomoto, Minister of the Navy, Vice-Admirals Nakamura and Ito, and Rear-Admirals Akamatsu, Nirei, Hayashi, and Ito.

The Navy Department is going to make a chart of the Korean coast, and a number of officers are to be despatched to Corea in the beginning of next June to survey.

A Naval Observatory is to be established at the 5th street of Katamachi, Higashi, Tokio.

Lieutenant-General Takashima, the commander of the Kumamoto garrison, will proceed to his post about the 20th instant.

About 110,486 *tsubo* of land in Yokosuka, Senu-shima, and Natsu-shima, have been brought under the jurisdiction of the War Department for the purpose of coast defences.

Kanji Hosokawa has been appointed Commissioner, and Senators Kawano, Tsuda, Tamano, and Tsuruda, members of the Committee, for compiling a new military code.

#### INDUSTRIES, TRADE AND FINANCE.

We notice in a native paper that Mr. Sano Yachi, a wealthy farmer at Amaki, in the prefecture of Fukuoka, who recently purchased the *Takao Maru* from the Navy Department, is about to buy more vessels abroad, for the purpose of entering into competition with the Mitsui Bishi Company.

As the antimony mines of the province of Oshiu produce a far greater quantity of the mineral than is required to supply the wants of Japan, it is proposed to commence exporting the surplus. The cost of transit, from the mines to Tokio, is one yen per *kwanme*, and as the antimony is sold at three yen and fifty *sen* per *kwanme* in the capital, the industry is very profitable.

A silver mine has been discovered near the village of Sugamura, in the province of Yamashiro.

On the 29th ultimo the *Shizuoka Maru* arrived in Yokohama with 1,462 packages of the new season's tea.

Trade between Japan and Corea is developing so rapidly, that the Mitsui Bishi Company are reported to contemplate placing the *Wakanoura Maru* permanently on the line between the two countries.

Twenty thousand bags of rice were received in Tokio a few days ago, from the prefecture of Awamori.

The sum of 30,694 yen is to be handed over to the authorities of Ishikawa Ken, to defray the expenses of the construction of the harbour at Sakai.

The Osaka Mint is ordered to coin a quantity of five and ten sen silver coin, of which there is a great scarcity.

The *Bakka Shimpō* states that, on the 29th ultimo, the Yokohama Specie Bank lent 26,550 yen in specie at 8 per cent interest, on the security of 40,621 yen 50 sen in paper currency, which is therefore at the rate of 1.53 yen in paper for each yen in silver. On the 30th ultimo, advances were made to the extent of 66,670 yen in specie, on the security of 100,681 yen 70 sen in paper, or at the rate 1.51 yen per yen in specie. All the loans have been made to merchants engaged in foreign trade, and not to speculators.

The *Osaka Shimpō* says that "some Chinese traders lately requested the Japanese Junk Company of Kami-dori, Ajikawa, Osaka, to commence regular communication with Formosa by means of sailing vessels. The company agreed to the proposal, and received 10,000 yen as security from loss, besides which they would be entitled to the freights. A contract was thus completed and the company tried to engage a captain for the pioneer vessel of the line, but could not succeed, as everyone was afraid of the dangers of the voyage. The company became greatly annoyed, and telegraphed to Yokohama to see if they could procure a captain there, but all in vain, and now no course is open to them but to return the deposit and pay compensation for breach of agreement."

The revenue collected at the Yokohama Custom House during the past month amounted to 140,036 yen 56 sen.

On the 3rd instant the *Kiyokura Maru* brought to Yokohama 1,045 packages of tea, the *Seicho Maru*, 1,395, and the *Shi-uoka Maru*, 2,207.

The Government are about to sell the rice from the godowns at Asakusa, in order to reduce the price of this article of consumption.

The number of visitors to the Bazaar in the Swamp Gardens from the 21st until the 30th of last month, amounted to 36,436. The articles sold realized 2,715.94 yen.

#### MISCELLANEOUS.

A class for the study of the Korean language is to be established in the Educational Department, and a Korean who is now in the employment of the Foreign Department is to be engaged as teacher. This gentleman is stated to be a warm patriot and much grieved at the uncivilized condition of his country. He is reported to have said that Li Hung Chang of China wrote to the Korean Government last year, suggesting that the country should be opened to foreign intercourse, but that the Korean Prime Minister rejected the proposal.

The *Chōya Shimbun* says that "the Chinese Government has prohibited opium-smoking throughout the whole of the Empire, and after two months, if any one violates the law on the subject, he will be very severely punished."

A new lighthouse is to be erected on the summit of the Jinsantoge, situated between the provinces of Musashi and Sagami, for the guidance of ships entering the port of Yokosuka, by night.

A new telegraph office is to be opened at Yoneko, in the province of Hoki.

The *Yamagata Shimbun*, published in the province of Uzen was suspended on the 27th ultimo.

A fire took place at Kita-Katsushika-gori in the prefecture of Saitama at midnight of the 27th ultimo, and destroyed 115 houses before it was extinguished at 4 o'clock the following morning. The fire being a very large one for such a small village, a subscription was raised for the relief of the sufferers, and 530 yen collected.

Between 250 and 300 people daily visit the Tokio Library. The total number during the month of March last amounted to 6,019, of whom 39 were foreigners.

There has been a continuous fall of heavy rain at Amabe-gori, and the surrounding districts in the prefecture of Kochi for some days past. Consequently the waters in the different streams overflowed, carrying away portions of the embankments, and raising the level of the water as high as from one to two feet above the floors of the houses. None of the buildings were, however, washed away, but in some places the young wheat

was badly injured and the prospect of the local harvest for this year is unpromising.

There will be a Race Meeting will be held at Mita, Tokio, on the 15th and 16th instant.

There was one case of cholera at Shin-miya-cho, Odawara, on the 4th instant. The patient died nine hours after being attacked.

The number of passengers who travelled by the Yokohama and Yokosuka ferry during the month of April, amounted to 21,150 persons.

The number of ships wrecked on the coast of Yesso during the past year is 61 Japanese junks, 17 sailing-vessels, and 1 steamer. 62 persons were drowned and the goods lost comprised about 9,776 koku, 1,600 tons of coal, and 7,512 miscellaneous articles. Of the ships wrecked nine junks and four sailing-vessels can be repaired.

A telegram has been received in Tokio, to the effect that disturbances have occurred among the inhabitants of the district of Hatagori in the prefecture of Kochi, in consequence of the rise in the price of rice.

The Mitsu Bank has discovered three counterfeit two yen notes, and the branch of the same bank at Nagoya discovered seven or eight counterfeit five yen notes.

The following is the number of towns and villages in Japan with their respective population :—

NUMBER.	POPULATION OVER.
57.....	1,000
100.....	2,000
82.....	3,000
66.....	4,000
46.....	5,000
25.....	6,000
17.....	7,000
12.....	8,000
13.....	9,000
40.....	10,000

Besides the above there are many smaller villages whose number and respective population has not, as yet, been ascertained.

#### ARRIVAL OF THE AMERICAN MAIL.

Madrid, April 6th.—Inquiry is proceeding at the Ministry of Finance, relative to the means of developing the Spanish mercantile marine. Señor Armentuza, a Caledonian shipbuilder, in the course of the inquiry, expressed the opinion that the precarious position of Spanish shipping is due to the disastrous competition it has sustained in the Cuban trade, more particularly on the part of the United

States. He urged that Spanish and Cuban shipping be protected by lowering the Consular dues, loading and other charges, and that treaties of commerce be concluded with England and the United States.

London, April 6th.—The Liberals in London are preparing for a great demonstration in honor of Gladstone, on his return here.

The following political gossip from to-day's *World* is given for what it may be worth :

On the recommendation of Lord Beaconsfield, the Queen will, on the occasion of her anniversary, create an Imperial Order of Merit, for civilians only. A large number of civil servants and others will be in the first batch of persons decorated.

Among the titular favors Lord Beaconsfield will bestow before quitting office, Baronetcies will be conferred on Bothwick, proprietor of the *Morning Post*, and J. M. Levy, of the *Daily Telegraph*.

On the formation of the new Cabinet, Parliament will adjourn for a fortnight, to permit the re-election of Ministers holding seats in the House of Commons.

Beaconsfield holds Lytton's resignation as Viceroy of India, to take effect absolutely in case the elections are adverse to the Government. Beaconsfield might, therefore, appoint his successor, but he probably will not, as the new Ministry would almost certainly cancel the appointment.

The O'Connor Don will be offered the Chief Secretaryship for Ireland, and if he declines to serve, Shaw or Lefevre will be appointed.

The difficulty about Gladstone's position will probably be settled by his becoming the head of the new Government, with the understanding that after a year or two he shall retire from Parliament, and be succeeded by Lord Granville. No Minister could lead the House of Commons with Gladstone in the position of irresponsible dictator. He must represent the Government in the Commons, go to the House of Lords, or quit public life.

There will be a strong enough Irish party in Parliament to force concessions from the Whig Government.

St. Petersburg, April 6th.—The *Journal de St. Petersburg*, referring to the alarmist reports relative to the intentions of China, says it is in a position to announce that, according to the latest intelligence from Peking, the Chinese Government manifests a desire to renew negotiations relative to Kuldja, as the treaty concluded by Chung How, late Chinese Ambassador to Russia, cannot be ratified. The Chinese Ambassador at Paris is to come to St. Petersburg to open to negotiations.

Berlin, April 6th.—Prince Bismarck has tendered his resignation as Chancellor of the Empire, because of the vote on financial reform in the Federal Council. The *North German Gazette* makes the following explanation with regard to the resignation : The Bundesrath, on Saturday, discussed in detail the bill imposing imperial stamp duties. A vote was taken on the question whether the receipts for postal money orders should require stamps. The negative majority numbered thirty votes, representing a population of 7,500,000, while the minority numbered 28 votes, but represented a population of over 30,000,000. In consequence of this vote, the Imperial Chancellor officially presented a request to the Emperor to be relieved of his functions, explaining that he could not act upon the resolution of the majority, which was taken against Prussia, Bavaria and Saxony ; and as Imperial Chancellor, he could not take advantage of the benefit conceded to a minority under such circumstances by Clause 9 of the Imperial Constitution.

It is expected that the Stamp bill will be resubmitted to the Bundesrath, and that several of the minor States will go over to the side of Prussia, whereby the requisite majority will be attained.

Paris, April 6th.—The *Pays* (Cassagnac's paper) expresses the opinion that Prince Jerome Napoleon, in writing his letter, just published, committed an irreparable mistake. It exclaims : "If that is the Empire offered us, we reject it with scorn."

London, April 7th.—Herbert Gladstone, Liberal, son of Right Hon. W. E. Gladstone, who was defeated for Middlesex, will stand as a candidate for Leeds, his father, who was returned for Leeds and Middlesbrough, having elected to accept the latter. R. Ashton Cross, Home Secretary, was re-elected for Lancashire Southwest.

London, April 7th.—The *Standard*, in its leading article, asserts that the real significance of the polls is that the Liberals will be able to dispense with the Home Rule vote.

Berlin, April 7th.—In Parliamentary circles it is considered sure that the Bundesrath will reconsider the bill passed by that body, imposing imperial stamp duties, and will agree to the views of Bismarck. The statement that Bismarck tendered his resignation three days ago, and that upon the Emperor's refusal to accept it, he again tendered it on the ground of ill-health, is unfounded. Bismarck only tendered his resignation yesterday. The decision of the Emperor regarding the resignation has not yet been made known.

Athens, April 7th.—Queen Olga, of Greece, has been delivered of a daughter.

Paris, April 7th.—The *Pays* says it hopes that the sons of Prince Jerome Napoleon think differently from their father, and recalls the fact that the late Prince Imperial designated Prince Victor as his successor to the throne. The *Pays* counts on Prince Victor and his brother to fulfil the intentions of the deceased Prince Imperial.

At a banquet at Dijon, the Minister of Finance stated that the Cabinet unanimously approved of the anti-Jesuit decrees. He said the Government would prosecute nobody. It would respect the liberty of conscience, he said, but the law would be rigidly enforced.

London, April 7th.—A correspondent with Gen. Stewart's column at Jildak says the advance continues uninterruptedly. It is reported that there is a strong gathering near Sharjui, where the enemy will certainly fight.

London, April 7th.—A Rangoon special says that several Chinese firms there have received intelligence that Theebau, King of Burmah, has died of small-pox, at Mandalay. Their agents advise them to keep back their goods, as there are fears of civil war in Burmah.

Berlin, April 7th.—Bismarck is so ill that he has not slept for several nights, and walks or stands with difficulty. His family urge rest and quiet.

London, April 7th.—The *Times'* Berlin special says: On all hands it is not for a moment doubted that Bismarck will succeed in carrying his point, and in the interview to which he was summoned by the Emperor he doubtless heard enough to induce him to withdraw his resignation. The rules applying to voting by proxy in the Bundesrath may be modified, though there appears to be no intention of otherwise changing the Constitution. In view of the determined attitude of Bismarck, the Bundesrath will probably recall or correct its vote, while it is said the wrath of Bismarck will not be wholly appeased without the sacrifice of certain high officials.

London, April 7th.—A correspondent at Vienna learns from St. Petersburg that the Russian troops in South Siberia have been ordered to march to the Chinese frontier.

Berlin, April 7th.—The Emperor had a long conference with the Crown Prince, at which it was determined that Bismarck should remain in office.

Berlin, April 8th.—The Emperor has replied by the following Cabinet order to Bismarck's request for permission to retire from office :

"I certainly do not ignore the difficulties in which you may be placed by the conflict between the duties imposed upon you by the Constitution and your responsibility. I do not feel inclined to relieve you of your office, because you believe yourself unable in a particular case to carry out the task allotted to you by the Constitution. I must, on the contrary, leave it to you to submit to me, and subsequently to the Bundesrath, proposals calculated to bring about a constitutional solution of the conflict of duties of this description."

The *North German Gazette* says : "We believe arrangements will be proposed for dealing with the more important matters before the Bundesrath within a limited time, thus enabling the principal Ministers of the various States to be present and avoiding proxy voting."

Paris, April 8th.—The Duchess of Newcastle has been married to Tom Kohler, a singer, at the Church of St. Vincent de Paul.

Madrid, April 8th.—The Cortes to-day adopted Article 14 of the Cuban Budget, providing for the liquidation of all debts owed by the Cuban Treasury, the liquidation accounts to be submitted to the Cortes.

St. Petersburg, April 8th.—Prince Orloff will soon return to Paris.

Paris, April 8th.—The Bishop of Angers has induced his diocesan the Archbishop of Tours, and the suffragan Bishops of the arch-diocese, to send a joint episcopal letter to President Grévy, protesting against the decrees relative to unauthorized religious congregations.

Paris, April 8th.—A despatch to Premier de Freycinet, from the French Consul at Singapore, reports that a Frenchman, on a mission to Sumatra, has been assassinated, with two companions.

Rome, April 8th.—The *Italie* says: The Lambertini-Antonelli case will come up again on the 30th instant. The Countess de Lambertini will bring witnesses to prove that the baptismal register, on the strength of which the Court of Cassation rejected her appeal, is false.

Cabul, April 8th.—Abdur Rahman Khan has reached Ghazi, on the road to Charikar. He has written to Kohistanis to join him, and already 3,000 irregulars have left in obedience to his order.

Berlin, April 8th.—The contemplated meeting between Emperor William and Queen Victoria will not take place, in consequence of events in England having tended to hasten the Queen's return.

Parnell, addressing the electors of Meath, said he would resign his seat for Cork City, and would never forsake Meath. He denied that he had offered the representation of Meath to O'Gorman.

The *Daily News* (Liberal) says: "There can be no doubt that the country has declared not only in favor of the Liberals, but for Gladstone for Chief of the Government. If the Queen does not send for Gladstone, the first thing Lord Granville or the Marquis of Hartington, or whoever receives the Royal Commission, must do, is to wait on Gladstone."

London, April 9th.—Parnell has received the freedom of the City of Cork for his services in behalf of Ireland.

Parnell stated that Right Hon. Col. Taylor (Conservative) who has been re-elected for Dublin county, will be raised to the Peerage, and Sir A. B. Guinness, who stood for Dublin City, will be the Conservative candidate, and the O'Connor Don, who stood for Roscommon, the Liberal candidate for the vacancy thus caused in Dublin county.

The *Times* estimates that the Liberals in the new House will number about 310, and the Home Rulers from 60 to 65. The Conservatives can hardly count on more than 250. The Liberals will thus find their position in the new Parliament nearly the same as that of the present Government in the late Parliament.

At a meeting of the Liberal Executive Committee, yesterday, a deputation was appointed to proceed to Havarden to urge Gladstone to consent to a public reception in London.

The Liberal net gain is now 97 seats.

A Cabinet Council will soon be held.

Madrid, April 9th.—Congress has approved the decree fixing the strength of the permanent army in Cuba at 40,000 men. Congress also limited the floating debt of Cuba to 6,000,000 piasters, except in the event of an emergency.

Berlin, April 9th.—In the Reichstag to-day debate began on the second reading of the Army bill. Stauffenberg proposed to restrict the term of the operation of the bill to three years. Rejected—130 to 104. The first and second paragraphs, fixing the peace strength of the Army, until March 31st, 1888, at 427,270 men, was adopted. Yeas, 186; nays, 96.

The Minister of War declared that the bill owed its origin, not only to the present political situation, but to reasons of a lasting character, and that a permanent military budget could alone give the army stability and confidence.

Rickert (National Liberal) said the strengthening of the army was of the highest importance to the nation, and must not be made a party question now. He declared that no party existed in Germany which wished to weaken the defensive power of the Fatherland, but it was the desire of the whole nation to uphold with a mighty hand the possessions which Germany had acquired, and to maintain peace.

Constantinople, April 9th.—An American citizen, accused of the murder of a Turk, was recently tried before Heep, Consul-General of the United States, found guilty of manslaughter, and sentenced to two months' imprisonment. Savas Pasha, Minister of Foreign Affairs, has protested against the right of the American Consul to try the

case, and demands the surrender of the prisoner to the Ottoman authorities. Heep declines to surrender him.

Lima, March 25th.—The corvette *Union* forced the blockade of Arica, after fighting seven hours with two Chilean iron-clads and a transport. She discharged her entire cargo while fighting, and has returned to Callao. The *Union* was undoubtedly sent from Callao, with arms and ammunition for the Peruvians in the blockaded port of Arica, probably under command of Captain Villavieja, and has succeeded in her errand, despite the Chilean blockading vessels. In the seven-hours' engagement, it is fair to presume that the *Union* was assisted by the monitor *Manco Capac* and the fortifications of Arica. Captain Villavieja has already distinguished himself as commander of the *Challaco*, by many successful trips with supplies for the Peruvian forces in the southern ports of the Republic, delivering all, despite every effort of the Chilean vessels to capture him.

Chicago, March 30th.—The *Journal's* New York special says: Notwithstanding the agreement between the President of the Argentine Republic and the Governor of Buenos Ayres, for reciprocal dismissal of their respective forces, a collision occurred on the 22d ult. between citizens and national troops, and eleven of the former were murdered with bayonets.

Such was the heat during the march of the national soldiery in review, on the 22d, that, the men not having received their summer clothing, 200 fell down on the road and six died.

Dublin, March 30th.—The Home Rule League passed a resolution declaring the treatment of Parnell, at Ennisceorthy, by a hired mob, reflects the deepest disgrace on O'Clery and all concerned in the outrage.

St. Petersburg, March 30th.—The health of the Czarina is declining. All reports of an early departure of the court to Livadia are unfounded.

Paris, March 30th.—The health of the city continues below the average; there were 1,206 deaths last week. Typhoid fever and smallpox are prevalent.

Telheran, March 30th.—At Telikislar and at Chatm, the preparations of the Russians for the campaign are singularly backward; their entire force is only two thousand.

New York, March 30th.—Dispatches from London state that the English Catholic aristocracy will provide an asylum for Jesuits who may be expelled from France.

Paris, March 30th.—Decrees against unauthorized religious societies will be published immediately. The first concerns the Jesuits only, while the second affects all unauthorized congregations. The first decree says: The government, considering that further tolerance cannot be extended to a society against which the national sentiment has declared itself, have resolved to dissolve the association, and the establishments occupied by its members must be closed and vacated within three months, which period may be prolonged until August 31st, in the case of the educational establishments attached to the society.

London, March 30th.—James Gordon Bennett's *Muscodin* won to-day's Park hurdle handicap plate, *Red Hazard* second, *Peroration* third; five starters.

Madrid, March 30th.—The rivers Júcar and Segura and their tributaries have overflowed, and the towns of Alciara and Orihuela have been inundated.

London, March 31st.—At Coal Island, county Tyrone, a party of Orangemen entered the town and were attacked by a crowd of Catholics. The police interfered and were obliged to fire, wounding two of the attacking party.

London, March 31st.—Newman Hall, who in August last obtained a divorce, has married the lady to whom he admitted during the trial he had communicated his intention to marry, in the event of the success of the suit against his wife.

Vienna, March 31st.—A secret printing office has been discovered in Warsaw, and several persons, all Russians, arrested.

Alexandria, March 31st.—The lighter to convey Cleopatra's needle to New York, is being towed into this port.

Copenhagen, March 31st.—The Criminal Court has sentenced Baron Godalea Chief of the banking house of Godalea & Co., diplomatic agents of the Bay of Tunis, late Consul General to Portugal and possessor of a dozen grand crosses and other decorations, to one month's im-

prisonment for repeatedly using cancelled stamps on stocks and bills.

Panama, March 31st.—The *Star and Herald* says the Chilians are reported to have met with disaster near Moquega. The Minister of War, wishing to surprise the Peruvians, marched under cover of night to attack. He fell into an ambush, and of one regiment of 1,200 men only 67 escaped. It is reported that the Chilian loss was 1,300 killed, besides wounded and prisoners.

The *Huascar* and *Magellanes*, in the attack on Arica, lost 25 men, killed and wounded, among the former Commander Thompson, of the *Huascar*, and two other officers. The *Manco Capac*, carrying American guns, struck the *Huascar* ten times, carrying away her mizzen-mast and seriously damaging her hull. While the *Manco Capac* and shore batteries were uninjured, many houses in town were knocked down, and several women and children killed.

The Chilians had not given notice of their intention to shell the town. Two Chilian war vessels visited Lonerós, Gnano Islands, and stopped the loading of about 20 vessels.

London, April 1st.—The Envoy of the King of Siam is expected on his second visit to England by the middle of May. It had been arranged that the King himself would come and invest Queen Victoria with the Order of the White Elephant, but his visit is postponed in consequence of the indisposition of the ex-Regent, who would in the King's absence have had the reins of government.

London, April 1st.—The Surrey open steeple chase was won by *Bacchus*; *Muscadin* second, *Hopbloom* third. Five started.

London, April 1st.—Lord Rivers is dead.

St. Petersburg, April 1st.—No special correspondents will be allowed to accompany the Turcoman expedition.

St. Petersburg, April 1st.—General Melikoff is hastening the political trials. Many Nihilists have been placed under police supervision, and others exiled to Siberia.

St. Petersburg, April 1st.—Russia has received favorable answers from the Powers to the circular proposing limitation of the right of asylum in Germany.

Berlin, April 1st.—Migration to the United States is again on the increase, and extensive preparations therefor are being made in every part of Germany.

Paris, April 1st.—Desprez, French Ambassador to the Vatican, has delivered his credentials to the Pope, in State.

Paris, April 1st.—Telsseirenebort has tendered his resignation of the Vienna Embassy, on account of ill-health.

Constantinople, April 1st.—The delay in regard to the sentence of the assassin of the Russian Colonel, Commeroff, causes indignation. The Russian representative threatens to quit Constantinople if justice is not speedily done.

Madrid, April 1st.—The Government has signified its intention to discuss the Cuban estimates before taking up the Imperial budget, as the situation of the treasury in that colony requires prompt measures. The Government during March provided the Captain-General with \$9,000,000 for suppressing the insurrection. Every shade of opposition in the Cortes is anxiously watching Cuban affairs.

Havana, April 1st.—Drouth has prevailed here over three months in the most fertile portions of Cuba, and has done immense damage. The tobacco crop in Vuello Abajo is almost destroyed, and plantations are unusually exposed to fire. Luckily, fires have been comparatively few. It is estimated the total sugar crop will not exceed 400,000 tons.

The insurrection in the east of the island languishes, but robbery and vagrancy increase fearfully.

Mons, April 1st.—An explosion of fire damp occurred yesterday in a colliery at Anderlues. The number of lives lost is unknown, but twenty corpses have already been recovered. There were 150 persons in the pit at the time of the disaster.

Paris, April 1st.—A circular signed by Duclerc has been sent to all members of the Senate and the Chamber of Deputies, setting forth a project for the construction of a maritime canal between Bordeaux and Narbonne, thus connecting the Atlantic with the Mediterranean. Duclerc urges the military economy and commercial advantages of such a canal, and concludes with an appeal to the Government to undertake the work, or at least aid in its execution. The scheme has already been examined by a private company.

Madrid, April 1st.—General Lucas Fairchild, United

States Minister, presented his credentials to King Alfonso yesterday. General Fairchild expressed the friendly feelings of America toward Spain, and the King replied in a similar spirit.

Paris, April 2nd.—Premier de Freycinet declares that General Chanzy, French Ambassador to Russia, intended to return to France to preside at the sittings of the Council of Arceves, and would probably return to St. Petersburg afterwards, it being anticipated that by that time a new Russian Ambassador would have arrived in Paris.

Athens, April 2nd.—King George has warmly thanked Charles Tuckerman, formerly United States Minister here, for his paper on the Greek frontier question, which he prepared some time ago for the consideration of the mixed Commission.

Paris, April 3rd.—By a colliery explosion at Anderlues, forty-two persons were killed. Forty-four persons in the pit escaped.

London, April 3rd.—The poll for London University opened on the 31st ult., and will remain open until the 5th inst. Voting is *vice voce*. Up to noon to-day, Robert Lowe (Liberal), Chancellor of the Exchequer in Gladstone's Government, received 957 votes, and A. Charles, 494.

London, April 3rd.—The defeat at York City of James Lowther (Conservative), Chief Secretary for Ireland, was received with wild delight by the Home-Rulers and Nationalists in Ireland. Sir John Lubbock (Liberal), defeated at Maudstone, will probably stand for Radnor District in the event of the Marquis of Hartington (Liberal) being successful in north-east Lancashire, the latter having been elected for Radnor District and not for Lancashire, as previously announced.

London, April 3rd.—The *Saturday Review* (Independent) says: Constituencies could not have given a much more decided answer to Lord Beaconsfield's appeal; but why they have given it, nobody can exactly say. Very probably many electors were tired of the Government merely because it had been six years in office; but there are some things the elections have placed beyond a contest. They show that the Republicans have not exercised the influence it was expected they would; that the Liberals were not divided by crotchets; that their party organization is much improved, and that the moderates have, as a rule, neither abstained nor gone over, but have voted with their party.

The *Spectator* (Liberal) says: Nothing surprises people more in the elections than the evidence they give of how easy it is to live in England and not know anything about the real opinion of England. Wherever you went you were told that that whatever Scotchmen or Irishmen might think, England would support Beaconsfield's policy with enthusiasm.

In an article on the consequences of the Liberal victory, the *Spectator* says: It is a severe blow to Tory-Democracy. No other man will ever wave the banner of prestige, as Lord Beaconsfield has done, without striking a stroke for it. In the second place, we are rid of personal government. It is, however, in its effects abroad, that the Liberal victory will be most far-reaching. We do not believe there will be joy at St. Petersburg at all. Russia dreads and distrusts certain views of Liberal chiefs, especially Gladstone's, far more than she dreads the Ministry which can be coerced into secret compacts; but millions of Greeks, Armenians and Bulgarians will rejoice at the prospect of the new career made possible to them, and their rejoicings will be feeble compared with the exultation of our millions in India, no longer taxed to death in order that the Premier may pose as arbiter of the destinies of Central Asia. England can hear with equanimity that Bismarck is sorrowful and Baron Haymerle worried, if throughout the world all freemen will feel as if with the Tory Democratic Government of England a miasmatic cloud had been rolled away.

The *Times* says: After Gladstone's defeat in 1874, he not only resigned the leadership of the Liberals, but declared his intention of withdrawing, so far as possible, from active political life, and a logical consequence of this resolution would be that he would not take office in the coming administration; but this resolution has already been in spirit very conspicuously infringed, and it cannot be doubted that a very strong pressure will be brought to bear upon him in order to induce him to abandon it. But

nobody can doubt that Gladstone is the most potent force on the Liberal side; but for him, there is no sign that the policy of the Government would have been so vehemently challenged. It is Gladstone who has led and inspired the assault which has now been so conspicuously successful, and he must be regarded as representing the views of the class of voters to whom the Liberal majorities are due. The same article points to the remarks of Gladstone at West Calder yesterday, to the effect, "That he neither directly or indirectly insinuated to any one that he had come there as the chief of the party, or that a return to office at his time of life was his desire." The *Times* says: "This is a very different thing from refusing to accept the responsibility naturally attaching to the course he has recently pursued, and it is therefore scarcely conceivable that Gladstone, while remaining in public life, will not become a member of the new Cabinet. The *Times* editorially to-day, regarding the Liberal Government as a matter of course, discusses the consequent political prospects and thinks Gladstone is certain to take office."

Chicago, April 3rd.—A London special has the following announcement of the result thus far of the elections in England: Paris newspapers, *La France*, *Rappel* and *Liberty*, exult over the defeat of the Conservatives. German newspapers view Gladstone's government with apprehension, while Austrian and Turkish journals are astonished at the result. The opinion prevails in Berlin and Vienna that England will be isolated if Gladstone becomes Chief of the Cabinet.

Berlin, April 3rd.—The universal belief in Germany is, that the peace of Europe would be much more assured under a Tory than under a Whig Government.

London, April 3rd.—Parnell has abandoned his intention to revisit Emmet's tomb next Sunday, and has arrived at Cork, where he will remain until the elections are decided.

London, April 4th.—An election meeting was held yesterday near Ossoria, in County Carlow, to support the candidature of Gray, Lord Mayor of Dublin, who in a speech stated, that parcels of dynamite were found under the platform on which he then stood, to blow up those wishing to vindicate the rights of Irishmen.

London, April 4th.—The *Times*, in its leading article this morning, says: We do not hesitate to predict that when the Liberal Government comes into power, its policy respecting the external relations of the Empire will be precisely coincident with the counsels we urged upon the Beaconsfield Ministry. The *Times*, has advised satisfaction of the claims of Greece, guarantees for the better government of Christians in Armenia and other parts of Asiatic Turkey, and withdrawal from Afghanistan as soon as a strong frontier is assured and peace restored in Cabul.

London, April 4th.—The *Observer* this morning says: We understand that there will be no decision as to whether the Government shall resign at once or await an adverse vote of Parliament until the exact number of the Liberal majority is ascertained. After the result of the polling on Friday became known a special messenger was sent to Baden-Baden with dispatches for the Queen. We have reason to believe that Gladstone disapproves of the arrangement suggested in various quarters, that he accepts a subordinate office in the new Administration. He still adheres to his intention of not resuming office, but will cordially support the recognized Liberal leaders, Earl Granville and the Marquis of Hartington. There has been no consultation between the Liberal leaders on the subject of a Ministry.

London, April 4th.—Dr. Kenealy, who was defeated at Stoke-upon-Trent on Friday, was at the bottom of the poll.

Bombay, April 4th.—In consequence of the result of the British elections, the departure of the Viceroy from Calcutta for Simla has been postponed.

Cabul, April 4th.—Mahomed Jan has attacked 250 Hazaras near Jyusener. The Hazaras killed Mahomed Jan and two other Chiefs. Hard fighting followed, ending in the total defeat of the Afghans.

London, April 4th.—A *Times* Cabul dispatch says: There is reasonable hope that, in the next few weeks, there will be a satisfactory settlement and peaceful return of our troops to India.

Paris, April 4th.—*Le Temps* says: A note from the Vatican to the Government is on its way to Paris, expressing regret at the measures against the Jesuits, but

abstaining from any formal protest and from anything resembling encouragement to religious confraternities to resist the decrees of the Government.

Paris, April 4th.—The *Moniteur* and *Gazette de France* announce that at a meeting of superiors of unauthorized religious confraternities on Friday, it was decided neither to communicate their status to the Government nor to demand authorization, but to stand upon their common-law right.

Paris, April 4th.—The operations of the decree against unauthorized congregations have been extended to the Colonies. The Jesuits have establishments in the islands of Bourbon and Madagascar.

Paris, April 4th.—A terrible fire has occurred in Montaimont, a village of Savoy; seventeen inhabitants perished, and thirty-one dwellings were destroyed.

Constantinople, April 4th.—There is great excitement and delight here at the result of the elections in Great Britain, especially among Greeks.

Berlin, April 4th.—It is announced that the Czar will not visit any German watering places this Summer, as usual.

St. Petersburg, April 4th.—General Melikoff's position is already shaken.

St. Petersburg, April 4th.—The *Vidomosti* says: A considerable amount of gunpowder has been stolen from the Government powder mills at Odessa.

Berlin, April 6th.—News is received from St. Petersburg that the Chinese Chargé d'Affaires is making preparations for returning home with his entire staff.

Berlin, April 6th.—Prince Renss, German Ambassador to Vienna, is here on a furlough, from which it is inferred that negotiations with the Vatican are progressing speedily.

Rome, April 6th.—There is no truth in the report that the Vatican has dispatched a note to the French Government regretting the decrees against the Jesuits.

Rangoon, April 6th.—The British Commissioner has written a letter to the Burmese Embassy at Thyetmyo, saying that the Embassy had failed to offer satisfactory proposals for a new treaty with Great Britain. Therefore an early return of the Embassy to Upper Burma was desirable.

London, April 6th.—Advices from Cape Town dated April 5th, say: The Peace Preservation Act was to-day proclaimed in Basutoland. This was probably done in connection with the disarmament of the natives, from whom trouble was apprehended.

St. Petersburg, April 9th.—The *Agence Russe* declares that China has not been instigated by any foreign power to assume an attitude hostile to Russia, and that it would be premature to apprehend serious complications relative to the Kuldja question, as the nature of the Chinese proposal is unknown. Russia is not accustomed to regard a treaty which has been concluded as not existent, and if negotiations become necessary they will be carried on under conditions better calculated to secure the execution of the treaty.

## THE JAPANESE PRESS.

### THE CAUSE OF THE PRESENT CRISIS.

(Translated from the *Mainichi Shimbun*.)

What has brought Japan to its present unsatisfactory condition? It is not war, because we know that the Government has always been anxious to pursue a peaceful course. Thus we find that, in the management of the affair with Corea, if one false step had been made, the coast of that country would have been ravaged by our forces, but the Government wisely determined to adhere to a pacific policy. Soon after His Majesty the Emperor ascended the throne he issued a proclamation that steps were to be taken towards the gradual establishment of a constitutional form of government, so that perfect harmony might always be preserved between the Sovereign and the people. We also are aware that the Ministers are sedulously employed in maintaining peaceful relations with all nations, and although some of their acts created dissatisfaction in the community, still no dissensions occurred among the Ministers themselves, and those who held warlike views quietly retired from the cabinet. Then the negotiations with Corea were brought to a successful termination, and the

inhabitants of that country were introduced for the first time to the benefits of civilization. Again, a similar policy was pursued in the case of the Formosan affair, and it is therefore evident that the present position of the country is not due to any warlike tendencies of the Government.

Are we then to attribute the misfortunes of Japan to a want of ability in the Sovereign and ignorance in the Ministers? Certainly not. What then is the cause? Our reply is:—The fall in the value of the paper currency.

When the paper currency of a country seriously declines in public estimation, confidence is lost and the people disquieted. The prices of all commodities rise: it becomes more and more difficult to obtain a livelihood, and, as matters get worse, riots and outbreaks occur in different localities. The result frequently witnessed is the sweeping away of the Government.

Having carefully watched the fluctuations in kinsatsu we noticed that, while the discount was about thirty per cent, it was not looked upon as anything very remarkable. A considerable time then elapsed before kinsatsu fell to forty per cent discount, but once that rate was reached the downward course was extremely rapid until the disastrous discount of sixty per cent was arrived at. In consequence, trade in the open ports became very dull,—in fact at a standstill,—and not only Japanese, but foreigners also, suffered severely. No doubt the authorities were greatly grieved at this state of things, and tried to remedy matters by forbidding speculation in kinsatsu and specie. We cannot see that, so far, any good has resulted from the government measures. kinsatsu are still practically at about sixty per cent discount; and, if any trader wishes to purchase specie, he has to submit to a still greater loss. Hence business people are placed at unwonted disadvantage.

The revenue of Japan is something over fifty million yen; and the value of paper money, as compared with specie, is as 10 to 16. Now, let us suppose that the yearly income of the country is fifty million yen, and that the discount of one paper yen is fifty sen as against specie. If the revenue was paid in specie, the Government would receive the whole fifty million yen without abatement, but as the authorities themselves either issued, or permitted the issue of, paper money, and made it the currency of the country, they cannot consistently insist upon payment in specie, and therefore have to content themselves with kinsatsu. Thus, assuming that the revenue is paid in paper, the income of the Government for the current year of Meiji (1880) will be equivalent to only thirty-three million in silver yen. This is very plain; because the difference between specie and paper is as 100 to 150, i.e. one-third discount, which on a total of fifty million paper yen would involve a loss of some fifteen or sixteen million. Before the disastrous fall in the value of kinsatsu, the Government complained that the revenue was not sufficient to meet the expenditure, and now they have only a reduced income of some thirty millions. If the fall in kinsatsu was not accompanied by a general rise in prices, the authorities might, perhaps, find no difficulty in making both ends meet, but the two circumstances are inseparable. How then are the Government going to manage? Will they impose fresh taxation to make good the deficiency? This cannot be done. The farming population have already frequently risen against the present taxes and the people in general will never submit to increased burdens. If the authorities attempt to make good the deficiency by the issue of more paper money, the depreciation will only become greater; and, although commercial pursuits will suffer grievous injury, the Government will ultimately be by far the most considerable sufferers.

Suppose that a man undertakes to complete a certain piece of work within three years, at the price of one hundred yen in kinsatsu. Before the expiration of the contract it may be that, through depreciation of currency and rise in wages and material, the work has cost the contractor one hundred and twenty yen when finished. Thus, instead of gaining, he incurs heavy loss, and we consider that it is the fear of such consequences that has discouraged trade. The depreciation of the paper currency is directly responsible for the financial embarrassments of the State and the stagnation in trade. Therefore we are constrained to the conclusion that the present difficulties of Japan are not owing to want of

ability of either the Sovereign or his Ministers, but simply to the enormous fall in the purchasing power of kinsatsu.

Our readers will doubtless remember that on a previous occasion we mentioned that, notwithstanding the fact that the Government of the United States retained—and justly so—perfect confidence in the paper currency of the country, President Hayes remarked, in his message at the opening of Congress, “the withdrawal of the paper currency now in circulation is very essential, and it is only by doing so that we can ensure the stability of our financial system.” Here in Japan the paper money has for a considerable time lost the confidence of the public, and, if the Government only strive to lower the price of commodities and do not withdraw the kinsatsu from circulation, their action will be similar to that of a physician who prescribes for a patient without ascertaining the cause of his illness. Let us now consider what course should be adopted to cure the financial sickness from which Japan is now suffering.

Nothing is more necessary for the tranquillity of a nation than a proper administration of its finances. Tyrannical rulers may mismanage the general administration and thus lose popularity; but, so long as their muddling does not affect the finances, the people do not make any active opposition. Perceiving this, the despotic ruler engages in foreign wars, incurs enormous expenses, and ultimately is forced to levy heavy taxes upon the nation and to issue paper money. There is, of course, a limit to the quantity of specie in every country; and, after a time, paper money begins to depreciate. The greater the issue of paper the greater is the lack of confidence in it, and as confidence decreases, so does depreciation increase. Thus, in the example which we have given, the action of the Government is responsible for all the injury, while the people suffer all the loss. The Government do not regard the public with enmity, but the public looks upon the Government in that light, and history furnishes abundant examples how this has led to the overthrow of many administrations. Here, in Japan, although the actual course of events has not been the same, still the result is unhappily precisely similar to that experienced by the needy states of olden times. Our national indebtedness has not been caused by mismanagement, but yet the unanswerable fact remains that the paper currency is to specie, in value, as 10 is to 16. If some remedy for this lamentable condition of affairs is not quickly brought about the result must be national bankruptcy.

In the Finance Minister's estimates for the 12th year of Meiji, we find the foreign and domestic debts divided into nine different classes, viz:—the new domestic loan of 11,327,670 yen; the domestic loan for the reduction of paper money 1,923,700 yen; the domestic loan for capitalized pensions, 14,168,900 yen; the loan for pensions, 173,287,530 yen; the loan for the pensions of the old Shinto priests, 423,320 yen; the loan for the encouragement of industries, 12,500,000 yen; the loan for the expenses incurred in the suppression of the rebellion, 15,000,000 yen; the old foreign loan, 1,464,000 yen; the new foreign loan, 10,865,120 yen; thus the total of the foreign debts amounts to 11,829,120 yen, and the domestic debts, including 113,427,992 yen of paper money in circulation, to 363,827,970 yen. The whole of this indebtedness has been created by the Japanese Government since the restoration.

Let us now consider how the national debt has arisen. After the restoration, and the accession to power of the present Government, the finances of the State were undeniably in a very confused condition. The Government then incurred a heavy outlay for the expedition to the northern provinces. They assumed the liabilities of the clans and princes, and also issued bonds for the support of the nobles and gentry. A loan was also raised for the construction of railways and the encouragement of industries. Thus we find that the national debt has almost entirely arisen from natural causes, and not, as in many other countries, from the unjustifiable proceedings of irresponsible rulers, who first create unnecessary wants, and then plunge the nation into debt to satisfy them. However, whether the present financial position has been caused legitimately or otherwise, the practical result is in no whit different, and it is therefore impossible for those who interest themselves in questions of financial policy to pass over the matter in silence.

It appears to us that the Government should lay down three rules to extricate the nation from its present difficul-

ties. These are: 1st.—There shall be the same amount of specie in circulation as paper, and the latter shall be freely exchanged for the former. 2nd.—The Finance Department shall from time to time redeem a portion of the paper currency with the reserves of specie, such redeemed paper to be at once destroyed. 3rd.—All paper money of the value of one yen and under to be called in and specie issued in lieu of it. It is plain that, owing to the circumstances of the country, the first rule cannot be enforced at present, therefore we must rely upon the second and third rules to remedy the present disastrous state of the finances. It is of course absurd to imagine that the evil can be rectified immediately; it will inevitably be a work of time; but, for all that, steps should be taken to mitigate the existing distress.

According to a notification issued in October, 1879, the bank-notes in circulation then represented 33,104,730 yen. In the estimates for the same year the specie reserve fund was stated to be 1,500,000 yen, and the fund provided during the same year, to be applied in reduction of the national liabilities, was estimated at 50,898,000 yen. Then again the Government had made advances of 7,495,220 yen to different individuals for the encouragement of industries. This sum cannot, of course, be made immediately available, but still it is an asset; and if we add these advances to the sinking fund we have, in round figures, 60,000,000 yen. If to the paper currency of 113,498,000 yen, we add the bank-note circulation of 33,000,000 yen, we find the total liabilities some 140,000,000 yen. Thus, the Government assets are, compared with the liabilities, as five is to ten or ten to twenty. It is ridiculous to suppose that five can be made to do duty for ten; but, as the value of a paper currency is measured by the confidence the people repose in it, therefore, it may well be that a reserve of specie equal to half the paper in circulation will be amply sufficient to maintain the value of kinsatsu.

Paper money bears the same relation to specie that a shadow does to its substance. If the substance is small so will the shadow be also. If the Government has not a sufficient supply of specie, the paper currency can never command the confidence of the nation. This proposition is self-evident and requires no demonstration. If we are asked which is the more convenient, specie or paper, we are forced to admit that the latter is preferable as far as regards portability. Thus we find in every commercial country a paper currency. In England, notes, bills of exchange and cheques, are all used to represent specie. Coin being inconvenient to carry about, those forms of representing it were introduced, and it follows that, if we in Japan wish to facilitate mercantile transactions, we also must supply traders with a paper currency. We know, as a matter of fact, that when the notes issued by the American Government depreciated in value, the authorities of that country wished to exchange specie for them, and thus withdraw the notes from circulation. What was the result? Quite unexpectedly only comparatively few people applied for specie, and the Government had to abandon the idea of withdrawing the paper from circulation. As we have seen, the reserve funds of the Government, according to the estimate and including advances, are about 60,000,000 yen. Now, if the authorities will devote these funds to buying up kinsatsu, either in large or even small quantities, so as to reduce the circulation, and also insist upon a diminution of the notes issued by the banks, then, although our financial position may not be immediately improved, yet it is not difficult to see that ere long the measure would bear good fruit, because the present depreciation of kinsatsu is undoubtedly due to over issue.

The banking laws provide that any one establishing a national bank must deposit four-fifths of the capital in government loan bonds, which bear interest at four per cent. For example, a person establishing one of these banks with a capital of 100,000 yen, deposits 80,000 yen in loan bonds. The Government then manufactures 80,000 yen in bank notes and hand them over to the banker, who has in addition 20,000 yen in paper as a reserve. Then, if any of the banker's bonds are subsequently drawn for redemption, he receives their value and has to purchase other bonds in the market to the same amount, and deposit those bonds with the authorities in lieu of the bonds so redeemed. Thus a portion of the Government liabilities is always decreasing, but no such reduction takes place in the bank notes in cir-

culation. This is another cause of the depreciation in kinsatsu. In fact, the primary object of the existing Banking Regulations is the reduction of the loan bonds, while the diminution of the paper currency is treated as a matter of secondary importance.

The large issue of bonds affects the bonds first and the kinsatsu afterwards. Our present difficulties arise from the over-issue of paper, not from the bonds; therefore, the true remedy is a reduction of the kinsatsu in circulation first, and of the bonds afterwards.

How then is this to be accomplished?

We answer:—The laws affecting banking must be revised, in order to compel a reduction in the issue of bank notes. Instead of the existing regulation providing for the continuous deposit of loan bonds to the extent of four-fifths of the capital, we would suggest that, when a banker's loan bonds are redeemed, he shall deposit an equivalent in bank notes. These notes the Government should at once destroy. Thus the banks would carry on business with Government kinsatsu and their own note issue would become gradually contracted. This measure would probably have no immediate result, because the number of bonds redeemed in any one year is limited, and the bonds are held all through the community and not by bankers only. However it is much more desirable to diminish the paper currency than the bonds, and every effort to do so is a step in the right direction.

As we have already mentioned, the notes in circulation amount to 33,104,730 yen. If our idea is adopted, the loan bonds will be reduced every time the lots are drawn, and at the same time, the bank notes which cause the depreciation of kinsatsu will gradually disappear from circulation. Again, if the reserve funds are applied in the purchase of kinsatsu, although no immediate result may be apparent, still the downward tendency will be checked and confidence restored.

We believe that there would not be much difficulty in carrying out our suggestion; but, if it be thought impracticable, then adopt the third course and replace with specie all paper money of the value of one yen and under.

Kinsatsu representing two yen and over aggregate a very large sum. The small denominations are more continually in use, and although a great many people approve of them there are numbers who do not. It would not be hard to withdraw these small notes from circulation, leaving the larger ones to be dealt with subsequently. Let us begin with an easy task, leaving the difficult one for after consideration. It cannot be denied that, if these notes of small value were replaced with specie, the confidence of the people in the paper currency would be vastly increased.

The three suggestions we have made are, in our opinion, the only means of dealing with the present crisis. The first suggestion is not practicable just now, and therefore we have only the second and third to fall back upon. Even if one or both of these is put into operation we are not sanguine of any immediate result, although we entertain no doubt that the end desired will be produced in course of time. Thus the disastrous condition of the finances of the Empire will be effectually remedied, and a recurrence of the existing calamitous position rendered impossible.

#### LAW REPORTS.

##### IN H. B. M.'s COURT FOR JAPAN.

(Criminal Sessions.)

Before R. T. KENNIE, Esq., Judge.

Friday, the 7th day of May, 1880.

Mañl, a Malay seaman of the P. & O. Company's steamer *Sunda*, was indicted for stabbing Katchung, also a seaman on board the *Sunda*, with intent to do him grievous bodily harm.

The following gentlemen were empanelled as a jury:—Messrs J. B. Maxwell, A. J. Macpherson, H. A. Towse, W. Howard, and A. Clark.

Mr. J. J. Enslie, the Acting Crown prosecutor, conducted the prosecution. The prisoner, who pleaded *not guilty*, was undefended.

Mr. H. A. Crane having been sworn as interpreter, Mr. Enslie briefly opened the case and called

Katchung who, warned to speak the truth, said:—On the 18th of April last, I was in a Japanese house with the

prisoner and another seaman, called Cassim. It was about ten o'clock at night and we were taking our supper. The prisoner began to quarrel with Cassim, whom he attempted to stab. Cassim got hold of the hand in which the prisoner held the knife, and succeeded in making his escape. The prisoner then turned toward me and stabbed me. I had given no provocation to the prisoner. I had been drinking before, but we were then all right. I was sitting quietly at my meal when he stabbed me in the back. I do not know if prisoner was intoxicated at the time.

Cross-examined by the prisoner: I was not intoxicated when you stabbed me. I had not been quarrelling with you, but I had had a fight with a European during the day.

To a Juror: The knife was the property of the prisoner. I saw him draw it. It was a table-knife with a white handle. I had been drunk about an hour before.

By the Court: I had had no previous quarrel with prisoner.

Ed. Wheeler, M. D., sworn: I know the witness Katchung. I saw him on board the P. & O. S. S. *Malacca* or *Sunda* on the 19th of April. I found him with his arm in a sling, and an incised wound in the right side of the back, a little below the scapula. The wound had been inflicted with a knife. The cavity of the chest had not been opened, as the knife had evidently glanced off a rib. I had him brought up to the hospital, that afternoon, for treatment, and he remained there until the end of the month. The wound had evidently been inflicted either with a sheath-knife or a large clasp knife.

To a Juror: The wound might have been inflicted with a table-knife if used with sufficient force; the direction of the wound was downwards and not in an oblique direction.

Cassim, a native of Singapore, seaman on board the P. & O. Company's steamer *Sunda*, stated: On a Sunday, about 11 o'clock at night, seventeen or nineteen days ago, the prisoner attempted to stab me in a house in Yokohama, belonging to a Chinaman, but at present occupied by a Japanese. When prisoner attempted to stab me, I held his arm for a little while, but as his knife cut me I let him go, and then he stabbed Katchung in the back with a knife; I do not know where he got it from; I only saw it in his hand. I cannot say why prisoner stabbed Katchung; there had been no quarrelling. Katchung had been intoxicated but had become sober. I was slightly intoxicated, but can remember all that happened on that occasion.

Cross-examined by prisoner: I was not very drunk, and I went out to call the police.

To a Juror: There had been no quarrelling before, and I cannot give any reason for prisoner attempting to stab me. We were not using any knives in eating. It was just after the meal that the stabbing occurred. The knife was a table knife with a white handle.

Prisoner said that he had no witnesses to produce. In a statement, through the interpreter, he said that he had an ill-feeling against Cassim for certain things he had taken from him, and he intended to strike him, but when Cassim returned the things, he gave up the idea. He had a knife but it was a clasp-knife. He had no wish to use a knife at all.

His Honor summed up; and after a short deliberation the jury returned a verdict of *guilty*.

The prisoner was sentenced to six months' imprisonment with hard labour.

#### IN THE IMPERIAL GERMAN CONSULAR COURT.

Before E. ZAPPE, Esq., Consul.

Friday, the 7th day of May, 1880.

H. COOK vs. W. H. HOHNHOLZ.

This was a claim for the recovery of \$98.20, balance due for repairs done to the German schooner *Lottie*, and \$142.60 for work done to a yacht belonging to the defendant.

Defendant declared that the prices mentioned in the two bills produced were too high; he admitted to be indebted to plaintiff, but disputed the amount. The bill regarding the schooner *Lottie* had been presented to him before; he had paid \$25 on account of it, and had told plaintiff's clerk when he came to collect the money that he would see Mr. Cook and come to an arrangement. As to the bill regarding the schooner, he had not seen it before he came into Court.

Plaintiff contended that both bills were made out on the 17th of December, 1879, and presented the same day to defendant.

His Honour asked the parties if they could not come to an agreement out of Court, as he had suggested to them at the first hearing of the case.

Mr. Hohnholz replied that he had offered \$100 to satisfy the claim, but that plaintiff had refused; he was now willing to pay \$125, but this offer too was refused.

Defendant asked to be allowed to prove that both bills had been sent to defendant on the 17th of December, 1879, for the first time, and then several times afterwards, and called as witness—

S. Severin, who, being sworn, stated: I am a book-keeper in the employ of plaintiff. I made out the bills on the 17th of December, 1879; the date is marked on them; I wrote them at that time because I was making up the yearly accounts. They are copies of the entries in the ledger. The same day I presented them to Mr. Hohnholz, who said that he would settle; later I went several times to Mr. Hohnholz, asking for payment; he usually answered me that he was very busy, that he could not settle. He never objected to the amounts charged in the bills; but the last time when I was at his place he said that the prices were too high, and that he would see Mr. Cook about the matter. The letter produced in Court, dated December 19th, 1879, and written by defendant, is a reply to a note I had written him the previous day, requesting payment.

Defendant denied the correctness of this evidence, and handed to the Court a document showing that on the account for the repairs done to the yacht there are charged \$78 for 1,085 square feet of timber, while in fact only about half of that quantity had been used, further that it was impossible that a carpenter could have been ninety days at work, and that the price for copper paint is marked at \$6.50 per tin, while its real value is scarcely more than \$3.50; he therefore requested the Court to nominate experts to examine the work done on board.

Plaintiff, in reply to questions put by His Honour, remarked that the timber had been taken from his yard, and an account of it was kept by his foreman, a Japanese carpenter, in whom he had full confidence; as to the carpenter employed to do the work, he had been paid by his foreman. He, plaintiff, would not undertake the work on his own contract, and had only furnished a workman at Mr. Hohnholz's request; the man was to be paid by Mr. Hohnholz himself, who had done so for a while but then discontinued it, and the foreman paid the wages to the carpenter. Plaintiff did not know that this was done, until after the wages had already been paid for several weeks. He declared that he was quite sure that the amount of timber charged was used, and the wages mentioned in the bill paid to the carpenter. As to the price of the paint, it could not be considered too high, as he had on several occasions paid as much as \$7 for a tin. In conclusion, he expressed his readiness to see the matter referred to experts.

His Honour observed to the parties that the settling of the dispute by experts might become a difficult and expensive affair, as it might happen that the yacht would have to be pulled to pieces in order to ascertain how much wood had been employed for her repair, and that the losing party would have to pay the costs of her rebuilding. He therefore advised the parties to settle the matter among themselves.

Plaintiff refusing to enter upon any arrangement, His Honour declared that Mr. N. Bogel, ship-carpenter, residing at Tokio, should be called for to ascertain what had in reality been done to the yacht; as to the price of the paint, the opinion of Messrs. Langfeldt & Mayers should be taken. As to the sum of \$98.29 due for repairs done to the schooner *Lottie*, defendant was ordered to pay it at once to plaintiff, as he ought to have made an agreement about the prices to be charged before ordering the work to be done.

#### THE MAJOR'S MISTAKE.

##### CHAPTER I.

"Daah it, I'll save her life!" said the Major, suddenly. The Major had just laid a covering of snow-white lather on that tract of chin which was still sacred from the incursions of his luxuriant beard. As he gave vent to this remarkable resolution, he inadvertently wounded himself with his razor, so as to compel a resort to a towel and cold sponging, which put an end to his reflections for a time.

Major Marjoribanks was an active, cleanly-built man, rather below the average height. He had an eye like a hawk's, beautiful hair and whiskers, and no other striking feature. His hands and feet were small and finely-formed, and a front tooth, which Nature had taken from him, had been exquisitely supplied by the hand of Art.

The great feature of the Major's character was determination: when he said a thing he meant it. In the Crimea, if Major Marjoribanks had said that a post should be carried, its fall was looked upon as certain. Zerlino, the Major's vicious little mare, knew it was useless to try and refuse if once her master put her head straight for an obstacle. Like the late Mr. Asheton Smith, he would quietly "ride for a fall," if the leap were impracticable without one; and no one knew how to fall deftly better than the Major.

But a life spent, as it were, in a succession of pitched battles, does not pass without leaving marks of wear and tear, and the Major after his third bottle of hair dye, began to take very serious views of life. Short and decisive were his ruminations, and with characteristic promptness he determined on marriage as his next achievement. For this purpose he selected a young lady of remarkable wealth and considerable personal attractions, and devoted himself to the sacrifice like a second Iphigenia,—barring the sex.

Perhaps it was the very difficulty of the achievement that impelled the dauntless Major to the attack. Diana Harford had already refused two baronets, a banker, and four minor deities, before the Major's appearance in the field, and still continued to ride across country with as much enthusiasm as if her whole life was to be devoted to that occupation. People began to say that she would never marry: "The right man had not spoken," was the general opinion; and the Major, as he gnawed his moustaches, resolved with an inward oath that he would prove himself that man, or perish in the attempt.

Not that the Major was wholly devoid of that unpractical machine called a heart. Down in a little villa near a country village, lived a little lady of twenty, who could have told strange tales of the Major's sentimentality. Oh, Major, Major! were not all your flocks and herds sufficient, that you must needs make this innocent ewe lamb a captive to your bow and spear?

But let us do the Major justice. In this matter he was not altogether a free agent. From the moment he met Patty Roseneath he had felt himself fascinated by her in spite of all his attempts to persuade himself of the contrary. That a quiet, almost timid, little provincial beauty, with a general unsophisticatedness of tone and manner, should have any power to enchant the Major of a thousand fights seemed to him too ridiculous an idea to be entertained for a moment. It did not occur to him that it was perhaps this very difference from the women he had been accustomed to flirt with that constituted her charm.

Reviewing the matter that morning in the solitude of his chamber, the Major looked back on this love-passage with a thankful sense of escape. "I was devilish near making a fool of myself that time," said the Major to himself, as he tied his cravat.

But though the Major congratulated himself on being so safely off with the old love, he was far from feeling so comfortable with regard to his prospects with the new. He was too old a campaigner to advance his main body without throwing out skirmishers and outposts, or make a step in an *affaire de cœur* without feeling his way. It was this quality, backed by the Major's real talents and prowess, that made him so invincible. Women never suspected him of wishing to engage their affections, until they found it was too late. And when once the gates were opened, no one knew how to retain a position in the conquered city better than the Major.

But Miss Harford's heart seemed to be impregnable even to this experienced besieger. The Major, who never committed the error of overrating his advantages, confessed to himself that he had done all he knew. Had he not ridden as no man, not professionally accustomed to risk his neck, ever rode before? Had he not got up private theatricals (the Major in 'Used Up' was really worth seeing), and even written a sparkling comedietta, agreed by every one but the Major himself to be equal if not superior to Robertson? Had he not sung those tenor songs of his that would have charmed the savageness out of a bear? And had he not thrown around all his achievements a halo of respectful sentiment, as who should say, "I care not for them except in so much as they are pleasing to you?" The Major could find no fault with himself or with his exertions. He had attacked the fortress with all the paraphernalia of sapping and mining, zigzags and parallels, and still the flag of liberty floated mockingly above the unconquered bastions. There was but one hope,—a forlorn hope, he confessed to himself—and it was with a serious though determined spirit that the Major resolved on an attack by storm. He pronounced this resolution in the memorable words which commence this story. "Dash it!" said the Major, "I'll save her life!"

The Major had made up his mind.

Perhaps, had the Major known who it was that had arrived as a guest to Miss Harford on the previous evening, it might have disturbed his calculations. But there is no reason why we should not listen to the conversation of Diana and her guest as they sit by the bedroom fire in their elegant dishabille.

Miss Harford was a girl of considerable individuality of character. Without affecting any of the airs of a "blus" or an eccentric, she generally thought for herself on many subjects, and would state her opinions pretty strongly on occasion. This caused her to be regarded with suspicion and dislike by most of her own sex, and the weaker of ours. She was unusually, prudish said improperly, well read in the drama of the last century, and actually preferred the school of Sheridan to the school of Schnieder.

"What have I been doing lately?" says she, in answer to a question from her companion. "What am I always doing? I have danced the usual proportion of dances, round and square: I have read the last new novel, and tried the last milk-and-water effusion

they call a ballad: and I have ridden over the usual number of ploughed fields. What more would you have of a woman in my position?"

"What a queer girl you are, Di," says the other lady, wistfully. "You never seemed the same as the other girls at school: and you don't seem a bit altered. And so you haven't fallen in love yet! But I always said you would never find any man to suit you exactly."

"That's just what I'm wanting, my dear,—a Man. I see plenty of amateur jockeys and polite letter writers. What I want is a man—one that is not afraid to be natural, or ashamed to be in earnest. I really think our average dandy, with his cool self-sufficiency, and his insulting indifference, the most unpleasant production of the age. There's the Major now!"

"Who is that?"

"Major Marjoribanks, my dear; the glory of his regiment, and the idol of all the horse-dealers, amateur actors, and fast young men for a circle of twenty miles. Why, Patty, you're blushing! You don't mean to say you know the man!"

"I met him—that is—he is a friend of my brother's," said the other lady, with some hesitation.

"And you've been foolish enough to believe all his nonsense, child, I dare say. Come now!"

"Well, he certainly is an extraordinary man," plended Patty.

"Oh, yes, very. He can ride a kicker, or write a burlesque. But as for *heart*—why, my dear child, he'd toss you aside, if it suited his purpose, with as much indifference as I toss that withered camellia. Now, don't you waste a thought on him. I don't intend to, though the wretched man has been making love to me in his quiet way ever since he came. I'm afraid every day he'll propose, and I shall have the trouble of refusing him without losing my temper."

"But I can't help it," said Patty, faintly.

"Oh yes, you can. You thought you couldn't, down in that dull place, with nothing else to think about, but you'll be under a different treatment here, I can assure you. Plenty of exercise and excitement will soon cure you. I'll tell you what: as a great treat to-morrow you shall ride Crusader. We'll take a quiet canter along the lanes."

"Oh, but I can't ride strange horses," said Patty.

"Oh, you'll soon get acquainted. Mind, I consider this a great favour, and you mustn't hurt my feelings by refusing. One of my habits will fit you nicely, and when you return you'll feel spirit enough to defy twenty Majors."

"You are a darling girl," said Patty, getting up and kissing her.

"I'm afraid you're in a minority, my dear," said Diana. "Most people say I'm intensely disagreeable. Good night, and don't dream of the Major."

And the pair kissed again and parted for the night.

## II.

The next day was one of those mild, hazy, November ones, which break out into a glimpse of sunshine toward noon, and then return to their former dullness. The two girls rode along between the hedgerows, chatting pleasantly.

"I'm sure I shall never be able to manage this animal," said Patty, timidly. "See how he tosses his head about."

"That's because you let him feel the curb, dear; I had it put up sharp on purpose. Have power of punishment, but seldom use it; that's the real secret of managing horses, dogs, and men. There now, you see he goes quietly enough on the snaffle. Now coax him a little, and give and take more; remember he isn't a phlegmatic donkey, with a mouth like a deal board."

"Well, I must say I prefer quiet horses; one feels so much more at ease."

"Pshaw, my dear! I wouldn't give a guinea for a horse that anyone could ride, that took no more notice of a steam-engine than of a haystack. They have just the same dead-level of indifference that is the ideal excellence of the young man of the period, who hears with equal apathy of a railway accident or a revolution."

"Well, I suppose they only follow the fashion, just as in their coats and collars."

"But what an age it must be that makes a dead calm its some of good style, and substitutes Jack Poyntz for Ranger or Charles Surface!"

"Good Heavens, Diana! you don't mean to say you read those horrid old plays? Mamma would not let me study such things on any account."

"Nonsense! As if they could be worse than the French plays one sees now, or half a dozen English ones I could name. At least, I enjoy the male characters more than in ours. They were infinitely more sparkling, and I don't believe they were a bit wicked-er at bottom."

"Gentlemen now could be quite as witty if they cared to try."

"Oh, I don't doubt their abilities, my dear; I suppose the breed of male animals produces about the same number of prodigies in every age; but how is one to know it? I certainly prefer men who kept their wits and their swords equally bright by daily use. Here one is in equal uncertainty as to their livers or their intellects."

"Livers, Diana! What an expression!"

"Strictly Shakespearian, I assure you. 'A lily-livered knave,'—see 'Macbeth.' I daresay you can find a dusty copy of Shakespear on the top shelf in the library."

"Ah, Di! I'm afraid you never will get married at this rate."

"No, dear. As someone says of Morris, 'I shall die the serene martyr of a mean and melancholy time.'"

"You must have had plenty of offers?"

"Oh, dozens! all couched in the condescending brevity with which the *preux chevalier* of the day deigns to express his wishes. Now just contrast the men we have been talking about. Worship, commences by a shower of more or less readable verses, which you have the option of reading or committing to the flames. You

casually drop your handkerchief into a running stream or down a precipice, and your adorer throws himself after it, and restores it at the risk of his life. After a while he throws himself on his knees—both knees, mind—and begs you to save him from destruction. You relent; on leaving you he meets his rival: a glance is enough; swords flash out—so did Diana's eyes—and woe to him who flinches."

"Horrible!" said Patty.

"Will this suit you better? Strephon strolls lazily into the room; remarks on the weather; allows himself to decline into a seat by your side, and suggests that you should become Mrs. Strephon. *En attendant* he meets his rival; treats on his toes; they exchange abusive epithets, light cigars, and—oh, bathos!—cut each other at the club."

"Well, that's better than fighting," said Patty.

"And infinitely safer. Well, my dear, perhaps, after all, you are right. We mustn't take our idea of the class from Sir Harry Wildair—there's a darling name for you. They only show what was considered the thing. I daresay I am getting fearfully crabbed. You see when a girl has money she becomes the centre of a circle of deception. Let's change the subject. How well that habit fits you."

"It feels rather strange. You see I so seldom ride at home."

"Ah, of course. Now to me habit is second nature, as someone says. I feel infinitely more comfortable in one than in a low dress I purposely lent you my regular riding-hat, for I wanted to see how I should feel in this new-fangled affair. I'm afraid it wouldn't suit crabbing through a bullfinch; one wants something stiffer for that. . . . What's that?" she cried, as an indistinct sound came down the wind, and both horses pricked up their ears. "The hounds; they must have come all the way from Marlford."

"Oh do look at this horse, Di! He's dancing up and down fearfully."

"Put him on the curb, dear, if he's too troublesome. Ah, there they go! Look, Patty, there's a sight for you! See how close they run together! There's Mr. Vane on Brown Bess. Well tried at Mr. Vane! Ah, the Major does it—oh, the conceit of that man!—and here come the rest; only two gaps for all the poor creatures. There's my little brother Bantry bringing up the rear on his pony—a terrible hard fellow is Bantry. Oh, Patty," said Diana, trembling with excitement, "I'd give anything to be with them."

"Then do go, dear," said Patty, with an effort of self-sacrifice that was enormous. "I shall be safe enough. Withers will take care of me."

"Well, he's just down in the road there. Keep along it, and you'll just cross the line they are taking. I really must—come, Terry," and away went Diana, habit tossing and eyes glistening, and vanished gloriously.

Patty turned her horse's head back towards the gate of the field they had turned into, and got safely out into the road. Some distance down it she could see Withers, the groom, who was having a little difficulty with his horse, which was plunging and curvetting in a diagonal position, as is the manner of eager horses, performing an equine balance-step without advancing particularly. On Crusader catching sight of his companion in ill-doing, he proceeded to imitate his actions with a considerable amount of exaggeration. Patty, finding him bursting into a canter, attempted to take up the curb rein, but only succeeded in getting both in an inextricable confusion. Then she she clung in terror to them with both hands, on which the irritable Crusader fought himself into a confused canter, which developed itself into a smart gallop, dashed past the astonished Withers, and stamped.

Our friend the Major had arrived at the meet that morning, and was considerably chagrined not to find the object of his intentions present. "The stiffest bit of country for miles round, too," he said to himself. "What can she be thinking of?" His determination of the morning was still in his mind, and he longed for an opportunity of putting it in practice. Oh, for the sight of the well-known blue habit and iron-grey steed! The Major was destined to have his aspirations gratified in an unexpected manner.

He had been riding a line of his own for a short distance, and was separated from the rest of the field by the breadth of a pasture when he heard the quick-repeated rattle of a horse going at full gallop in the road on the other side of the high hedge, parallel to which he was riding, and in another moment he saw through the twigs the horse he had looked in vain for at the meet tear past him at mad speed, the blue habit streaming back as the wearer swayed in the saddle, holding the reins in both hands with the convulsive grasp of fear.

"Run away, by Jove!" said the Major, turning Zerlina's head without the least hesitation at the quickset. Two or three *intrins*, short strides—a rise, and a crash of twigs,—a rattle of horse-hoofs as they patter on the hard road, as Zerlina just manages to save her knees and nose from damage by a clever recovery, and then the Major, as cool as if he had been hopping over a gutter instead of one of the ugliest drops in his experience, set her going in pursuit.

The fact was, the Major was in that state of exaltation that every soldier feels on coming into action. Quick as lightning he saw the coming situation, and braced himself to take advantage of it, and as he crept nearer and nearer to the fugitives he felt his confidence rise in his horse's powers and his own.

About half a mile from the place where this stern chase commenced, where the road was crossed by another at right angles, stood an inn called the *Cross Keys*. The Major knew this, and also that on the other side of it the road dipped down into a rather steep hill. He had got up some twenty yards nearer when the inn appeared in sight, and, keeping on the turf at the side of the road, that the noise of his approach might not add fresh speed to the runaway, he called on Zerlina smartly for a decisive effort.

In front of the *Cross Keys* there was a triangular patch of sordid turf, and as Crusader came upon this he slackened his speed very slightly; the Major dashed alongside and seized the reins near the bit in his right hand; the horse, which was not a vicious one, stopped

after a few struggles, as he felt the power at work on the curb; and the lady, falling fainting forward in a heap on his neck, would have tumbled to the earth, had not the ever-ready Major leapt from his saddle, and caught her in his arms. It would have made a capital picture—the two horses standing steaming and panting, and the Major staggering under the weight of the senseless damsel, whose chin hung over his shoulder—while her hair, released from its bonds in her wild flight through air, streamed down his scarlet-coated back.

With some difficulty the Major carried his lovely burden into the porch of the *Cross Keys*.

"Show me a private room, and get me a glass of brandy!" were the orders with which he stopped the mouth of the astonished landlady.

"La! Poor dear young lady!" said that female, in a voice of sympathy, as she brought the restoring fluid. "Can I do anything for her, sir?"

"No, I think not," said the Major decisively. "Leave her to me. I've had some experience in cases of this kind," and thrusting half-a-crown into the woman's hand he shut the door in her face.

"Well, how she could ha' married he!" said the woman to herself, as she returned to the bar. She evidently thought, from the Major's want of sympathy, that he must be the husband of the sufferer.

The evening glooms were just closing in, and made the little back-parlour look more and more dismal and dingy. The Major raised the clinging veil sufficiently to thrust the edge of the glass between the lips of the patient. Presently the colour came back to her face, she drew a long gasping breath, and felt for her pocket-handkerchief. It was in the pocket of her saddle—the Major instantly placed his snowy cambric in her trembling hand. Then she overflooded.

The Major waited a little. Then he ventured to take the hand that was not occupied with his pocket-handkerchief, and said in a tone respectful tenderness.

"Don't, *pray* don't give way so! You're quite safe now, I assure you."

Sob, sob.

"If you knew how every sob you utter reads my" ("vitals," the Major was going to say, then he thought of "breast," and finally substituted) "heart, you—you wouldn't keep on so."

Sob, sob.

"You don't know how I have hoped, have longed for a moment like this; to hold your hand in mine, to feel that we are alone together, that you do not repulse me, that I am permitted" (*kins her hand*), "that you do not forbid me." (*Business as before*.)

Sob, sob, sob. "When will she stop?" thought the Major.

"You do not answer; speak to me,—or hear me while I tell you what I have wished to say for long days past. Miss Harford—Diana, I love you!" That was deucedly well put, thought the Major to himself.

"SIR!" said the lady, suddenly becoming electrified into an erect posture. It was but one word, but it was quite enough to almost throw the Imperturbable off his invincible equilibrium. For that moment Miss Roseneath could boast of having seen that great man, to use a common but expressive term, flabbergasted.

"Patty!—Miss Roseneath!"

"Yes, Major Marjoribanks, Miss Roseneath. Oh, take me home, and never, *never* dare to call me Patty again!"

"The—de-vil!" said the Major, slowly, beneath his moustaches.

"You might have been satisfied with making a fool of a poor silly girl, without insulting her afterwards. Oh, how could you be so o—o—cruel!"

"I say, Patty—listen a moment—don't talk like that. You don't suppose I meant to hurt your feelings? Hang it, I ain't such a cad as all that comes to. I didn't know it was you—I took you for—"

"Oh, I know; you took me for Miss Harford. Dear Di! she told me you had been making love to her since you came. But I thought you had only been fl—fl—flirting," said poor Patty, going off again.

"Did she tell you that?" said the Major.

"Yes; and she said you were a conceited man, and she was afraid every day you'd propose, because she would have the trouble of refusing you. I never told her all you said to me down at Rosewood. Silly that I was, ever to believe in a Major!"

Did pique and chagrin at the intelligence that he had just received prompt the Major's next impulse? Or did his better angel whisper to him that a dinner of herbs with this little woman who really loved him, and for whom he was conscious of a feeling as nearly akin to that passion as he was capable of experiencing, would be better than a more splendid repast with her to whom he was indifferent? Bitterly would he have derided such an idea from another; bitterly that morning would he have laughed at the thought of his present conduct. But few men act up to their principles; and it was with a ring of genuine feeling in his voice that he sat down by Patty's side and said—but we will not write his words; they were devoid of that artistic fluency which generally distinguished the Major's utterances to the fair sex; but to Patty they sounded like flowing honey.

"And you really *will*,—and you're not sorry for what has happened?"

"Well," said the Major, looking down into her eyes, which gazed up through her tears, glistening with mingled light and teardrops—"perhaps it wasn't such an unfortunate mistake after all!"

Would you be surprised to hear that the Major makes a capital husband? He lives in an atmosphere of spuds and steam-ploughs, cattle and county magistracy, and when, on some summer's eve, the cloud-compelling cigar being lighted, he lies upon his lawn, and sees his young barbarians all at play, he really does not look unhappy. Sometimes a young lady, who is getting older, comes to see Mrs. Marjoribanks and the children. She it is who has given Fred his

pony and Maurice his terrier. She is still unmarried, and intends to continue so.

"And yet I always thought you *would* marry, some time or other," says Patty to her visitor, as the Major passes the window. "And I know someone that thought so too, at least at one time."

"Ah, my dear," says Diana, with a slight, comical curl of her lip, "that was THE MAJOR'S MISTAKE."—*Temple Bar*.

### DOUBLE ACROSTIC.

Precedent havoc conveys a threat;  
All fear of danger has not vanished yet.

1.

Woe, pleasure, jealousy, honour, glory,  
May all depicted be in one short story.

2.

An office all men think they can discharge,  
From peer of realm to captain of a barge.

3.

All from one centre springing, spokes of wheels,  
Spheric divisions, vertebrae of eels.

4.

"You bet your final dollar," 'tis n't white  
In roses seen sometimes, not always quite.

5.

Describes your ignorance or laziness,  
If palpable conundrum you can fail to guess.

6.

An exudation draining shrubs and trees,  
Is used in medicine. Name it, if you please.

7.

Of "poets' irritable race" I've read,  
And know much shorter phrase will do instead.

8.

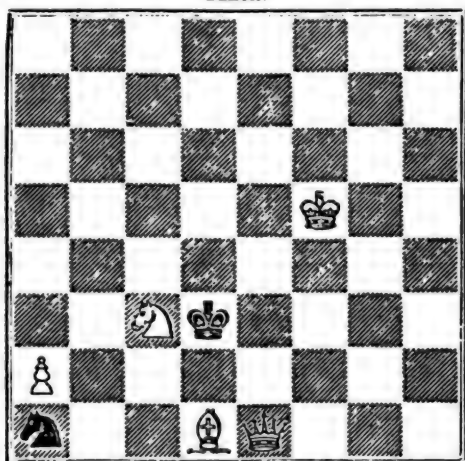

When you've deciphered this, indite a letter  
Or an epistle, which will be far better.

### METEOROLOGICAL REPORT

FOR WEEK BEGINNING FRIDAY, APRIL 30TH, 1880.

Observatory of Daigaku, Moto-Fujicho, Hongō, Tokio, Japan.

### REMARKS.

Heavy line represents barometer.

Light continuous line—max. & min. thermometers.

.....represents velocity of wind

.....percentage of humidity

Max. velocity of wind 23.5 miles per hour on Thursday, at 2 p.m.

The barometer is reduced to the freezing point and to the level of the sea.

The highest reading of the barometer for the week was 30.215 inches on Sunday, at 10 p.m., and the lowest was 29.599 on Friday, at 10 p.m. There has been a steady fall in the barometer since the maximum of Sunday. The total amount of rain for the week was 1.49 inches, and on Saturday at 2 p.m. a little hail fell.

### SHIPPING INTELLIGENCE.

#### INWARDS.

May 2, British steamer *Belgic*, Meyer, 2,627, from San Francisco Mails and General, to O. & O. Co.  
May 2, Japanese steamer *Saminoye Maru*, Frahm, 856, from Hakodate, Mails and General, to M. B. Co.  
May 2, French steamer *Tanaia*, De la Marcelle, 1,735, from Hong-kong, Mails and General, to M.M. Co.  
May 2, British steamer *Sunbeam*, Dobson, 1,154, from London via China and ports, General, to L. Kniffier & Co.  
May 2, British steamer *Radnorshire*, Davis, 1,201, from London via China and ports, General, to Adamson, Bell & Co.  
May 2, Japanese steamer *Saminoye Maru*, Frahm, 854, from Hakodate, Mails and General, to M. B. Co.  
May 3, Japanese steamer *Toyoshima Maru*, Hubbard, 597, from Kobe, Mails and General, to M. B. Co.  
May 4, Japanese steamer *Tamaura Maru*, Carrow, 558, from the North, General, to M. B. Co.  
May 6, Japanese steamer *Shario Maru*, Kilgour, 800, from Kobe, Mails and General, to M. B. Co.  
May 6, German barque *Oscar Mayer*, Roder, 360, Sugar, from Takao, to Grauert & Co.  
May 7, American steamer *City of Tokio*, Maury, 5,050, from Hong-kong, Mails and General, to P. M. Co.  
May 7, British barque *Oceana*, Firth, 320, from Takao, Sugar, to Chinese.

## PASSENGERS.

Per British steamer *Belgie* from San Francisco:—Mr and Mrs. Heinemann, Mr. and Mrs. Mollison, Mr. and Mrs. Farley, Messrs. K. Yaye, R. Arai, M. Levy, H. J. J. C. Ambers, F. Hayne, E. Webb, C. J. Battelle, J. Duncan and 3 Europeans in steerage. For Hongkong: Mrs. Mitchell, Mrs. Etta Gray and Messrs. J. A. Eakin and T. Covie. 185 Chinese in steerage.

Per French steamer *Tanaia* from Hongkong:—Messrs. Lenormand, Volhardt, Moss, Heelc, Arnoux, Moto, Horosaki Atr ui, Boinville and infant, Arachie, and Stingelin.

Per British steamer *Rudnorshire* from London via China ports:—Mr. and Mrs. Lang, Mr. and Mrs. Hannah and servant, Mr. R. B. Armitage and servant.

Per Japanese steamer *Suminaga Maru* from Hakodate:—Mr. Bishop in cabin; 71 Japanese in steerage.

Per American steamer *City of Tokio* from Hongkong:—Dr. and Mrs. Buckle, Mr. and Mrs. G. Sale and six children, Mr. and Mrs. Manley, two children and servant. For San Francisco: Messrs. M. Falconer, H. E. Hobson, R. H. Bruce, Mrs. Chnn She, child and servant in cabin. 5 Europeans and 500 Chinese in steerage.

## OUTWARDS.

May 1, Japanese steamer *Sumida Maru*, Hubenet, 896, for Hongkong via Kobe, Mails and General, despatched by M. B. Co.

May 2, British barque *Crossfield*, Ewart, 774, for Kobe, General, despatched by M. Raspe.

May 2, Japanese steamer *Tokai Maru*, Hogg, 652, for Kobe, Mails and General, despatched by M. B. Co.

May 3, American barque *William Hales*, Hoyt, 868, for Guam, Ballast, despatched by H. MacArthur & Co.

May 4, British steamer *Belgie*, Meyer, 2,627, for Hongkong, Mails and General, despatched by O. & O. Co.

May 4, Japanese barque *Kinokuni Maru*, Nicol, 960, for Nagasaki, Ballast, despatched by M. B. Co.

May 5, Japanese steamer *Hiroshima Maru*, Haswell, 1,200, for Shanghai and ports, Mails and General, despatched by M. B. Co.

May 6, Japanese steamer *Toyoshima Maru*, Hubbard, 946, for Kobe, Mails and General, despatched by M. B. Co.

May 6, British steamer *Malacca*, Seaton, 1,709, for Hongkong, Mails and General, despatched by P. & O. Co.

May 8, German schooner *Johann Heinrich*, Oestmann, 411, for Nagasaki, despatched by Jardine, Matheson & Co.

May 8, German schooner *Auguste Reimers*, Thomsen, 207, for Takao, despatched by E. B. Watson.

## PASSENGERS.

Per Japanese steamer *Sumida Maru* for Hongkong via Kote:—Dr. Scheube, Messrs. Shimidzu and Ikuma.

Per Japanese steamer *Hiroshima Maru*, for Shanghai and way ports:—His Excellency and Madame Stoeetwegen, Col. Dickinson, wife and child, Mrs. Bryan, Mr. and Mrs. Macy, Mrs. Dickson, Miss Grant, Mrs. Hubbard, Mrs. Brower, Mr. and Mrs. Hannah, Mr. and Mrs. Lang, Mr. and Mrs. Oku, Mr. and Mrs. Yano, Mr. and Mrs. Suzuki, Mr. and Mrs. Nishikawa, Miss Iida, Messrs. A. H. Groom, Kagawa, Ito, Mayeda (Japanese Consul to Corea), L. Van der Polder, W. Bransen, Watanabe, Kamada, Murahashi, T. Hayne, Iida, M. Pors, Mayekawa, Satake, Katsumata, Terashima, Kato, Kawatani, J. Robert, Uchiita, Inoye, Ujima, Doi, Ooi, Kawasaki Nishima, Captain Perkins, Dr. Perkins, Miss Donors and Dr. Lawrenson.

Per British steamer *Malacca*, for Hongkong:—Mr. and Mrs. Chipp, Mr. and Mrs. Bigglestone, Messrs. Howie, M. Dames and J. Henry in cabin; and A. McDonald, J. Macfall and three Chinese in steerage.

## CARGOES.

Per French steamer *Tanaia* from Hongkong:—

Cargo from Hongkong ... .. 2,607 pkgs.  
" " Europe... .. 2,269 "

Per Japanese steamer *Hiroshima Maru* for Shanghai and ports:—

Treasure ... .. Yen 152,526.00  
" " " " " " \$10,000.00

Per American steamer *City of Tokio* from Hongkong:—

Cargo ... .. 2,661 tons  
Mails ... .. 19 pkgs.

## REPORTS.

The French steamer *Tanaia*, reports: Left Hongkong 26th April. Experienced variable winds and fine weather to coast of Japan, thence to port N.E. winds accompanied with thick rainy weather. Arrived in Yokohama at midnight on the 2nd instant.

The British steamer *Sumner* reports: Left Hongkong March 23rd. Experienced moderate variable winds with fine weather to Ooshima; thence to port, N.E. winds with thick rainy weather. Arrived at 8 a.m. 2nd May.

The British steamer *Rudnorshire* from London, via Hongkong reports: Left Hongkong April 24th. Experienced variable winds with fine weather to coast of Japan; thence to port, strong N. E. winds with thick rainy weather. Arrived at 1 p.m. 2nd May. Passage 7 days and 11 hours.

The British steamer *Belgie* reports: Left San Francisco April 10th, at 2.11 p.m. Experienced strong prevailing westerly winds throughout the voyage. Arrived at Yokohama, May 2nd, at 1.32 p.m.

The Japanese steamer *Suminaga Maru* reports: Left Hakodate 29th April at 2 p.m. Experienced variable winds with thick rainy weather. Arrived at 11 a.m. on the 2nd instant. Passage 35 hours.

The German barque *Oscar Mayer* reports: Left Takao on the 21st of April. Experienced fresh north-easterly winds on the Formosan coast and to the Linschoten group; thence to port variable winds and weather. Arrived May 6th; passage 14 days.

THE GREATEST  
WONDER OF MODERN TIMES  
HOLLOWAY'S PILLS.

Persons suffering from weak or debilitated constitutions will discover that by the use of this wonderful medicine there is "Health for all." The blood is the fountain of life, and its purity can be maintained by the use of these Pills.

SIR SAMUEL BAKER,  
in his work entitled "The Nile Tributaries in Abyssinia," says, "I ordered the dragoman Mahomet to inform the Fokey that I was a Doctor, and that I had the best medicines at the service of the sick, with advice gratis. In a short time I had many applicants, to whom I served out a quantity of Holloway's Pills. These are most useful to an explorer, as possessing unmistakable purgative properties they create an unerring effect upon the patient, which satisfies him of their value."

SIMPLE, SAFE AND CERTAIN!  
HOLLOWAY'S OINTMENT.

Is a certain remedy for bad legs, bad breasts, and ulcerations of all kinds. It acts miraculously in healing ulcerations, curing skin diseases, and in arresting and subduing all inflammations.

MR. J. T. COOPER,  
in his account of his extraordinary travels in China, published in 1871, says—"I had with me a quantity of Holloway's Ointment. I gave some to the people, and nothing could exceed their gratitude; and, in consequence, milk, fowls, butter, and horse-feed poured in upon us, until at last a tea-spoonful of Ointment was worth a fowl and any quantity of peas, and the demand became so great that I was obliged to lock up the small remaining stock."  
Sold by all Chemists and Medicine Vendors throughout the World  
May 17th, 1878. tf.

## COMMERCIAL INTELLIGENCE.

**IMPORTS.**—Still dull and inanimate. Kinsatsu have steadied and buyers are busy taking delivery of former purchases. On the other hand the country people are engaged with the Tea and Silk crops, and for the present we look for a dragging market. Quotations must still be considered nominal with hopes of improvement all round next month.

**COTTON YARNS:—**

Nos. 16 to 24 Common to Medium ... per picul	\$29.00 to \$2.00
" " Good to Best ... ..	\$32.50 to \$5.00

Japan Rice ... ..	\$2.70 to \$2.90
Kerosene Oil ... .. case	\$1.50 nom.
Newchwang Peas ... .. picul	\$2.20

**EXPORTS.**

**SILK.**—Scarcely any business has been done in Silk during the past week, and sales amount to only 50 shippings bales. Prices are very irregular and rather weak; but in quoting it must not be forgotten that the silk offering now is, as a rule, very mixed, and sufficient allowance must be made for this.

Stock about 2,500 Japanese bales.

Total export to date 17,400 bales against 17,897 bales last year.

## TEA ADULTERATION.

SPECIAL attention has of late been directed in Europe to the sophistication of the leaf whose infusion makes the chief beverage of millions of people in Europe. England and Russia are the chief consumers, in that continent, of the Chinese product. France takes two hundred times less than Great Britain; but, notwithstanding this, it has fallen to the lot of a French chemist to illustrate adulterations which have heretofore been unsuspected in London. It is not the constituents which are employed in firing the leaf, whether in China or Japan, for foreign consumers that are chiefly disagreeable or baneful. The comparatively very small quantities of gypsum, Prussian blue, indigo, and other substances, which are used in the pans for the purpose of imparting a face to the material, have often been pronounced by competent authority practically innocuous. Why tea-drinkers should prefer to have their drink impregnated with ever so small a quantity of avoidable dirt to imbibing the pure and simple decoction of the plant prepared without it, may be a matter of mystery; but it is not our present purpose to inquire into the cause of this or any other anomaly in the matter of the taste of nations or individuals. Our desire is to sound a note of warning to those who, by fair dealing and the provision of an all but unimpeachable article, have secured for their wares a mart the profits from which are adequate, and may be reckoned upon with certainty for a distant future, so long as attempts are not made to enhance them by fraudulent practices. As with silk so with tea, Japan has attained in America a very high reputa-

tion for the integrity of her merchandize. It would be suicidal to jeopardize it by introducing a system of adulteration into her exports. A Chinese poet wrote of tea that "it tempers the spirits and harmonizes the mind; dispels lassitude and relieves fatigue; awakens thought and prevents drowsiness; lightens and refreshes the body, and clears the perceptive faculties." When impregnated with the ingredients used to falsify it in China and at home, it can hardly be expected to retain those attributes. The "Maloo mixture," which people attempted some few years ago to make in China, did serious damage to the trade of Shanghai: and yet it was not much worse than many of the other "lie teas" which have been so largely exported thence, and whose histories and composition are wonderful exemplifications of misdirected industry.

We have all known, probably, for as long as we can remember, that sloe leaves and other products of English hedgerows and shrubberies, to say nothing of the expended refuse of the teapots of hotels and coffee-houses, are no strangers to the stock in trade of the country and metropolitan grocer. Catechu and sumach leaves, entirely innocent of connection with the frauds of *thea bohea* or *thea viridis*, have, mixed together in ascertained proportions, and christened with high-sounding names, been palmed off upon an easily deluded British public as a tea possessing "four times the strength of the strongest tea previously known." Perhaps the compound justified the assertion, but certainly not in the sense in which the consumers understood it. Again, in former years, a "Chinese botanical powder" which had some vogue, was found to be little more than a composition of catechu (the product of the *Gambir Acacia*) formerly and erroneously known as *terra Japonica*, and ordinary wheaten flour. Still more patent devices were those not very long ago, if they are not still, resorted to by celestials to add weight to their wares. Leaves ingeniously enclosing iron filings were shipped away by the chest. Less audacious but scarcely more justifiable schemes were, and are now, resorted to, in order to give false or inferior articles the semblance and aroma of excellence. Olives, gardenia, and jasmine have all had tribute taken from them to supply the tea-chest; and it is notorious that a certain kind of camellia is largely cultivated in special districts of the neighboring empire for intermixture with the genuine leaves. The willow, again, does very extensive duty on behalf of the counterfeiter. During April and May its twigs are pillaged of their growth, which, after being subjected to a slight fermentation, is carefully dried and rolled, and dusted into green tea to the extent of ten or twenty per cent. This practice, which is described "as ingenious as it is profitable," had its origin in the model settlement of Shanghai about fifteen years ago, and is said by the analyzer to be continually extending. It is odd that the Chinese carry on their operations openly, and indeed neither do

nor need care about their customers, as they manage to get rid of all their production, spurious or the reverse. What between Mongolian and Circassian dexterity in fraud, it would perhaps be difficult to particularise foreign substances that have not found their way into the bins of the teamen, and then into the cups and stomachs of their customers. Twenty years ago excise investigation had discovered,—in addition to the products which we have enumerated,—contributions from the horse-chestnut, the elm, poplar, beach-plane, fancy-oak, several gums, and other vegetable matter not resembling tea-leaves in any one particular. But organic matter is not sufficiently copious in its resources to satisfy the greed of the dealer. We have said that a little Prussian blue and gypsum and indigo, used in what we will consent to call the legitimate manufacture, may be allowed in deference to the queer taste of foreign fashion. We hardly imagine, however, that “taste” would care to know that it swallows, in considerable quantities, from the uninebriating bowl, sulphate of lime, and such repellent filth as earthy black graphite. Magnesia may have useful effects, which, however, are certainly not contemplated by the dealers who employ it. It is said to aid the water in extracting gluten from the leaf, but this advantage is hardly a factor in the adulterator’s motives for adding it to his compound. This may contain also, such vile coloring matter as Venetian red, Dutch pink, rose pink, with chromate of lead, carbonates of lime, copper and magnesia, sulphates of iron, French chalk, and, in fact, almost anything. Whether the headaches and internal disturbances which are said to be occasionally produced by tea-drinking, may not have their origin rather in the alien matter too frequently present in the infusion, at least in European countries, we will leave to the sense of our readers to determine. A learned authority states that “tea possesses a specific and marked influence over the functions of the brain.” He might have added that its abundant concomitants must exercise a “marked and specific” effect upon other organs.

As we have already said, the practices of falsification here alluded to have, at least as far as we are aware, only been applied to the Chinese product, either in the places where it is grown, the ports where it is shipped, or the marts for which it is destined. We have every reason, as we have every desire, to believe that the Japanese leaf, with the exception of the simple and probably uninjurious additions which it receives in the firing process, is uncontaminated. And that this should continue to be the case all those who look forward to a prosperous and increasing commerce, for the growers and shippers in this empire, in one of the most gracious of nature’s gifts to bibulous mankind, will desire. Hence it is important that notice should be taken of very bad news which comes to us from another port. The *Hioyo News* distinctly states, on what is averred to be direct personal evidence, that hundreds of Japanese were lately engaged, on the hills behind Kobe, in plucking the leaves of the *wistaria* and drying them in the sun. The writer continues:—“These leaves were taken to the village of Kita-no-mura, presumably for the foreign market. On being asked what they were to do with the leaves, the natives coolly told foreigners that they were making tea! The open and flagrant manner in which the operations were carried on, are not however so astonishing as the stupidity of the natives in taking this particular leaf for the purpose of mixing it with the genuine tea. In musters which have come to the hands of foreign merchants in Kobe, the *wistaria* leaf has been detected, and no foreign dealer would ever venture to send a consignment of such tea to any house in America; for if he did, it would be the

last he would be likely to send. The *wistaria* leaf is not unlike the tea leaf, except that it is not so heavy; but it is altogether unsuitable for mixture with tea, for the purpose of increasing the bulk, which is the dishonest purpose the natives have in view. The admixture of itself defeats their fraudulent purpose, for the presence of one leaf of the *wistaria* in a cup of tea is enough to make it undrinkable. It requires no practised tea-taster to discover the presence of the leaf; anyone who has a palate at all can easily tell that there is something very disagreeable in the taste of the tea when this *wistaria* leaf is in the infusion. The result, therefore, is that nobody will buy the tea so adulterated which has been brought to the market.” This is of itself a fortunate circumstance; but, when once a nefarious course is initiated, it is only too likely to acquire fresh developments. No one will deny that the preservation and extension of so valuable an industry as the tea export trade, have profound interest for all classes in the country. It might be advisable for the Government to protect the national welfare in this respect by the establishment of a system of inspection of which the growers should bear the cost, which, otherwise would not be heavy. Possibly, however, vigilance on the part of the tea-men inspecting and tasting their musters, and stern discountenance and reprobation of dealers detected in dishonest attempts, will be sufficient to meet the emergency. By some means or other, however, producers and brokers must be taught that integrity in this respect will pay better than fraud. A few shipments of adulterated tea from Japan would seriously injure, if it did not destroy, that branch of trade, an evil consummation which neither native planters nor foreign shippers can afford to see achieved.

#### EXTRA-TERRITORIALITY IN CYPRUS.

A REMARKABLE instance of one of the resulting evils of extra-territoriality occurred recently in Cyprus. That island is held by the British Government under an arrangement with Turkey, which provides, among other stipulations, that Great Britain shall administer the island and receive the revenues, paying to Turkey the annual sum of £120,000. The position of Great Britain is, therefore, apparently that of a tenant; and a tenant of course can only occupy the property leased, subject to any liabilities entered into by his landlord prior to the creation of the tenancy. For example, suppose the case of the owner of a field granting a right of way over it to a neighbouring proprietor and subsequently leasing the field to some third person; then the tenant could not interfere with the right of passage created by the landlord. Now, under certain capitulations and conventions entered into from time to time for centuries past, extra-territoriality obtains in Turkey pretty much to the same extent as in Japan. The island leased to Great Britain formed no exception to the rest of the Ottoman Empire, and lately, in consequence of a simple accident with a paint-pot, the important question has been raised whether the status of foreigners, as regards responsibility to the territorial tribunals, is in any way affected by the occupancy of the island by Great Britain. The facts of the case are simple. Towards the end of January, the Austrian Lloyd’s mail steamer *Espero*, Captain Colombo, came into the Cypriote port of Larnica, and a Custom-house guard was put on board as usual. The rapidity of the steam-winch in discharging the cargo attracted all the guard’s attention, and he, while staring at it, upset without knowing it, a tin full of paint, which fell into the engine-room while the en-

gines were being cleaned below. At the mischief and the mess occasioned by the accident, the engineer ran on deck, greatly annoyed as can very well be imagined and, on the impulse of the moment, gave a box on the ears to the guard, a raw Turk, who retorted by using all the refined insults of the Turkish vocabulary. Later in the day the guard sent word to his superiors, accusing the engineer of assault. Upon the representation of the English superintendent of Customs, Commissioner Cobham issued a summons, which was sent on board with two zaptiés and an official, calling on the offender to come on shore and be tried forthwith. The captain, who was bound within two or three hours to proceed with the mails, refused to allow his engineer to comply with such orders, sent directly on board an Austrian steamer, and advised his Consul of the fact. The zaptiés, it appears, had orders to use force in case of resistance, and of this they told the captain, who is stated to be one of the best the company have, and knew well his legal rights. He gave these worthies to understand that he knew all about extra-territoriality, and that he was not bound to obey other orders than those of his own authorities, and that if they attempted to carry their threat into execution, he would be obliged to put them in irons and keep them on board. The official who accompanied the zaptiés sent on shore for instructions, and for further assistance if he was to execute the orders he had received. In the meantime the agent had cleared the steamer, and before any decision was taken by the Commissioner, and so soon as the mail bags were on board, the captain heaved anchor; and, allowing just time enough to the zaptiés with their officer to vacate as best they could, he proceeded on his voyage.

The steamer returned in the ordinary course to Larnica about the middle of February, Captain Colombo probably thinking the little episode of his prior visit entirely forgotten. If he had any such idea he was quickly undeceived; for a fresh summons was issued against the engineer, and this time five zaptiés, under the English sub-lieutenant of police, were sent to enforce obedience to the summons, with express orders to bring out the engineer, by force if necessary, and to arrest anyone who might interfere with their movements. The party arrived on board shortly after twelve o'clock, and the vessel was to leave at four. Again the captain proved equal to the occasion, and, arming his crew, threatened to resist any attempt to capture the engineer. The officer finding it impossible to carry out his instructions returned on shore, upon which the Acting-Commissioner sent a verbal message to the Austrian Consul, asking him to order the captain to surrender the engineer. The Consul, however, refused to entertain any verbal message, and sent word back that any communication which the local authorities had to send must be made in writing and in an official way. The Acting-Commissioner refused to comply with this apparently reasonable request, gave orders to have the ship's papers stopped, and made preparations to send a strong force of military police on board. The Consul upon this wrote to the Acting-Commissioner, drawing his attention to the false position in which he was placing himself, and the serious responsibility which he was assuming, and also warning him that his conduct was contrary to the existing capitulations, to special treaty convention, and to international law. He also telegraphed the facts of the case to the High Commissioner, who solved the whole difficulty by immediately ordering the release of the ship's papers. The *Espero* accordingly left Larnica in triumph with the offending engineer safe and sound on board.

The provisional state of matters in Cyprus will evidently be the cause of many unpleasant misunderstandings,

English officials not being accustomed to have their authority set at naught on the score of extra-territoriality. The sooner, therefore, that some distinct arrangement is made, which will have the effect of preventing similar complications in future, the better it will be for all parties concerned. Suppose that lives had been lost in an attempt to capture the accused engineer, and it had afterwards been ascertained that the English officials had exceeded their legitimate authority? Surely the dearly-prized reputation of England would have suffered incalculably in the opinion of the world.

#### CHINESE FAMILY LAW.

SPECIAL attention has been directed to this subject among the English communities in the East for several months past, or, indeed, since the revelations made in the Police and Supreme Courts of Hongkong showed that the family law of the Chinese had been allowed to prevail, in all its phases, in that colony to the prejudice of the law of the great Western Empire of which that colony is but a dependency. The matter is of considerable interest; and we have more than once alluded to it in connection with the proceedings of the Governor and Chief Justice, who are, both of them, anxious and determined that the abuses which have been allowed to exist under British rule shall be extirpated. It is gratifying to know that, as we have constantly asserted, the Home Government will not only aid the local functionaries in their efforts to effect reform, but will, if necessary,—if the opposition of the colonists, of any class or race, should prove too serious to be overcome by the constituted power of the island,—add the weight of its own authority to the cause of justice and humanity. Sir John Smale recently announced, in an address delivered from the bench, on the occasion of some people who had been concerned in kidnapping receiving the reward of their deeds, his adherence to every proposition that he had previously enunciated. He remarked that if the evils, the existence of which had been made patent, were not hunted out and brought to justice, the responsibility would devolve upon those whose duty it was to discover instances of them and bring them before his tribunal. And he added that what had been said in England, and especially in Parliament, proved that the full extent of the responsibility was there recognized, and that such states of servitude as had been allowed to exist would no longer be permitted. This should have been a foregone conclusion; and it probably would have been so regarded by everyone but for the totally unexpected defence of the existing order of things, which was formulated by a noted sinologue, a missionary, Dr. Eitel, who is also employed by the Hongkong government as "Chinese Secretary." Of this apology the Judge remarked:—"A great linguist, an eminent scholar of the talented Max Müller school, has given poetical harmonious colouring to the state of domestic slavery in China. In doing this he has left his special studies and trespassed on pastures new. He has boldly wandered into the region of law with all its pitfalls. He has attempted to define the happy status of Chinese family life as it exists under the benignant reign of the *patria potestas*. Does the unenvied man live who has not in youth with the poets mentally luxuriated on the pastoral plains of Arcadia or under the wide spreading beeches of Italy, yet who has not been undeceived by matter of fact history, and been taught that in truth rapine and brigandage devastated these regions of poetic peace? Just so with *patria potestas*—beautiful in theory and in the exceptional case where the head of a household is benign—

naut, but how much worse than a chaos of crime and misery where the "paternal" master is the unchecked, cruel, or brutal tyrant, as is almost always the case where power is absolute, according to the well-recognised tendency of human nature even among the educated,—all but universal where slavery has existed, in the West Indies, in Cuba, and Peru,—and why not in China?"

Another missionary, Dr. Doolittle, quoted by Sir John Smale, in a work entitled "Social Life of the Chinese," a work which was the result of fourteen years intercourse with the natives at Foochow, and was not written "to square facts to fit a theory, but to present a photograph, as it were, of China life in a singularly fair spirit, under the heading "domestic slavery," groups the very "*patria potestas*" which Dr. Eitel defends. We learn that the head of the family has full power over his wife, his concubines, his children and his purchased and inherited slaves. "Parents can sell their children to be slaves or to be the adopted children of the buyer . . . . Husbands can sell their wives to be the wives of other men, not to be their slaves. . . . Those who have bought children of their parents can sell them to others. . . . Children are not unfrequently stolen from their parents, taken to some other parts of the province or empire, and sold for slaves. . . . The Chinese use the same terms to indicate the sale and purchase of children and wives that they use when speaking of the sale and purchase of land or cattle or any description of property. . . . In case of a parent selling his child a document is given to the buyer, stating the name of the child and the price for which it is sold, whether sold to be the slave or the child of the buyers, &c." How such a system as this can be held "benignant" is hard to conceive. One would think that "benignity" was as incompatible with it in an abstract as in a concrete sense. And it should be remembered that Dr. Doolittle's chapter was written, as Sir John Smale indicates, long before recent questions were raised to warp individual judgment.

But the best and latest authority upon the subject is Mr. E. H. Parker, of Her Majesty's Consular Service at Canton. In a article contributed to the *China Review*, and since reprinted in pamphlet form, this author elucidates all the mysteries of Chinese family law.\* On some future occasion we may refer to the sphere of Mr. Harper's work in its wider scope, and comparatively with Roman, and other, legislation and custom. For the present we only turn to it as an authority on that domestic slavery which, prevailing throughout the whole empire of China, has been adopted into the life of the Chinese residents of a British possession. Mr. Herbert Spencer, on sociology, is quoted by the author. "Wives are brought, concubinage is common among those adequately well off, widows are sometimes sold as concubines by fathers-in-law, and women join in hard work to the extent of being harnessed to the plough; while nevertheless this low status is practically raised by a public opinion that checks the hard treatment legally allowable." This qualification is of importance, of course, but no more a proof of the "benignity" of the system, than would be the self-interested good treatment of slaves by their owners in places where sterner forms of servitude obtain. "The sale of children by parents is common but is invariably confined to young children and to those of the poorest classes." The power of the head of the family could not be more distinctly evidenced than in his frequently exercised right of exposure of his female offspring. The exposure of male infants is rare, for poli-

tical no doubt as well as family reasons, but that of girls is "excessively prevalent in the provinces of Kiang Si and Fuh Kien, and is not by any means unknown in the other provinces, where its frequency varies with the state of the harvest." As regards the power of the chief over the property of his descendants, it appears to "equal that of the earliest Roman father; no limit of age and no circumstances of acquisition seem to deprive the father of the right to appropriate his son's property," a prescription which certainly implies the most complete and permanent condition of bondage, wherein descendants are held by their progenitors. But with reference to more special servitude, while Mr. Parker admits that, so far as his observations go, in no part of China is there anything resembling the shocking condition of the slave in the golden period of Roman history, yet he states that "certain criminals are handed over to the frontier soldiery or to Mahomedans capable of exercising control." The sentence passed upon Yakoo Beg's descendants, who if "criminals" were only so through agnation, will be familiar to our readers, and will serve as another instance of the lengths of cruelty to which one phase of the servitude system in China will allow those who administered its laws to attain. "The Chinese bondsman is *almost* as free as the Roman bondsman, who was *civis* and *liber* in respect of all persons not his master. . . . The code does not provide a penalty for killing one's own bondsman"; but a "bondsman who wilfully strikes his master is punishable with death, accompanied by a slow and painful execution if the blow is fatal." As the whole tenor of Mr. Parker's essay, so far as domestic slavery is concerned, proves how absolute it is and how far from "benignant" are its provisions, we will confine ourselves to two more citations. "Every slave born in a house belongs to his master or his heir; to detain a runaway slave is punishable. Players and brothel-keepers recruit their numbers from this class, as they are forbidden by the code to purchase freemen or women for their professions." . . . "It seems (in the absence of provision) that no slave may accuse any freeman," one of the worst phases of slavery in past times, as the Chief Justice reminds us, in the United States and in slave-holding countries.

And this is the institution for the existence of which, in a British possession and under the protection of British law, apologists can be found. It is surely enough to show thus lucidly what is the real nature of the system which they admire and excuse to display how righteous are all efforts towards its extirpation on English soil, where it cannot possibly be allowed to continue.

#### SANSKRIT VESTIGES IN JAPAN.

THE discovery of Sanskrit Manuscripts in Japan, communicated to Professor Max Müller, and by him made known to the circle of Orientalists, continues to excite attention in Europe. The Professor himself, on the 22nd of March, wrote from Oxford to the *Athenæum* as follows:—

It never rains but it pours. Hardly had I read my paper at the Royal Asiatic Society on the one Sanskrit text, the *Sukharati-vyūha*, which had been sent to me from Japan by the Rev. Shuntai Ishikawa, when the full report of the meeting which you published in the *Athenæum* of February 21st, brought me numerous letters both from scholars and travellers. One of these letters, signed by the well-known initials "H. Y.," appeared in your number of February 28th, and drew attention to the bright sides of Japanese Buddhism, which seemed to have been too much ignored in my paper. All I can say in reply is that I am quite willing to see good in everything; but when the old is better than the new, as it certainly is in the case of Buddhism, surely we should all wish

\* Comparative Chinese Family Law. By Edward Harper Parker, H. M. Consulate, Canton. (Reprinted from the *China Review*). Hongkong: Printed at the *China Mail* Office, 1879.

for a reform, i.e., for a return to the old, original, and simple teaching of the Royal Prince of Kapilavastu.

Among the letters addressed to me on the subject of Sanskrit MSS. in Japan, the most important came from Mr. A. Wylie. He wrote to me on the 3rd of March that he had brought a number of Sanskrit-Chinese books from Japan, and he afterwards kindly sent them to me to examine. They were of the same appearance and character as the Sanskrit-Chinese dictionary which Dr. Edkins had lent me, and as the *Sukharati-ryūha* which I had received from Japan. But with the exception of a collection of invocations, called the *Vagra-sūtra*, and the short and imperfect *Pragñā-hridaya-sūtra*, they contained no continuous texts. The books were all intended to teach the Sanskrit alphabet, and every possible and impossible combination of the Devanāgarī letters, and that was all. Still, so large a number of elementary books, written for the sole purpose of teaching the Sanskrit alphabet, augurs well for the existence of Sanskrit texts.

Nay, there is some evidence now that the Buddhist temples in Japan are still in possession of some of the original palm-leaf MSS. brought from India to China and Japan, of which hitherto no trace whatsoever could be discovered. Among the books sent me by Mr. Wylie there was a second Chinese-Sanskrit-Japanese vocabulary, of which Mr. Kasawara has given me the following account:—"This vocabulary is called 'A Thousand Sanskrit and Chinese Words,' and is said to have been arranged by I-sing, who left China for India 671 A. D., about twenty-seven years after Hiouen-tsang's return to China, and who is best known as the author of a book called 'Nan-hae-ki-kwei-chou'en,' on the manners and customs of the Indian Buddhists at that time. This vocabulary was brought from China to Japan by Zikaku, a Japanese priest, who went to China in 838 and returned in 847. At the end of the book it is stated that in the year 884 another Japanese priest, of the name of Riōyū, copied that vocabulary from a text in the possession of a priest called Yūfukai. This was published in the year 1727, by a priest called Yiankunyo, and it is this edition which Mr. Wylie brought with him from Japan. In the preface to this edition occurs the following highly important passage:—"In the temple Hōriūji, in Yamato, there are treasured *Pragñāpāramitā-hridaya-sūtram* and *Sonsho-āhārāni*, written on two palm-leaves, handed down from Central India; and, at the end of these, fourteen letters of the "Siddha" (the Sanskrit alphabet) are written. In the present edition of the vocabulary the alphabet is in imitation of that of the palm-leaves, except such forms of letters as cannot be distinguished from those prevalent among the scribes at the present day."

Here, therefore, we have clear evidence that the original Sanskrit MSS. were carefully preserved in the temples of Japan, and that so late as the year 1727 palm-leaves containing the text of Buddhist Sūtras in Sanskrit were to be seen in the temple of Hōriūji. That temple, I am told, is still in existence. It is in the town of Tatsuta, in the province of Yamato, near Kyoto, the western capital. Surely it would not be difficult for a native or European scholar in Japan to visit that temple, to explore its library, and to let us know what treasures it contains.

IN a recent number of the English scientific journal *Nature*, Mr. F. V. Dickins reviews Professor Morse's monograph on the Omori shell-heap, in a somewhat carping hypercritical spirit. His statements respecting the ancient history of Japan have already been controverted by Mr. Rugiura, a Japanese resident in London. Mr. Dickins, rather hastily, observes "these mounds consist for the most part of shells little, if at all distinguishable from what are still to be found in abundance along the shores of the Gulf of Yedo." Now, Professor Morse says distinctly that (1) some species have become extinct; (2) some species have changed in form,—and satisfactorily to ascertain this fact alone he must have examined and compared hundreds of shells both from the heap and the sea; (3) the proportions of species have altered, that is, many shells which were extremely common in the heap are very rare along the shore. The solution of questions of this kind alone indicates great work, and is extremely valuable as furnishing links in the chain of evidence required by evolutionists. Mr. Dickins is also in error in thinking the

shell-heap completely swept away; probably the hundredth part has not been removed: in fact its complete removal would be a very serious undertaking. We agree with him, however, in thinking that it would be a great improvement to Professor Morse's book if more drawings of the bones and shells had been given. Clear evidence of a change of level since the formation of the shell-heaps may be obtained, Mr. Dickins says, from the alternate elevations and depressions of the land. He is certainly correct as to the former; but it would interest many to learn where the depressions are to be found. Remains of shell-heaps are common enough, he tells us, in Musashi and Sagami, the two provinces nearest to foreign residents of Yokohama and Tokio, but the fact remains that no one has investigated thoroughly any of these "common" heaps, until Professor Morse saw and described the Omori one. Before his arrival in this country there were doubtless a few dilettante archaeologists who amused themselves by collecting arrow-heads and similar remains, but he was the first to show clearly, and in a most practical manner, that Japan offered a wide field to archaeological students, and most of what has been done by others, since his arrival, is doubtless due to the impetus initiated by him. In the historical portion of his critique, Mr. Dickins has been corrected in London; and, therefore, nothing remains for us to notice as regards that part of the subject, except the ludicrous assertion that the Ainos probably inhabited the whole eastern region of the main island up to the fourteenth or fifteenth century, and the further statement that they probably formed the Omori heap about the thirteenth or fourteenth century. A profound knowledge of Japanese history is not necessary to enable the reader to appreciate the enormous ignorance or utter oblivion which is evident in the proposition of such views as these. Touching cannibalism, his remarks are of the usual description. Gentle and docile people, he says, should not be loaded with such an odious charge, as if we were insulting the Ainos of to-day by saying that, from certain indications, it appears that their ancestors were cannibals a thousand or more years ago. A well-dressed Teuton of to-day would hardly feel offended, when reminded that before the Christian era his ancestors were "not even clothed in a blush." The punishments of the Ainos are known to have been exceedingly cruel; and, in China at least, in the 12th and 13th centuries, they had the reputation of being cannibals. Any one who has seen Professor Morse's monograph cannot help feeling surprised at the excellence of the typography and lithographs, and indeed of the general "get-up" of the work; and Mr. Dickins's sneer on the subject seems a very unworthy one. If Japanese printing offices can produce a work of this description, it is obvious that they have profited well by their teaching, and that they know how to use their foreign machinery. Writing, as Professor Morse did, in part for a foreign public, the statement that the mechanical portion of his book was done solely by Japanese, is surely a most interesting one. In a recent number of *Truth*, the editor, commenting on the establishment of an English review at Rome, exclaims, "English manuscripts deciphered by Italian compositors! The very thought makes one's hair stand on end." What would he say to English, French and German manuscripts deciphered by Japanese compositors? or to the workmanship of the illustrated book we are discussing? It would be difficult to speak too strongly of the general asperity of tone assumed by Mr. Dickins, in criticizing a work on a subject of which he evidently knows little if anything.

THE infamous decoctions sold to unwary sailors in the vile dens so numerous in Yokohama and other ports in the East, are by many people held directly responsible for the

vast majority of those dreadful outrages which, from time to time, send a thrill of horror and disgust through the community. It may easily be realized that, had it not been for the brain-maddening mixture which the wretched man Ross has been proved to have imbibed, his hapless victim would now be pursuing his honourable profession with every expectation of a long and prosperous career. What the particular stuff was which Ross consumed before he committed the crime for which he lies in a felon's cell, is now impossible for anyone to say. But it is some slight evidence of its villainous nature, that the Deputy-Marshal of the United States Court, who smelt the bottle when some of the liquid still remained in it, and who may perhaps be supposed to speak with a certain amount of practical experience, declared that he was unable to decide what the liquid ought properly to be designated. Would it not be worth the while of the Government and the Foreign Representatives to see if by their joint action the crying evil of wholesale adulteration could not be put down with a strong hand? Every State with any real pretensions to civilization has taken steps in this direction with all but uniform success, and why should Japan stand aloof and calmly permit the open sale of abominable and poisonous decoctions, which ruin the health and lead to frightful excess? The care taken to prevent adulteration in Great Britain is interesting in connection with this subject; and to such an extent does the law protect the purchaser from fraud, that, in a recent case, a beer-seller was fined £50 for simply putting sugar in the casks of beer intended for sale.

THE death of the second mate of the American ship *Bullion*, who was stabbed last Sunday morning by one of the crew of the vessel, while it was lying at anchor in this harbour, has raised a question which, although much argued, seems to have really very little in it. The perpetrator of the crime claims to be a British subject, and challenges the authority of the American local court to try him for the offence which he has committed. Ordinarily, of course, no such question could arise, it is only possible in countries where extra-territoriality prevails. On the one hand it is asserted, that an American ship is to all intents and purposes American territory: and that therefore the man ought to be tried by an American tribunal. Against this view it is contended that, as the *Bullion* was lying in Japanese waters, the offence was no more committed in American territory than would have been the case if the vessel were anchored in the Thames and a similar occurrence took place there. Now, as regards the first view of the matter, we fail to realize how anyone can seriously put forward the argument that the deck of a vessel of any nationality lying in a foreign port can be treated as territory of the country to which that vessel belongs. Suppose, for instance, an English ship in New York harbor, or an American ship in the Thames. A fight occurs on board and the combatants shoot and slaughter one another. Will not the local police interfere, and will not the offenders be tried, not before a Consul, but before the ordinary local tribunals, and, if the gravity of the case requires it, be hanged? It is patent to everyone that the answers to these questions must necessarily be in the affirmative, and therefore the contention that an American vessel, in the situation mentioned, is equivalent to American territory is effectually disposed of. It must be borne in mind that, when the Japanese Government, by treaty stipulations, agreed that foreigners should be tried by the tribunals of their respective countries for offences committed in Japan, no territorial rights were ceded except to the extent expressly mentioned. The present case is simply that of a British subject committing an offence within Japanese territory, which would, except for the extra-territorial provisions in the treaties en-

tered into by Japan with foreign Powers, be adjudicated by the ordinary tribunals of the country, in the same way as in the hypothetical cases which we have cited of an English vessel in New York, or an American vessel in the Thames. It resolves itself therefore into a mere question between the British and Japanese Governments, and, under the extra-territoriality provisions in the treaty subscribed by the two Powers, Great Britain has secured exclusive criminal jurisdiction over her subjects in Japan.

#### THE MAIDA BASHI BRIDGE.

(Translated from the *Japanese Scientific Engineer*.)

MORE than one of the old residents now living in Yokohama will probably remember the time when the construction of that stupendous work of architecture, the new Maida bridge at the foot of Hommura road, which has now been completed and opened for traffic, was first begun. From careful observations made by special reporters while the work was in progress we are enabled to give particulars regarding it, which, even to those lacking professional knowledge of bridge engineering, may prove not uninteresting.

For a few weeks after the old bridge was "closed for repairs," everything remained in statu quo, but a policeman in uniform was stationed at either end, undoubtedly to watch that the bamboo fence which had been put up was not interfered with. It was currently reported that the chief engineer in charge was waiting during that time in momentary expectation of important telegraphic advices from the constructors of the St. Gothard tunnel, the builders of the Tay bridge, and various other authorities, respecting new engineering discoveries which had lately been made. After the lapse of the above few weeks we noticed, during a period about equally long, every three or four days a party of what looked like students, having a considerable quantity of tools, instruments, etc., with them, sitting on the bridge. Owing to our limited knowledge of the high flown Tokio dialect which they indulged in, it was only after great trouble and difficulty that we discovered them to be members of the Tokio Engineering Academy who had been sent down to test the relative amount of soundness and rottenness in every piece of timber. Their report which we were enabled after considerable pains to peruse was, however, a very short one and merely said: *Mina mina kusai*. When these students were gone, we again noticed for a number of days a sad and "pensive-browed" man looking at the bridge in what was evidently a state of great dejection and deep melancholy. The indefatigable reporter did not fail to learn that this was the original builder who, upon hearing that the structure was about to be broken up, had asked for a week's grace during which to cast a long lingering look of farewell upon the work of his genius. A temporary passage way, consisting of four bamboo poles and twenty-five one inch boards had, after considerable battling with angry waves, with winds and tides, been thrown across the canal by this time, in place of the ferry-boats which had at first been employed. As the accidents on the new "bridge" with its sharp approaches and its insufficient width of about five feet for the accommodation of both foot and jinrikisha passengers, did not however average more than two or three every hour, a paternal Kencho thought that this should not be allowed to interfere with the original constructor's reverence for antiquity,—a feeling which certainly deserves all due praise. However, even after this week of mourning had expired, it was found that the same sensibility doubtless actuated those who were at last sent to demolish the old bridge, for week after week passed in doing what could have been accomplished in, perhaps, as many hours. The result of a day's work was often nothing more than the loosening of a few boards; and the axe and hammer, coming down more slowly even than the mere force of gravitation would have impelled them to do, generally rested for fifteen minutes or half an hour before they were raised again. We ourselves gradually fell in with the feeling which seemed to reign supreme, and commenced to think that the work was little better than sacrilege in spite of the evident scruples and unwillingness of those who were engaged to do it. However, the continued dropping of water will in process of time hollow out a stone, and as the months rolled on the bridge did at last come down, and only a dreary blank showed the place where it once stood. But then came the

reaction, and we suppose that remorse took hold of those who had been engaged in this act of ruthless impiety, for nothing was done during many weeks, and even when this period was over, the material for the new bridge arrived only sparingly, at the rate of one or two pieces of timber a day. Mechanics and labourers there were always in abundance; but, as far as we could judge, they were chiefly engaged in speculative thinking—very probably in regard to the chances of their children's children still labouring on this fat Kencho job. The summer with its fiery heat and its choking dust had passed into autumn with its cool, delightful breezes. The *fuji* had bloomed and its wealth of white flowers had withered, leaving the bare stems to become dark with envy at the rich foliage of the maple and the wax-bearing *hase*. Winter had succeeded with its cold and storms, and had in turn given place to gentle spring, with its gladdening warmth, calling trees and grasses into new life, and giving to the flowers their bright variegated dresses. All these changes had taken place in nature while the bridge, the great Maida Bashi bridge was slowly approaching completion. As this consummation drew near, it was evident that the feeling of satisfaction which had taken possession of every one connected with its construction, was as effectual a stop to rapid progress as the veneration for antiquity had been at a former period. A carpenter, for instance, who came say, at half-past eight or nine o'clock in the morning, would drive in a nail half-way, then walk around to look at it from all sides, feel it with his fingers, fondle it, pet it, speak to it in endearing terms, etc. Then he would smoke a few pipefuls of tobacco in silent meditation, leaving off only to recommence and again go through the whole performance just mentioned. Drivers and riders would curse in tones both loud and deep at being forced continually to go half a mile out of their way: jinrikisha men, on the temporary narrow passage way, kept on driving over peoples' toes, spilling their passengers and breaking their vehicles, but such trifles did not disturb the serene equanimity of the builders. But at last the day did come when the last plank was laid, and the last nail driven. The Commission appointed by the Kencho to determine the colour of the paint to be used, concluded its arduous labours satisfactorily within twenty-one days. A slight hitch occurred through the action of the experts who were unable to agree whether the approaches to the bridge should be made of wood of stone, of clay, or of gravel. The matter was then referred to the professors of the "Tsurumi Academy for Experimental and Speculative Engineering" who, after much discussion, decided that the approaches should be made of soft mud, a portion of which sticking to the wheels of vehicles would act as a sort of spring, and deaden the shock otherwise caused to the bridge itself.

The opening to traffic—accomplished without any ceremony—took place on the 26th day of April. Everything had been ready a week before; and it was proposed to enclose the space, and to devote this time to a grand public exhibition of the new bridge, at the rate of ten *sen* a head, in aid of the widows and orphans of those labourers who had died while the work was being prosecuted. For various reasons this was found impracticable, and in order to employ the *personnel* as long as possible, they were kept at work during these seven days in removing the fences guarding the approaches, seven or eight bamboo sticks, on an average, being removed each day.

The bridge is now finished and speaks for itself, and further comment on our part would be unnecessary. We can add, however, that to those who have become interested in our description, an opportunity of seeing with their own eyes what we have tried to illustrate, is now offering itself. The Nishi Bashi at the foot of the New Swamp was closed for repairs five or six months ago. During this period the old structure has already been entirely removed, and preliminary arrangements for building a new one will doubtless be completed within a year or two. In all probably the *modus operandi*, even to the minutest details, will be in exact conformity with the course followed in the construction of the Maida Bashi bridge.

#### JAPANESE SKETCHES.

KUWANNON SAMA, ASAKUSA.

THE free, pleasant, joyous out-of-door life in Japan, which always impresses the foreign tourist so favoura-

bly, and which loses none of its charms by repetition, even to the old resident, is seen at its best with the advancing spring. Nowhere in this neighbourhood, or perhaps in the whole country, can it be observed to better advantage than in Asakusa, Tokio, within the grounds belonging to the temple of Kuwannon Sama, more especially on holidays and *feto* days. The Buddhist faith claims nothing of Calvinistic austerity from its disciples; and a religious festival, for all those who can afford it, means a day devoted to innocent pleasure and recreation; and where could this object be better attained than within the venerable precincts of Asakusa? The rotary at the shrines, comes, rings the *kaniguchi*,<sup>1</sup> mumbles a few words of prayer, and drops a couple of cash or so into the contribution box; perhaps, if he is very devout, he will tell his rosary once or twice; but in doing this he has certainly fulfilled all that Kuwannon Sama can reasonably expect of him. Then he looks around to amuse himself, and his pocket need not be lined with anything but coppers to enable him to thoroughly enjoy the rest of the day. The exact status of Kuwannon Sama, in Japanese mythology, is not definitely determined. From what one sees here she might well be taken for the patroness of itinerant showmen and Bohemians of every kind. The caterer for public amusement in the shape of "penny shows" knows full well that, in order to succeed, his exhibition must take a front place within the precincts presided over by the hundred-handed goddess. Apart from immediate results it furnishes a touchstone by which good or bad fortune attending a new enterprise all over the country can be gauged accurately. Success here means success everywhere, failure here, in nineteen cases out of twenty, means that the new show is killed. Every Japanese Barnum of high or low degree naturally gravitates towards this goal. Panoramas, dioramas, and every other kind of 'ramas giving views from all parts of the world; wax figures often fully equal to the best displayed by Madame Tussaud. Menageries, dog and monkey theatres, exhibitions by wrestlers, athletes, clowns, acrobats and jugglers, etc., form the regular attractions, year in and year out. In addition to these no week ever passes but something new and often very *outré* is added to the collection. Quack doctors are everywhere selling nostrums for all possible diseases. One or two dozen photographers seem to drive a brisk trade, and some of them at least are fully in accord with their surroundings. "Walk in Ladies and Gentlemen, walk in!" says a tout at the door. "The chemicals are all ready, the plate is prepared and the light is excellent. We will make your face so good looking that your own mother would not recognize it!" he adds, with a leer to the bystanders, as a party evidently fresh from the country stops before the door. On a late occasion a green looking rustic, listening with open mouth, was bundled into the place, certainly with very little volition of his own, we following as a matter of curiosity. Before the man had recovered from his surprise at this treatment half a dozen sizes of "glass pictures" varying in price from 12½ to 30 *sen* were submitted to him for selection. A bewildered shake of the head was taken as a sign that he wanted the cheaper kinds, or rather the man's looks told the attendant that he was not over-burdened with money. The cloth was taken off the camera, he was made to sit down opposite, being told to keep perfectly still, and in five minutes he was presented with what was in reality a very good likeness, and unquestionably cheap for the money which he was called upon to pay for it. In the rear of the grounds facing the entrance, there are numerous bow and arrow booths (*Yokinha*). The attendants are of the fairer sex and formerly enjoyed considerable reputation all over the city for beauty, brightness and witty repartee. With hardly an exception they have sadly degenerated even within the brief period which limits the writer's experience. Bow and arrow practice is not as fashionable as it has been, and this is sufficient to account for the decline.

To the extreme left of the main entrance to the temple is a very fine garden, forming a charming retreat for an hour or so from the noise prevailing in the other parts. For an entrance fee of two *sen* all the trees and flowers which the season can be made to produce are to be seen in the greatest abundance. From February until the beginning of November, the plum, peach and cherry tree, the wistaria, endless varieties of the calamus or sweet flag, the peony, the chrysanthemum—coming to perfection in the order we have mentioned them—

<sup>1</sup> The gong in front of a temple.

combine with the beautiful foliage to delight the eye of the visitor. The receptacles holding the floral beauties are of themselves well worth close inspection. Immense earthenware jars, six feet wide and nearly as high, down to the tiniest bits of porcelain, show nearly every variety of Japanese faience, and not a few of them are old, rare, and of great value. Half a dozen summer-houses with matted floors are sprinkled over the place; and in addition to the cool, refreshing shade which they offer, the inevitable tea, served by fair hands, is of course not lacking.

The last novelty among the shows of Kuwannon Sama we have found to be an exhibition of the practical working of foreign diving apparatus. A complete diving dress is hung up as an advertisement in front of the booth devoted to this purpose. Upon entering we found a tank about ten feet square and filled with water, let into the ground. The depth was probably also not over ten feet although the cicerone in his explanation made it out to be half as much again. One of the employes who sits there in complete diver's costume with the exception of the helmet, puts on the latter every half hour or so when the booth is full, and descends into the tank. The intervals are filled up by the cicerone with a description of the diving dress, its uses and objects, which taken all in all is done very lucidly and in good style. "We propose to exhibit to you," the speaker commences in a grandiloquent way, "something different from the ordinary line. This is no dog or monkey show where you spend your time uselessly and purposely; we offer you instruction even more than amusement. Here is one of the wonders of the inventive skill of foreigners. By means of it the diver can descend with comfort and safety to the bottom of the sea. He can bring up money and valuables, and he can cause cannons and even whole ships that have been sunk, to be recovered. He can stop down there for hours; can if he desires to do so take a nap, hug the mermaids and repose among the water nymphs." All the different parts of the apparatus; the helmet, the jacket, the drawers, the shoes, the air pump, the signal line, etc., are commented upon so as to make their object and purpose clear to the dullest understanding. When the man has descended into the water, the visitors are requested to try him by throwing in any small articles they wish to be recovered, an invitation which was readily responded to, the objects generally being fractions of a cent which, upon the diver emerging, are duly shown for verification—but not returned. They are the perquisites—perhaps the sole pay—of the assistants.

The greatest attraction to the foreign visitor is always, of course, the living throng which, especially at this time of the year, fills all the places where amusement can be found. How happy every one looks, how fully and freely alive and responsive to every appeal to sight or hearing. A glance is sufficient to prove the utter want of affectation, the thoroughness with which each separate individual yields to the impression of the moment. No *arrière pensée* of regret and sorrow for the past or of care for the future, mars the present enjoyment. If Japanese hypochondriacs exist they certainly do not show themselves in public, but keep their sorry misery to themselves. A foreigner of the class which affects the *nil admirari* style is as much out of place here, as a bull in a china shop. The influence of foreign intercourse and the changes which it produces on the conditions of life, both as regards the nation and the individual, will doubtless in time mould the character of the people, and cause it to lose that quality of easy forgetfulness of all cares and troubles which now distinguish it. That it should be altogether eradicated is neither to be expected nor to be wished for; and a goodly share of that elastic, buoyant spirit which is so productive of individual happiness will, we trust, always be the birthright of those whose home is the Land of the Rising Sun.

#### CORRESPONDENCE.

[Our readers must distinctly understand that we are in no sense responsible for the sentiments or opinions of our correspondents, for the accuracy of their assertions or for the deductions they may choose to draw therefrom.]

TO THE EDITOR OF "THE JAPAN WEEKLY MAIL."

DEAR Mr. Editor.—On page 557 of the *Japan Weekly Mail*, May 1st, 1880, in a report on a meeting of the Seismological Society, I find the following passage:—"Mr Ewing described an instrument for measuring the intensity of earthquakes which he claimed to have invented. A discussion followed, in which the chief question seemed to be whether a heavy weight,

suspended at the end of a long, thin wire, was affected by the motion of the earth's surface or not."

I beg to state here, that in August, 1878, in the 15th vol. of the Transactions of the German Asiatic Society, I have published a long paper explaining the principle referred to in the above passage, and proposing for the measurement of the intensity of earthquakes a new Seismometer, composed in its main part of a heavy weight suspended by a string, and in its second part of some sort of indicator moving or hitting against this weight, when an earthquake shock occurs. And in May, 1879, in the 17th vol. of the said Transactions, Mr. Knipping published the first record of observations made with such an instrument, and gave the intensity of the earthquake shocks from the 26th of November, 1878, until the 26th of February, 1879.

In case Mr. Ewing's claim of invention should refer to the above principle, I would feel very much obliged if you would kindly tell me through what published document or public lecture Mr. Ewing can authenticate his claim of invention. The only information I know of which seems to refer to Mr. Ewing's apparatus, is a passage in a letter on earthquakes published by the *Japan Gazette* of December 13th, 1879; the writer speaks of a "newly designed instrument, which cannot be minutely described, &c., &c." I need not say that I am ready to immediately withdraw my claim for having been the first to establish this principle of a Seismometer for indicating, as well as for measuring the intensity of earthquakes, as soon as anybody else can authenticate his priority. As to the indicating part of Mr. Ewing's Seismometer, I have not the slightest objection to his claiming as much right of invention as he likes.

Hoping that you will be able to fulfill my request,

I am,

Your's respectfully,

Dr. G. WAGNER.

Kioto, May 9th, 1880.

#### REUTER'S TELEGRAMS.

FROM THE HONGKONG "DAILY PRESS."

London, 1st May, 1880.

The *Tamaga*, Portuguese war-vessel, is ordered to Macao.

#### THE NEW MINISTRY.

Mr. Joseph Chamberlain has been appointed President of the Board of Trade, with a seat in the Cabinet.

Mr. Fawcett, to be Postmaster-General.

Earl Cowper, to be Lord Lieutenant of Ireland.

[Mr. Joseph Chamberlain is a new man, an advanced Liberal. He was formerly a partner in the firm of Nettlefold and Chamberlain, the great screw monopolists, but retired about six years ago in order to devote himself to politics. During his brief but brilliant public career, which commenced about twelve years since, he has been thrice Mayor of Birmingham, Chairman of the Birmingham School Board, and was elected member of Parliament for Birmingham upon the retirement of Mr. George Dixon, in 1876. Mr. Chamberlain has been highly educated, and is a man of culture and refinement. He is about 44 years of age, but appears much younger, having a very juvenile appearance. He is an influential member of the Church of the Messiah (Unitarian), Birmingham, a congregation distinguished alike for wealth and benevolence, and is immensely popular with his fellow townsmen. His rapid rise in Parliament was confidently predicted when he first entered St. Stephen's, and we are not surprised to find him included in the new Cabinet.—Ed. P. D.]

London, 6th May, 1880.

The Right Hon. G. J. Goschen has been appointed Ambassador at Constantinople during the absence on leave of Sir Austen Layard.

London, 12th May, 1880.

The search for the training-ship *Atalanta* has proved fruitless.

All the recently appointed members of the Ministry who

had to appeal to their constituencies have been re-elected, except Sir William Vernon Harcourt, Home Secretary, who was defeated.

### NOTICE TO CORRESPONDENTS.

No notice will be taken of anonymous correspondence. Whatever is intended for insertion in the JAPAN WEEKLY MAIL must be authenticated by the name and address of the writer, not for publication but as a guarantee of good faith.

It is particularly requested that all letters on business, relating to Advertisements, Job-printing, or Accounts, be addressed to the MANAGER.

And that literary contributions of every description be addressed to the EDITOR.

YOKOHAMA: SATURDAY, MAY 15TH, 1880.

JAPANESE ERA 2540, MEIJI 13TH YEAR, 5TH MONTH, 15TH DAY, DO-YO-RI.

During the past week we have not received any European despatches. The steamer *Harter*, which arrived last evening from Hongkong, brought forward the Indian mails. The *City of Tokio* left for San Francisco on Thursday last at four p.m., and was followed the next day by the M.M. steamer *Tanais* for Hongkong.

Prince Henry of Germany has been received with profuse welcome in Hongkong where, at the date of latest advices, he was the guest of Sir John and Lady Hennessy at Government House.

The Portuguese "fleet" in Chinese waters, which for a long time consisted of a solitary gun-boat, the *Tijo*, is already, or will shortly be reinforced. The *Tijo* is to be relieved by the *Mindori*, a new vessel of the same class, whose building in England was only completed this year. The *Tamaga*, another gun-vessel, is also said to be on her way from Europe to Macao; and it is probable that one or more of the powerful corvettes lately acquired by the Portuguese navy will follow. These movements have no doubt reference to the recent claim put forward by Portugal to the absolute possession of Macao, a port which, there is no question, would attain temporary importance in any struggle between China and a European power.

The foreign community of Yokohama is so peaceful and law abiding, and crimes of violence are of such extremely rare occurrence, that a thrill of horror was felt on the 10th inst., when it was bruited abroad that a dreadful tragedy had occurred on board the American ship *Bullion*. The rumour unfortunately proved only too true. Robert Kelly the second mate of the vessel, had been stabbed by one of the seamen named Ross, and died from the effects of the wounds inflicted upon him. Intelligence of the dreadful affair was at once sent to the consulate and the prisoner handed over to the custody of the consular officers. The deceased was an Irishman about twenty-eight years of age; Ross, his assailant, is a Canadian of the same age as his victim. A full report of the Inquest will be found on page 640.

William Drinkolle, the second mate of the *Centennial*, has been found guilty of murder in the first degree and sentenced to death. The Hon. J. A. Bingham, U. S. Minister, has deferred for the present the issue of the necessary warrant of execution, pending reference to the President.

During the prevalence of cholera last autumn the local authorities, in deference to the wishes and convenience of residents on the Western Bluff, ordered that the process of resolving the dead to ashes should only be effected after midnight. Cremation is still frequent at Negishi, and the burning is effected in the rudest conceivable manner. The corpse, contained in a frail box, is placed upon a furnace which consists of three stones laid on the ground. A fire is lighted beneath, around and over the body, and is not too carefully or systematically replenished; and as the work of reduction, which occupies several hours, is performed in the open air or in sheds accessible to the four winds, all the villanous and offensive processes of combustion are thrown off into the atmosphere. A westerly wind such as was blowing on Sunday, will frequently

waft to the houses situated at the race-course end of the upper settlement, the most indescribably disagreeable odours, the effect whereof is naturally intensified upon those who are not in blissful ignorance whence they arise. It would be well if the order that incineration shall only commence at midnight, were made permanent. But a still better course would be for the sanitary bureau to hasten the completion of properly constructed pyres where the consumption of bodies of the dead should be rapid, entire, and inoffensive. The health officers are in possession of plans for the construction of cheap and effective incinerating ovens.

The return match between the new and the old members of the Yokohama Cricket Club was played last Saturday afternoon the younger members gaining, as in the former conflict, an easy victory, in a game which was confined to two innings on each side. The scores are as follows:—

The regard in which the late Mr. W. E. Clark was held by the fraternity of which he was a prominent member was shown by the extraordinarily large number of Masons who assembled to pay, with full solemnity, their last tribute to his memory. The procession was probably the largest yet organized by foreigners in Yokohama. Many of the non-Masonic friends of the deceased were also in attendance at the grave yard.

The United States frigate *Ticonderoga*, flying the flag of Commodore Shufeldt, arrived in Yokohama on Tuesday, after an interesting cruise. She sailed from Hampton Roads, Virginia, on the 7th of December, 1878, and after rather a rough passage arrived at Madeira on the 24th of the same month. After touching at the Cape de Verde Islands she reached Sierra Leone on the 15th of January, and left on the 11th of the following month. Roberts Bay, Cape Mount, in the territory of the negro republic of Liberia was next visited. A hydrographic sketch of the harbor was made, and the base of a future survey was arranged. From Monrovia, thirty-eight miles from Cape Mount, an expedition was made into the interior, after which Cape Mount and Sierra Leone were returned to. Touching at Fernando Po, the Gaboon and St. Paul de Loando, the *Ticonderoga* arrived at St. Helena on the 21st of June, and remained until the 19th of July. Cape Town was reached on the 1st of September. Coasting the east coast of Africa, and touching at ports in Madagascar and on the main land en route, the vessel came to Aden towards the end of the year. Thence to Muscat and other places in the Persian Gulf, before proceeding to Bombay, which was reached on the 12th of January last.

Point de Galle, Penang and Singapore, Manilla and Hongkong, were respectively visited on the way to Nagasaki, where the *Ticonderoga* arrived on the 14th of April, remaining until the 3rd of May when the vessel crossed to Corea. Arriving at Fusan on the 4th the steamer remained till the 6th only, when she sailed for Yokohama direct. No overt attempt was made to enter into political relations with the Korean authorities; and the natives displayed no willingness to have intercourse with the strangers. The Japanese Consul and settlers were very polite and obliging. On Wednesday Commodore Shufeldt visited His Excellency Mr. Bingham. Mr. W. P. Mangum, American Consul at Nagasaki, has been on board the *Ticonderoga* since she left that port. The usual salutes were fired on the arrival of the steamer. We subjoin a list of the officers on board—R. W. Shufeldt, Commodore; lieut. D. P. Mannix, U.S. M. C., Aid and Secretary; ensign F. F. Fletcher U. S. N., Aid; B. J. Cromwell, commander; E. W. Sturdy, H. L. Tremain, F. J. Drake, and Kossuth Miles, lieutenants; C. E. Vreeland, master; W. S. Hughes, H. H. Hooley, and D. Daniels, ensigns; H. M. Wells, surgeon; R. A. Urquhart, P. A. surgeon; W. J. Thompson, paymaster; J. R. Rosse, paymaster's clerk; F. G. McKean, chief engineer; Saml. Gragg, J. P. Mickle, G. W. McElroy, and J. R. Wilmer, engineers.

The following table, compiled from native sources, shows the number and circumference of the lakes in Japan.

The ri is about 200 feet less than 2½ miles.

"Atlas" in the *World* says that "Young ladies who promise one and the same dance to two or more gentlemen have sometimes a good deal to answer for. The other day at a certain ball in Dublin an instance of the kind occurred. Two gentlemen claimed a young lady for a dance promised to each of them as their programmes proved. Neither would resign his claim; and on the lady making her selection, the rejected candidate called his successful rival a cad. The epithet provoked a blow, which the lady, acting as peacemaker, received on her eye and nose, causing the latter organ to bleed profusely."

We are informed that the object of the Prussian bill prohibiting foreign vessels from engaging in the coasting trade of Germany, except under a treaty, is to enable the Government to make reprisals against Russia and the United States, which refuse this privilege to foreign ships.

A distinguished physician was in the habit of recommending his patients to live out of doors as much as possible. He used to say:—"It is good for the health, and however bad the air may be out of doors it is always worse in the house. It is good for the temper. People who are always shut up in a house are apt to grow fretful and peevish. They are prone to acquire narrow views of things, and to worry over trials not worth considering. It is good for the whole character—for strength, hope, patience and fortitude. It expands and softens one's nature and makes us more charitable."

An amusing writer dilating upon the difference between a hungry man and one who has satisfied his appetite, gives the following example in support of his theory:—"A business man who has been at work all day will enter his house for dinner as crabbed as a hungry bear—crabbed because he is as hungry as a hungry bear. The wife understands the mood, and, while she says little to him, is careful not to have the dinner delayed. In the meantime the children watch him cautiously, and do not tease him with questions. When the soup is gulped, and he leans back and wipes his mouth, there is an evident relaxation, and his wife ventures to ask for the news. When the roast beef is disposed of, she presumes upon gossip, and possibly upon a jest; and when, at last, the dessert is spread upon the table, all hands are merry, and the face of the husband and father, which entered the house so pinched, and savage, and sharp, becomes soft, and full and beaming as the face of the round Summer moon."

Much credit must be given to Mr. Plimsoll for his unwearied exertions in the cause of those "who go down into the sea in ships." Incidents like the following revolt every well constituted mind. "The Wreck Commissioner, Mr. Rothery, on Tuesday the 18th of March concluded an inquiry into the loss of the ship *Marlborough*, which left Cardiff for Genoa on the 29th of last November with a crew of twenty-five hands and a cargo of coal, and had never been heard of since the pilot left her. The owner of the vessel, Mr. Garbutt, admitted that the vessel was undermanned, but urged that this was the result of an error of judgment, and that he had no desire to lose the ship, by whose disappearance he had lost £6,500. The court held that the vessel was unstable, that the load line had been altered, and that the ship was overladen and undermanned, with the knowledge and sanction of the managing owner. Looking at the gross carelessness and loss of life occasioned by it, the court ordered the owner to pay £250 costs." Ten pounds, say \$50 per head, for each man lost through the "gross carelessness" of the man who remained safe on shore! Walters the forger, received twenty years penal servitude; Mr. Garbutt, a trivial fine of £250 for sending to sea an unstable ship, overladen, undermanned and with the load line altered. But then property was at stake in the one case, and only the lives of common sailors in the other.

The lively correspondent of an English paper finds food for gossip in the proposal to alter the present marriage laws. He says:—"The renewed activity of those who are for and against the legalisation of marriage with a deceased wife's sister reminds me that the question whether a man may marry his divorced wife's sister has never yet been mooted. The divorced lady may be married to some one else, and so certainly have lost all kinship to her former husband. Does nevertheless that kinship continue to adhere to her sister? A wife's sister living with her and her husband, secretly in love with the latter, and instigating her to commit imprudences which would lead to a legal separation, and enable her to gain her desire: there is a plot for a comedy!—a French comedy, of course, after the passing of M. Nacquet's Bill of Divorce."

On the 2nd of May, says the *Daily Press*, telegraphic communication between Hongkong and the Philippines was completed, and the first message flashed through the new cable. The final splice in the cable connecting Hongkong with Cape Bolinao was made, we learn through the courtesy of the Superintendent, last Thursday. The results of test are very satisfactory. Congratulatory messages were exchanged by Their Excellencies the Governor-General of the Philippines and the Governor of this Colony. They are as follows:—

"Manila, 2.35 p.m., 1 Mayo, 1880.

"EL GOBERNADOR-GERENALE AL GOBERNADOR DE HONGKONG.  
"Al comunicarme directamente con V. E., cumplo un deber muy grato felicitandomi por ello le doy gracias por su eficaz cooperacion."

[TRANSLATION.]

Manila, 1st May, 1880.

THE GOVERNOR-GENERAL TO THE GOVERNOR OF HONGKONG.  
In communicating directly with Your Excellency, I fulfil a very pleasing duty in to-day congratulating you and returning thanks for your valuable co-operation.

GOVERNOR HENNESSY

TO GOVERNOR-GENERAL OF THE PHILIPPINE ISLANDS.

"I heartily congratulate your Excellency. The communication now opened will still further increase the commerce of Manila and Hongkong and be an additional guarantee for the friendship of Spain and England."

The line is now opened to the public, and the charge for telegrams from Yokohama to Manila is \$1,575 per word.

Dotheboys Hall was not such a creation of Dicken's imaginative powers as many might feel inclined to think. He was threatened with several actions by school-masters who considered themselves alluded to, and the following extract from the *Pall Mall Gazette* shows that a female representative of poor "Smike" was recently discovered in Kent. "Emily Scott, the mistress of a boarding-school for boys at Hastings, was charged on remand on the 18th of March with neglecting to provide sufficient food and clothing for her servant, aged fourteen. The master of the workhouse stated that when the girl was brought to the infirmary she weighed only 35 lb.; but that eight days afterwards, having been properly fed, she increased 8 lb. in weight. Miss Scott told him that two years ago she advertised for some one to help her, and a man brought the girl and paid a sum of money. When asked what she had given the girl to eat, she replied, 'Porridge mixed with cod-liver oil.' It was stated that the girl was not in a fit state to give evidence, and the case was further remanded, bail being accepted for the prisoner. She was driven to her home in a cab. A mob followed to the house, but was dispersed by the police."

A recent London paper says that "a young lady who is the belle of a certain suburb not 100 miles from Charing Cross, and is renowned not only for her charming figure and exquisite taste in dress but also for her grace and skill as a skater, was fascinating a host of admirers and maddening with jealousy a host of rivals by her feats upon the ice, when she suddenly stumbled and fell. A score of chivalrous gallants sped to the rescue, but before one of them could reach her she had regained her feet. She was wearing a Canadian skating costume. It unfortunately happened in this case that in endeavoring to save herself the lady ripped her stocking with the point of her skate. She was not however, aware of the mishap, and glided away from her rescuers with her usual graceful rapidity. As she sped along in conscious triumph a strange sound reached her ears, ominously like suppressed laughter. She cast a quick glance back, and I leave you to imagine her feelings when she saw that her course was marked by a long trail of sawdust. The shapely limb to which the wounded stocking belonged was fast losing its symmetry, and the secret of its shapeliness stood revealed. Enough; I will draw a veil over her blushes. But I doubt whether she will skate much in public near London this winter."

The discomfort of railway travelling in winter may be greatly reduced by the carriages being properly warmed. A French paper contains an account of a new method of attaining this desirable end, which, if all that is reported of it be true, would seem admirably adapted for use here in Japan. The journal in question says that "it is reported from Lyons that the Compagnie Paris-Lyon-Méditerranée is now trying a new method of heating in express trains. The method was proposed by M. Ancelin, an engineer, and consists simply in the use of acetate of soda in the foot-warmers. The substance has considerable latent heat; dissolving at a certain temperature, it thus absorbs a large quantity of heat, which becomes sensible during crystallization in cooling. All that is required is to fill the ordinary cases with a sufficient quantity of the acetate, close them, and place them in a stove at about 100 deg. The cooling of a case thus charged and heated takes 12 to 15 hours.

The warmers are thereafter taken from the compartments and placed in a stove (where the crystals of soda acetate are re-dissolved); they are then ready for fresh use. The advantages of such a system are obvious—no necessity of changing warmers every two or three hours, or of maintaining a numerous body of men at stations to attend to them; economy in cost of heating, &c. Moreover, most of the existing foot-warmers can be utilized. Acetate of soda is not very expensive, and it could easily be manufactured in much larger quantities than at present if the demand required it. The new system has been tried on the express train No. 5, leaving Paris at 7.15 and reaching Perrache at 4.31. The compartments were each supplied at starting with two warmers containing acetate of soda. At Perrache most of the warmers were still so hot that one could not apply the back of the hand to them. From Lyons to Marseilles the train was heated on the ordinary system."

The blatant Biggar, in one of his recent flatulent addresses to the free, independent and enlightened electors of Bally—something or another, asserted that Ireland, if necessary, would produce another Hartmann. England, however, has anticipated Ireland by producing a desperate Nihilist. We read in a recent London paper that through the activity of E 300 of the London police force, an outbreak of Nihilism in England has been suppressed before it became dangerous to the State. On Saturday night, the 6th of March last, High Holborn was thrown into a state of excitement, it may perhaps be said alarm, by the conduct of a Mr. Wilson, who had hitherto led an unblemished life as a citizen and ratepayer. Rushing into the midst of that busy thoroughfare, Mr. Wilson denounced the institutions of the State in the strongest and most forcible language. He proclaimed himself an "English Nihilist" and added that his mission was "to exterminate the police force." He denounced E 300 as "a scoundrel who had been kept going out of the taxes," and finally became so riotous and unmindful of the respect due to the "cloth," that the long-suffering policeman was compelled to remove him to the nearest lock-up, and tranquillity once more reigned in Holborn. When he was brought before the Bench, this English successor of Nobiling, Solovieff & Co., had lost all his former fierceness, and candidly explained that his devotion to Nihilism was the result of an unknown quantity of brandy and water. The magistrate fined him 2s.—that being the exact amount of coin in his possession—and the "incident" was closed by the desperate rebel returning quietly to his home.

When the expense of maintaining a youth at one of the German Universities is considered, it is really extraordinary that those institutions are not more largely taken advantage of by that very considerable portion of the English middle-class, who have only extremely limited incomes on which to live in decency and educate their families. From the following table, taken from the *Economist* of the 20th of March last, it would actually appear that the average expenses of the students in the University of Heidelberg, is less than the average cost of maintaining a boy in one of the charity schools in England! The table gives the results for the years 1871—78, and the growth within the limits of time referred to is remarkable. It suggests the notion that increased extravagance, as well as increased cost of living must have influenced the figures of the later years:—

Year.	Number of Students.	Average Expense per Student.
1871 .....	601 .....	£ 30 15
1872 .....	900 .....	24 8
1873 .....	880 .....	26 14
1874 .....	884 .....	43 11
1875 .....	790 .....	58 5
1876 .....	795 .....	70 9
1877 .....	834 .....	55 17
1878 .....	850 .....	68 16

The intelligence of the death of the blood-thirsty King of Burmah from the effects of small-pox, is confirmed by late Indian journals. It appears that on Theebaw falling ill, propitiation to the spirits was made in the form of human sacrifices. This went on nightly for upwards of seven days or until the brutal monster had himself ceased to exist. The unfortunate victims of his cruel superstition were principally young

girls, over one hundred of whom were slaughtered. Not long since, on the occasion of the illness of Theebaw's son, a great number of infant children were buried alive.

We observe that the unsightly bamboos lately nailed along the posts on the sea face of the Bund are in course of removal, and that chains are being attached to the posts as formerly. It is to be hoped that the police will, by increased vigilance, prevent any further thefts of the chains.

An extraordinary action was tried recently in London. The plaintiffs were jewellers, carrying on business in St. James's-street, and the defendant was Mr. Henry Bruce Meux, only son of Sir Henry Meux, who was pronounced a lunatic in 1858. After reading the version of the transaction given by the plaintiffs' counsel, the thought at once suggests itself, why the only son is not sent to keep company with his father? Certainly no man in his senses would think of spending nearly £14,000 in jewellery, in the course of about nine months. The question before the court was the liability of defendant for £3,459 the balance of plaintiffs' account. The defendant alleged that £442 only remained due and the matter was postponed.

A recent English paper mentions that a letter from Cabul states that the European troops are terribly badly off for boots. They are nearly bare-footed, and the few who are able to get boots are obliged to pay fabulous sums for them. Our contemporary remarks that under the circumstances, the private soldiers should be supplied with extra boots at the expense of the Government, or at all events should be furnished with them at English rates. It is alleged that one officer was in such extremities that he offered another officer who was returning to India £20 for a pair of boots: but the offer was declined, the officer returning to India having but one pair of boots himself.

The past season has been very severe in the Caucasus, and the intense cold drove vast quantities of game from the mountains into the province of Erivan. Wild geese were so plentiful that the peasants knocked them down by dozens in the fields, and a brace of partridges, pheasants, or ducks could be had anywhere for sixpence. The officers attached to the garrison at Erivan had excellent sport with wolves and foxes during the season, one lucky fellow accumulating as many as 700 fox-skins as trophies.

As Mr. James Russell Lowell now holds the most important foreign mission of the United States of America, the following lines from "The Biglow Papers" are quoted to show his earlier views on the subject:

"I du believe 'tis wise an' good  
 Tu send out furrin missions,  
 That is on sartin understood  
 An' orthodox conditions—  
 I mean nine thousand dolls. per ann.,  
 Nine thousand more for outfit,  
 An' me to recommend a man  
 The place would just about fit."

A New Zealand journal describes how two sisters, on a visit to a large house near Wanganui, were sleeping together in a room upstairs. During the night one of them had toothache, and descended to the kitchen *en dishabille* to procure something to alleviate the pain. She returned to the bedroom, and exclaiming, "Oh, it's so cold," jumped into bed. The exclamation aroused the occupant, who proved to be, not her sister, but a male sleeper. Now in the *Decameron* or *Faust* the incident would probably be left at this point, but the New Zealand journalist is too conscientious for that. He describes how the poor girl discovered her unfortunate mistake. The sleeper turned over, and thinking a burglar was in the room, caught hold of her. She managed to escape, but not before his rough handling had scratched her face. She related the circumstance to her sister, and to hide from the gentleman which of the two had been his unwilling guest, both ladies appeared with a strip of sticking-plaster on her cheek! This amiable confusion of the issues is worthy of the creator of the *Dromios* and the two *Antipholi*.

#### SANITARY REFORM IN JAPAN.\*

The recent epidemics of cholera have aroused such a widespread interest in the subject of sanitary reform that there is no need for me to give reasons for bringing that subject before you. But you may perhaps wonder that one should come forward to talk about sanitary matters, who is not a doctor, and who makes no pretensions whatever to medical knowledge. Sanitary matters do not however belong to the medical profession alone. Doctors tell us what conditions of living are healthy and what are unhealthy; but they cannot always tell us how we are to secure these conditions. Doctors tell us that amongst the conditions of health none are more important than a liberal supply of pure water and pure air, and the speedy removal of filth and unnecessary water from the neighbourhood of our dwellings. But water-supply, and ventilation, and sewerage are engineering subjects, requiring for their successful treatment the sort of skill and knowledge which are possessed by engineers, and not by doctors, unless they happen to be engineers as well. Sanitary engineering is the name given to that department of engineering which deals with these matters. It must be studied and put in practice before we can surround ourselves by those appliances which are proved by medical science to be essential to health. The engineering aspect of sanitary reform in Japan has not yet received the attention it deserves. Notwithstanding all the recent progress in medical knowledge and scientific knowledge generally which Japan has recently made, and notwithstanding the labours of the Sanitary Bureau and the Board of Health, there is as yet little if any improvement in the water-supply or in the drainage of towns and villages. I use this word drainage in its widest sense, meaning by it all actual or possible methods of disposing of refuse matter, or any matter which is prejudicial to health if not removed.

Thanks to modern medical knowledge, the sanitary engineer knows very well what objects his work should aim at attaining. For instance he knows that in supplying a town with water he must select a source of supply which is pure, and distribute it in such a way that it shall remain pure—especially so that it shall be kept from becoming mixed with even the smallest quantity of sewage or other kinds of filth which accumulate where people are gathered together. Observations of actual cases where certain diseases have spread through communities have shown that in many cases the impurity of the water was the cause. If for example some of the matter discharged by a person who has cholera is allowed to get into a well, many will become infected with the same disease. Medical men agree in telling us that of all influences which tend to spread diseases, especially those diseases which are called epidemic, there is no cause more powerful than an impure water supply. On this point let me quote the words of Dr. Simon, the late medical officer of the English Privy Council, and a very high sanitary authority. He says:—

"Nor only is it now certain that the faulty public water supply of a town may be the essential cause of the most terrible outbreaks of cholera, typhoid fever, dysentery, and other allied disorders, but even doubts are widely entertained whether these diseases, or some of them, can possibly attain general prevalence except where the faulty water supply develops them."

I could give you many instances where it has been proved beyond the possibility of doubt that epidemics of cholera and typhoid fever have been caused by bad water. It is now so generally recognised that outbreaks of typhoid fever are due to purely preventable causes, that whenever a considerable one occurs in any district of England, a sanitary officer is sent to find out, if he can, by what means the disease has been developed and spread. For instance, there was a violent outbreak of typhoid fever in the town of Guildford in 1867, and a sanitary officer was sent to investigate the cause. He found that water from a newly opened well had been supplied to three hundred and thirty houses for one day and one day only. Eleven days later typhoid fever appeared in these houses although they were situated in a healthy locality. Altogether, five hundred cases of the disease occurred. All except three of these persons had drunk the water from that particular well on the one day during which it was open. It was afterwards found that sewage from a leaky drain had become mixed with the water in that well. You see that a very large proportion of the people who drank it became ill, but almost all those who did not drink it escaped. It is easy to account for the three other cases, by supposing that they derived the infection from some of the other sick persons. We have therefore most conclusive evidence that bad water—water polluted by sewage—was the cause of this outbreak of disease.

There is also every reason to believe that air which has been tainted by contact with the emanations from persons suffering from such diseases may cause the disease to spread. In many western cities the sewage is carried away from houses by means of a vast system of sewers and drain-pipes connected to every

\* A lecture delivered to the students of the University of Tokio on April 24th 1880, by Professor J. A. Ewing.

2 In his report for 1869.

house. Very often it happens that, on account of faulty appliances, the gas which is formed by the decomposition of the matter in these sewers is allowed to pass back into the houses, where it is of course breathed by the inhabitants, and where also the poisonous particles which it contains may be deposited in articles of food or drink, and taken into the body in that way. This danger has been found to be practically a very great one. Many cases have occurred where typhoid fever and other diseases have travelled along a street from house to house, carried by the deadly sewer-gases; and only those houses have escaped whose owners had used the proper means of connecting them to the drains, or in such a manner that the gas could not pass back into the houses.

The observed facts about the spread of infectious diseases have led medical men to form the opinion that they are in many cases at least due to certain definite poisonous particles being received into the system. These are given off in very large numbers in the excreta and other emanations from the diseased person. These particles, which are so small that we cannot see them even with a microscope, are generally believed to be actual living germs, possessed of organic life and ready to propagate with enormous rapidity whenever they reach a soil adapted to their growth. If a few germs or seeds—or perhaps even one germ only—be received into a favourable part of the system of a healthy person, they will develop there and produce the disease of which they are the germs. Cholera for example has, it is believed, its own definite germ, which must be present before that disease can be produced. If a few drops of the excrement discharged from a cholera patient become mixed with drinking water, they will scatter a multitude of germs through it, making it a possible source of infection to scores of people.

Many of you are perhaps already familiar with all that I have been saying just now, for these are the most elementary principles of sanitary science; but I hope such persons will excuse me for the sake of others who may not be so well acquainted with these fundamental truths. The ancient Hebrews, Greeks and Romans must have known and appreciated the importance of the subject, and indeed the remains of great sanitary works executed by them show us that sanitary engineering was one of the foremost of the early arts. But in the dark period of the Middle Ages this knowledge was lost. The sanitary state of the towns and villages of Europe was then so bad that we can hardly believe the accounts which historians give us as to the manner in which the people lived. They allowed the dirt to accumulate round and even in their houses, so that the very floors were caked masses of filth. Dirty habits were considered to be a mark of goodness: they were taken as showing that men did not care too much for their own comfort. Thus one character was specially praised who combed his hair only once a year, and never washed his clothes at all, but let them fall to pieces by rotteness. This state of things brought its natural consequence. Plague after plague swept over Europe, and even in the intervals between the plagues men died faster, in the purest country air than they now die in the most pestilential lanes of our towns.<sup>3</sup> Later, when science revived, sanitation continued for long to be one of the lost arts. From 1660 to 1680 the average number of persons who died each year in London was 80 in every 1000 of the population. During the next ten years it was reduced to 42.<sup>4</sup> Now-a-days the number is about 22, thanks to sanitary reform, and in England at least the state of things has so much improved that a great epidemic seems to be impossible. Of late years sanitary reform has advanced with rapid strides and its effects are shown very clearly by the diminished rate of mortality which has followed it. In English cities where sewerage-works and water-works on the most approved principles have been carried out, the death rate has declined about 25 per cent., that is to say the number of deaths each year out of every 1000 people is only about three-quarters of what it was before the improvements were made. And this change has taken place quite suddenly, proving that it is really due to the sanitary works.<sup>5</sup> Of course the great difficulty in carrying out such works is their cost. Where lives are saved and disease is avoided we cannot strike a balance between the advantages gained and the outlay, for the two things are not in their nature comparable. But a very interesting and valuable calculation has been made, which shows that, even if we think of nothing but the financial aspect of sanitary reform, it more than repays its cost. The lengthening of life and the prevention of disease have their money value, for they represent so much time gained during which a man can labour. Taking the statistics furnished by an actual town which adopted extensive and costly reforms, Mr. Baldwin Latham, a distinguished sanitary engineer, has made this calculation, and shown that in twenty years the saving effected amounted to nearly double the original cost of the works. To look upon life as a mere matter of so many *yen* a year is not to take a high

view of it; and we may certainly say that this way of measuring the value of sanitary improvements leaves many of their advantages out of the reckoning, but still it gives a sufficient answer to people who object to these improvements because of their cost. Even financially they are a gain to the community, not a loss.

Let us turn now from this introductory matter to the main subject of my lecture;—to the question, whether the present state of sanitary matters in Japan is satisfactory or even tolerable.

I think the question admits of only one answer. The present state of things is not satisfactory, nor even tolerable, and in view of the earnest desire for improvement which is now manifesting itself, I am sure it will not be tolerated long. It is indeed much better than the state of things which I have spoken of as existing in Europe in the middle ages; but it has been stationary while western nations have been going forward, and now it falls vastly short of the modern ideal. Both in regard to water supply and sewage the present state of things in Japan is excessively bad, and everywhere conditions are present favourable to the propagation of epidemics.

Let us consider the water supply of Tokio and its suburbs. In that there are two distinct methods. The outlying and higher parts of the city get water from natural wells sunk in the soil. The supply in most of the lower parts of the city is given by means of a great system of wooden pipes which receive water chiefly from the river Tama through an aqueduct. There are two systems of pipes supplying the districts which you see coloured on this map, [exhibited by the lecturer.] One, the Tama system proper, is supplied by an aqueduct entering the city at Yotsuya, and extends over the southern side of the city. The water of the Kanda water-works enters by the valley of the Kanda-gawa and supplies the northern side. This water comes partly from ponds; but, as the amount of water yielded by them is insufficient to supply the Kanda system of pipes, they draw the chief part of their supply also from the river Tama. The water is distributed by means of nearly seven thousand distributing wells, or large wooden vessels sunk in the earth and connected to the mains by short bamboo pipes. These pipes are always open, and enter the wells below the usual surface of the water. Some of the distributing wells are supplied so liberally as to be in a continual state of overflow, but in by far the great number the water is stagnant. The surplus water in the pipes is allowed to run out at various places into the canals, river or moats. These waterworks of Tokio were executed about two hundred and thirty years ago, and they certainly are a remarkable monument of the ability of the engineers of those times. We may acknowledge this freely, although we believe that the time has now come when these works should give place to something better. The supply of water which they give is sufficiently liberal. The river Tama alone yields, or at least might yield, enough not only for the districts over which the pipes extend, but for the whole city, including those parts which just now depend upon natural wells. Moreover, chemical analysis has shown that, when the water enters Tokio, it is pure and wholesome. I say, when the water enters; for, as we shall presently see, it loses its purity as it goes through the system of pipes, and by the time it reaches the outlets where overflow takes place it is very impure.

By a process of analysis chemists can detect whether water has been exposed to contamination by sewage. They cannot find out whether there are present in it any of those germs of infectious disease of which I have spoken, but they can tell us whether sewage has been allowed to mix with the water, and to what extent. And we may infer when the sewage contamination is considerable, that the water is at all times dangerous, and specially so when a disease such as cholera is present among the inhabitants, for it must then contain many of the particles or germs which form the specific propagating poison of that disease. Now, Professor Atkinson of this University has made analysis of specimens of the Tokio water taken from different points along the course both of the Tama and Kanda systems.<sup>6</sup> And he has found that, although the water is pure at the beginning, it becomes regularly and progressively less and less pure the farther it has gone through the city, until finally, at Odawaracho and at Riogoku, Bashi where there are outlets into the river, the impurity is astonishingly great. At Riogoku Bashi the amount of pollution by sewage is one part in twenty; that is to say if you were to take nineteen bucketfuls of pure water and mix then with one bucketful of sewage,—sewage of the quality of that which pours out of the drains of the city of London, you would get a mixture which is no more impure than the drinking water in the Tokio pipes at Riogoku Bashi. And this mixture, filthy as it is, is carried over to Honjô for the use of the citizens there, because even it is better than the water yielded by their natural wells. A Japanese friend of mine, who is fond of putting things in an epigrammatic way, says the people in Honjô cannot distinguish their privies from their wells, at least by the smell.

<sup>3</sup> Macaulay.

<sup>4</sup> Dr. Lyon Playfair.

<sup>5</sup> The statistics for twelve English towns will be found in the 9th report of the medical department of the Privy Council. They are also quoted by Mr. Latham, in his work on Sanitary Engineering.

<sup>6</sup> Transactions of the Asiatic Society of Japan, 1877.

Now let us consider what causes can be at work to account for this extraordinary pollution of the water which Mr. Atkinson has observed. There can be no doubt that it is caused by the entrance of surface water from the ground, which mixes with the originally pure water in the pipes. This surface water consists of rain and other water sinking down through the upper soil, and necessarily very full of impurities, especially in crowded districts. But the question remains;—how does this foul surface water find its way into the pipes? The pipes are as a rule originally well made and fairly well kept in order, and it does not appear likely that much water should get into them from the ground. It has been suggested that the mixture takes place by actual diffusion through the wood of the pipes. This I cannot consider sufficient to account for so large an entrance of impure water. There is one other possible explanation, which is, I think, the right one. It is this:—

The distributing wells are constantly kept in open communication with the pipes. Now, under the varying conditions of demand and supply it is quite certain that water from these wells must occasionally run back into the pipes and be carried on throughout the system, and afterwards enter other wells and be used. There is no doubt also that surface water and other impurities do get into many of the distributing wells. These are then partly carried back into the pipes, and by them are distributed over the system. This, I believe, is the chief reason for the gradual pollution of the water.

Impurities get into the distributing wells because they are not watertight, and because most of them are placed in positions which render them very liable to become polluted by neighbouring filth. Almost every well here, whether it be a natural well or one of these distributing wells, has a wooden gutter close to it into which the water, which has been used for washing rice, clothes and other articles, is thrown. Too often these gutters are provided with no suitable exit for their contents, and the dirty water which is thrown into them necessarily finds its way into the earth, whence part of it returns to the well. Besides this, the soil close to wells is often polluted by the most dangerous form of contamination—the leakage from a neighbouring closet. Moreover, some of the distributing wells are themselves natural wells also, and draw their supplies partly from the ground and partly from the pipes. Examples of this sort of well are to be found in this college. My students tell me that when they want a little exercise they sometimes stop up the supply pipe of one of these wells and then try to empty it. But they find that they cannot do so because the surface water runs in more quickly than they can take it out. Here, then, we have distinct and direct admixture of the pure Tama water with the surface water: and I submit that the same thing must happen, though to a less extent, in very many at least of the distributing wells.

I shall now try to show you, by means of a simple experiment, the way in which the impure water which has been standing in one of the distributing wells may, under certain circumstances, be sucked back into the pipes, and carry with it the impurities which it has collected, for distribution through the remainder of the system. Here are three inverted glass jars which may be taken to represent as many distributing wells ranged in a line. Each is connected by means of a short piece of tube to a larger tube, through which a stream of water is kept continuously flowing. Now, I shall pour some of this coloured liquid into one of the wells—the first of the series. This liquid may be taken to represent the impure surface water which is liable to leak into a defective well, or in fact any form of pollution to which the wells are liable. You will by-and-by see that the impure matter in the first well will spread to the other two and there render itself visible by discolouring the water. To make the effect easily visible to a large audience, I shall put into the other wells some of this second liquid, which is colourless in itself, but which produces a very strong colour when it comes in contact with even a small quantity of the first liquid, which has been put into the first well. Now, if we were to wait long enough, we should see the spreading of the original impurity by the slow process of diffusion, but we can easily cause the effect to take place much more quickly, by processes which are certain to occur in the real wells and real pipes of the city of Tokio. For instance, if I remove a few bucketfuls of water from one of these wells, water flows out of the first well, to assist the water in the pipes in refilling the well that has been partly emptied. Or again, by closing or opening the ends of the main pipe a little more or a little less, I can produce variations in the supply as well as in the demand, such variations as are sure actually to take place, and these also cause the impurity to pass from the first well into the pipe, and again from it into the other wells. The polluting matter may even travel backwards and infect wells nearer to the source of the supply. Now, imagine the effect if some of the excreta of a cholera patient find their way into one of the distributing wells. Not only will they affect those persons who use that particular well, but the water will act as a carrier of the disease, distributing the fatal germs, it may be, through a large district. It is a first principle in sanitary arrangements to make every household as independent as possible of other households, separating each from its neighbours

so that if disease occurs in one it may be confined to that one. You see how thoroughly this principle is violated in the system of water supply I am now criticising. By the courtesy of the officers of the Tokio Fu, I have been able to examine into this system more fully than would otherwise have been possible, and I find (what I could not have believed unless I had learnt it from a most trustworthy and authoritative source) that if anyone wishes to connect his well to the main pipes it may be done, no matter how bad the well may be. Even if sewage is obviously leaking into it, the connection will be made, provided the owner of the well is ready to pay the annual sum charged for the use of a supply pipe. The gentleman who told me this said it was the owner's look-out whether the water in his well was good or bad: if he liked to drink bad water that was his business. I hope I have succeeded in showing you that this is a matter which does not concern the owner or users of the one well alone, but the whole community. Even if we grant that a man has a right to poison his own water, we may certainly take such measures as will prevent him from poisoning his neighbours.

It would take too much time to-night to go at all fully into the question of what are the best remedies for the existing evils of the Tokio water system. The distributing wells should be clear of all likely sources of pollution. The outside of the wood should be surrounded with cement or puddled clay, so as to prevent the entrance of surface water from the soil. No stagnant gutters or leaky privies near wells should be tolerated, and everything that can be should be done to check the practice of washing articles of clothing, &c., near the wells. Loose covers might be provided to keep out dust; for dust is known to contain the germs of some forms of organic life, and very likely contains those minute germs which propagate disease. All wells which draw their supply partly from the pipes and partly from the ground should have the pipes disconnected from them and closed. Moreover the back-flow from the wells to the pipes might be prevented by the use of a simple valve such as this [the lecturer here exhibited a model of a flap-valve] giving free admission of water into the well, but never allowing it to return to the pipe. By this, any accidental impurity would be confined to the well which it first entered. Of course the pipes should be kept in good order. This is especially necessary in the low parts of the city where they are frequently under water, and not always running full. The whole system requires continuous and stringent supervision and control, in every one of its details, by skilled officers who understand both the sanitary and the engineering aspects of the case. Without this, sanitary legislation, however judicious, and sanitary appliances, however well designed, will be of little avail.

But no remedy would be so good as to abolish the present wooden pipes and distributing wells altogether, and substitute for them a complete system of iron and lead pipes like those used for distributing water over western cities. If this were done the water of the Tama, with its original purity wholly unimpaired, could be conveyed not only to the districts now supplied by the wooden pipes, but to every part of Tokio. The water in the pipes would have pressure sufficient to throw it to the top of every house in the city or suburbs; and it would therefore be directly available for extinguishing fires, without needing to be forced up by fire engines. A liberal supply of water with a good pressure upon it would pay at least a great part of its cost in the protection it would afford against the spread of fire. Besides this we must consider the greatly increased convenience to the inhabitants of having service pipes entering their houses. Above all these is the great sanitary gain; you would then keep the water pure instead of allowing it to be a medium for spreading the seeds of disease through the community. Compared with this all the other advantages of such a reform are insignificant. The only disadvantage is the cost, which would be great, perhaps about two millions of dollars. But we must bear in mind, that sanitary reforms such as this are really a remunerative investment, bringing in a good return on the money laid out, not indeed in the common form of so much interest per cent, but in the form of increased capacity for labour which may be turned into wealth. In other countries the central Government has helped the local authorities to effect sanitary works, by issuing loans on easy terms, which are gradually paid off by means of the local taxation. Surely by such an arrangement as that sanitary reforms might be effected in Japan without throwing too heavy a burden on the people. You have at least the advantage of having a Minister of Finance who is much interested in sanitary matters. We hear less about the question of cost when money is wanted for other social purposes, for education, for police, for army and navy, and for other public works. But if "progressive Japan" is to continue to deserve the name, some readiness must be shown to incur the expenditure without which great sanitary reforms are impossible. Surely the rulers of Japan, generous in other matters, will not be niggardly in one thing, and that, too, the thing on which the health and even the life of the people depends.

Let us pass now for a little to consider the natural wells in the higher parts of the city, in the suburban districts, to which

the wooden pipes do not extend. These wells may, I believe, be taken as representatives of the water supply of most Japanese towns. Natural wells are of two classes; in the first class are what we may call surface wells, the supply being taken from the closely neighbouring ground. The rain and all other water falling on it filters into the well and carries with it any impure matter with which the soil near the well may be charged. The other class consists of deep wells or Artesian wells, which draw their water from reservoirs or seams at a considerable depth, and below a stratum of clay or other material which is very impervious to water. The water in them is therefore not drawn from the surface close to the well, but comes from a distance. It is purer than the water in the surface wells, because it usually comes from some place where the surface sources of pollution are absent, and also because the water has to travel a long way before it reaches the well, and during its passage it tends to become purified. There are very few wells in Tokio which strictly belong to the second class. By far the greater number are, at least partially, surface wells. Even those wells which depend for their supplies on the strata of water at a considerable depth are so constructed as to receive surface water also, and are therefore liable to the pollution to which simple surface wells are liable. Professor Atkinson\* has examined specimens of water taken from several of the natural wells of Tokio, and Dr. Gierst\* has done the same for a very large number of the wells of Yokohama. Both gentlemen agree in finding that the water from these natural wells is excessively bad, except when the wells are of the deep class, and are constructed so as not to admit any surface water. One of Mr. Atkinson's results was specially interesting. He found that the water in the wells of Surugadai was particularly bad: in fact it was the worst of any he had analysed, far worse even than that taken from the city pipes near Rikugoku Bashi. At first this seemed surprising, for the Surugadai wells were unusually deep, and were apparently not more liable to surface pollution than others. But presently he noticed that the level of the water in these wells was almost the same as the level of the water in the Kandagawa canal, which runs by the foot of the hill. Then the mystery was explained. The Surugadai wells draw their supplies from that canal, which is little better than a huge sewer. At Suido Bashi, just before the canal passes the foot of the hill, many of the buckets of excrement which are daily being taken out of the city, where they are not wanted, to the country, where they are wanted, have their contents transferred to boats; and you may stand any day on the bridge and watch the men empty each bucket into the boats, and then wash it in the canal, whose waters, fresh with this addition to their already accumulated filth, flow on to fill the wells of Surugadai. This is of course an exceptional case; but it is by no means exceptional—it is quite usual—for the wells to be seriously polluted by the entrance of dirty water from the surface. They are made, as you know, by sinking in the ground a series of wooden tubes, each one slightly tapered, and fitting into one another with telescope joints. The holes into which these are put when the well is dug, is a little larger than the tubes themselves, and hence a ring is left round the outside in which the filled-in earth is probably more or less loose and porous, and which therefore acts as a sort of sponge to collect the surface water, whence it easily passes through the joints of the wood into the well. In very many cases the wooden tubes do not extend nearly to the bottom, but go down only a few feet from the surface of the ground, below which there is nothing but a bare round hole in the stiff soil. Close to the curb of the well there is a wooden gutter, which receives the water spilt there, and which often terminates in a hole in the ground, only a few feet away. This hole also serves as a convenient receptacle for decaying vegetables and miscellaneous dirt. And, to make matters worse, the dirty water from the neighbouring houses is often conducted to this gutter, as if the inhabitants were afraid the well would run dry, unless they returned to it what it gave. So they establish a sort of complete cycle of operations by first taking the water out of the well, then converting it into slops, and then letting it run down into the well again. And in order that the water may miss no possible chance of being poisoned, the privy is generally close by, its contents soaking into the soil, and thus charging it with the most dangerous form of filth. Your own observation will tell you that this account is not an exaggeration. I could point out wells of whose horrors what I have said just now only gives a faint and inadequate conception. Take a walk through one of the worst districts of Tokio, the district of Shitaya for example, and penetrate down the alleys which run off the streets and lead to the back of the houses, and you will see the wells and the dwellings surrounded by all manner of puddles of putrid filth. The water in the wells stands almost at the level of the ground, and is so dirty,—so absolutely green with dirt,—that the people subject it to a rude process of filtering before it is fit to be used even for washing. For drinking water, they use those wells which are a little better in their construction and of greater depth than the

majority; but they, too, have surroundings which make the very thought of so using them horrible. Our new vicedirector, Mr. Hattori, tells me that in Osaka many of the wells are so bad that the people actually prefer to take water from the river which flows through the city.

The remedies are obvious enough, but I have not time to speak of them to-night at length. To remove all pollution from the neighbourhood of the well by providing surface drains to carry off the dirty water, and by improving the privies—to deepen the wells and to make them watertight for a good way down—these are the main points to be aimed at. It does seem to me that the number of wells in the suburbs of Tokio is unnecessarily large. A few good ones in well chosen positions, insulated from dwellings, would satisfy the wants of the community as well as, and be far safer than, the present multitude of badly constructed wells.

Above all, great efforts must be made in the direction of surface drainage. I have left but little time to speak of drainage; and indeed the question is too technical a one to make popular treatment easy. But it is not the less important, for it affects not only the purity of the water supply but the state of the air also, and in that way it tells most directly upon the health. Indeed of all the sanitary influences which will have to be considered when Japan begins to move in the direction of sanitary engineering reforms, I think none is nearly so important as the surface drainage. The task of removing the surface water from a city such as this is a most enormous and difficult task; but, at present, even the most obvious and easy parts of the work are left wholly undone. Dirty water is allowed to accumulate in places where its presence is highly dangerous, and not the least attempt is made to carry it even a little distance off, where it would be deprived of the greater part of its power of doing mischief. The problem of the surface drainage in Japan is simplified by the fact that here the excrement does not mix with the rest of the sewage, and therefore the most dangerous constituent and the one which is most difficult to render harmless is left out.

This leads me naturally to say a few words about the system now in use for the removal of excrement. In Japan, this part of the sewage is treated separately, being kept almost entirely apart from other forms of refuse. From a sanitary point of view this is a great advantage, though I suspect it owes its origin rather to agricultural necessities than to correct views on sanitary matters, for it is apparently necessary to the continued fertility of the soil that the excrement should be applied to it as manure. Indeed so much is this the case that, whereas in most foreign cities, people are only too glad to have the sewage removed from the houses, and have to pay (in the form of taxes) for getting it done, here in Japan one looks on his discharges as a source of income. The system now in use is, I think, by no means a bad one, if it be properly carried out; and any sweeping change such as the introduction of the foreign water-carriage method—even if it were practicable—would be a more than doubtful advantage. But there are many defects in the way in which your system is conducted. The receiving vessels should be emptied with regularity and greater frequency than they now are: this cannot well be done so long as it depends on a mere private arrangement between the householder and the farmer who buys the stuff. Even at the risk of increasing the cost of the process I would advocate that the whole affair be placed in official hands and properly organised. Recently the Board of Health has advised that earthenware pots be used instead of the common wooden ones. The latter allow the sewage to leak or diffuse to some extent into the ground, where it will contaminate the surface water, and hence may poison any neighbouring wells (and unfortunately the well is never far off). You must bear in mind that of all the impurities to which water is liable none is nearly so dangerous as this kind of sewage. If the earthenware pots are properly glazed their contents cannot pass through them into the ground. But it is essential that they should be properly glazed, and not be left in a porous state. The other day I went into a shop to get a pot for this very purpose, and, seeing a nicely glazed one, I was proceeding to buy it, when the owner objected, saying it was a coffin, and pointing to another pot, which was quite unglazed and therefore porous, he said it was of the proper sort for excrement. As I did not see on what principle the comfort of the dead required a glazed pot, while the health of the living was allowed to depend on a porous one, I bought the coffin; but it is evident enough that, if the practice of using porous pots for the deposit of excrement becomes general, the object of the Board of Health in advocating the use of earthenware instead of wood will be entirely defeated.

Ordinarily, you know, the pots are buried in the ground: but that I consider objectionable for more than one reason. If by the accidental dropping in of a stone, or by a sudden frost, or by any other cause, the pot breaks or cracks, the owner will almost certainly continue to use it, rather than go to the expense and trouble of getting a new one, and so the neighbouring ground will be polluted. And again, if the pot is sunk in the ground, its contents have to be taken out with a ladle, so that a residue is always of necessity left, which serves as a nucleus

\* *Loc. cit.*

8. Transactions of the Asiatic Society of Japan, 1879.

to hasten the putrefaction of the subsequent deposits. Now, I should place the pot above ground, and support it in a frame so that it could turn round on a horizontal axle and empty its contents into the farmers' pails completely, and much more conveniently and quickly than is now possible. Here is the before mentioned "ciffin" supported in the way I mean. [The lecturer explained this arrangement exhibiting a sketch and model of a large pot suspended so as to be free to turn on a horizontal axle, like the trunnions of a gun]. Of course you will see that this arrangement requires either that the floor of the closet be raised or that a pit be dug under it of sufficient size to hold the frame and give the pot room to turn, but this difficulty is not at all insuperable. The ground on which the frame stands should be coated with cement or other impervious material to allow for the accidental spilling which is likely to take place occasionally. I might say a great deal more about this rather unattractive subject, but the lateness of the hour obliges me to hurry on, for there is still something to be said before we part.

No doubt some of the existing evils would be avoided if the people generally had even the most elementary knowledge of what are good and what are bad conditions of living, but it is useless to expect that much can be done towards sanitary reform by the action of individual members of the community; or that they will voluntarily unite and act together. The only possible way is for the local authorities to take the matter up, and compel the necessary changes to be made. Compulsion of this kind is perfectly fair, and consistent with real freedom, for in sanitary matters what each man does affects not himself alone, but the whole community. Further sanitary reforms of an engineering kind cannot be effected except by the design and direction of men who have received a very special sort of technical training.

I consider that the first step towards an effective remedy would be the education of a large number of native Sanitary Engineers, who would be officially appointed to different districts throughout Japan, and who would be able to plan and superintend all sorts of sanitary works, as well as to inspect, and maintain in the best possible efficiency, the existing appliances. They would require to possess not only engineering knowledge, but special knowledge of sanitary conditions of living, and of the modes of applying the art of engineering so as to secure these conditions. Now, if a large body of sanitary engineers were distributed over the country, intelligent supervision would be possible; measures of sanitary reform might gradually be carried out under the order of the local authorities; and the legislation of the Central Board of Health could be put in force far more efficiently than would otherwise be possible. These men would be essentially engineers, not medical officers of health, whose training and whose functions are wholly different. The district sanitary engineers would be able to introduce improved modern methods when the time came for these to be introduced, and in the mean time would apply their scientific knowledge so as to make the best of existing materials. The training of Sanitary Engineers should be of a high order, quite as high as that of any other class of engineers; and it must be to some extent special training, different from that which other engineers require. I have suggested to the authorities of this University the desirability of making Sanitary Engineering one of the special courses of instruction here. The professors of Civil Engineering, Technical Chemistry, and Geology have taken up the matter variously, and have offered to take part in the teaching of this subject; and one of the professors of the Medical section of the University has been so good as to offer to supplement the course by a short series of lectures on hygiene. We have drafted what is, I believe, a fairly complete course of instruction in sanitary engineering, and have submitted this draft to the Directors of the college. I hope soon to hear that they have accepted the suggestion. If so, the course will be established, and when it is established I trust that many of the young men of Japan will come forward to enter on the career thus opened to them. In foreign countries the profession of Sanitary Engineering holds a high rank, as high as that of any other department of engineering. In Japan the subject is an entirely new one, but is certain soon to become of the very first importance. The pioneers in it will have a splendid opportunity of doing good work for their country, and securing an honourable future for themselves.

The subject which we have been considering this evening has been forced on the attention of the public of Japan by successive epidemics of cholera, in a way that compels attention. You all feel, and your rulers, I am sure, also feel that something must be done. The lesson which the recurring epidemics teach us cannot be wholly lost. But so far nothing effectual has been done. Once after another epidemic comes, and finds the same conditions still present which are favourable to its spread. I admired, or everyone must have admired, the zeal with which you fought last year the battle with cholera, when once it was in your midst. But it is not by even the most active and best intentioned measures, when cholera is present, that the battle is to be successfully fought. It is by taking advantage of the intervals between the successive invasions of the disease to remove those conditions which make cholera possible. These

intervals are the proper times for action. Use them well, and the day of great epidemics will be past. And not only that, but other diseases will lose much of their hold on the people, and the general standard of health will be raised. If, on the other hand, you neglect the lessons which are so practically and forcibly taught you,—if you choose to go on disobeying the plainest laws of health,—nothing can be more certain than that you will suffer the penalty of your disobedience.

## PARIS LETTER.

PARIS, March 27th, 1880.

The Jesuit question has been bequeathed to the Republic, like so many other difficult matters, by the preceding Empire, and, in a measure also, the Kingdoms. It is rather hard to blame the Republic then for putting the law in force in obedience to the grand majority of a freely elected Chamber of Deputies, who represent the nation. But it is not the less hard for the extreme republicans to demand that ministers should expel the illegally constituted religious orders in twenty-four hours, or that they are to be accused of weakness, for communicating with the Pope as to the manner the foreign members of the Order of Jesuits ought to quit France. His Holiness has not been consulted about the application of the law: that has been decided independently of his advice; he is only invited to direct the Jesuits to retire quietly without necessitating a recurrence to violent measures. No compromise has been proposed, and in the revision of the licenses of the religious establishments existing by permission, or in according the liberty of residence to such as do not possess it, the ministry will act on its own responsibility. Henceforth, no permission will be accorded to any order to establish itself in France, without a vote of the Chambers declaring the proposed institution as of public utility.

Deputy Brisson's motion to bring all convents and monasteries within the pale of taxation, whether national or local, is a very serious blow to these institutions, and as the republicans will occupy themselves with the secular side of these questions, they insist that, as there shall be no privileges for themselves, so there shall be none for their opponents, for unhappily the clerical party, in siding with the monarchial conditions, has to take the consequences of defeat. For the good of all combatants, it is best to fight out a battle that was inevitable.

The Bonapartists are certainly to be praised for the industry they display in working against fate: their burning and shining lights, those too deeply dyed in imperialism to be incapable of taking any other color by a change, organized a reunion at Belleville. The hall was filled, not with the electors of Gambetta, but with the imported mamelukes of the defunct régime. There was no dancing to the piping. Prince Napoleon's name fell on deaf ears. One speaker accused the Republic of crushing the Commune, which is a true and legal bill, and an exercise of power under terrible difficulties that the partisans of all pretenders would do well to ponder over, especially since that form of government is now enormously strong and united. An old man in the crowd exclaimed, "the Empire was no better." Transported to the platform, he demanded an explanation of the shooting at the time of the Coup d'Etat, and that greater criminal slaughtering, the declaring of unjustifiable war against Germany. He paused for a reply, and it is said is pausing still.

Holy week is proverbially sombre, and it has not lost this character so far; the pilgrimages to the churches to listen to the melancholy and wailing music of the *Stabat*; the altars divested of their ornaments, the chapels with figures of Christ in the tomb, the dark draperies, the dim lights, the complimentary religious mourning of women and children, contribute to sadness; not a bell will ring till after sunrise on Easter Sunday, when piety can rejoice to its full. Connected with the closing of theatres and *cafés concerts* on Good Friday, I have never heard or read of any protest on the part of the most rabid materialist. Ah! it is difficult to entirely shake off past reverence or early beliefs.

The fair people admit they have done an excellent business during their three days work. Sausages, relatively speaking, were more in demand than hams. Alsatian products of the former class were patronized by ordinary housekeepers: the sellers were these fine buxom Alsatian girls, with dark auburn hair, dark blue eyes, freckled features, broad shoulders, and the large bow of black ribbons with ends of Atlantic cable proportions; they looked patriotism, and those in whose souls that feeling was dead, were caught by a winning smile, and an invitation to taste the wares, with a sip of wine and a morsel of bread for nothing. Pork butchers are one of the grand institutions of Paris. Zola wrote up their merits before he wrote down the select society world of the *Assommoir* and *Nana*. Every part of the animal dear to St. Anthony is turned to account in their establishments, which are elegantly fitted up. They have cauldrons that each day at noon, turn out scraps in the way of ears, tongues, tails, trotters, and such odds and ends, into which the workman dives with a fork for his morsel at four sou's, or the pale and laughing needle girls, with their roll of bread, bundle of radishes, and scalene triangle

of cheese. At the outset the pork butcher was persecuted like a Jew; he had to wheel his pork in a barrow through the streets, and if his teeth were not drawn for financial reasons, he ran the risk, during *Carême*, of being banged, broken on the wheel and quartered, if he was the cause of any person eating his merchandise during the fixed black days of Lent. It was no joking matter in the fifteenth and sixteenth centuries to hunger after the flesh pots of Egypt. Passaigal for eating bacon and beans in Lent, had to do public penance before the entrance to Notre Dame. Guillon was beheaded in 1629, not for appropriating a portion of a tempting horse lying dead in a meadow, but for cooking or rather for eating it, although he alleged he was dying of hunger. Madame de Maintenon had a girl aged twelve whipped three times on the bare back with rods, for dipping her fingers into a meat jelly on a fast-day and then sucking them. A certain well known princess under the second Empire, but who has since gone wrong, dismissed her butler for giving a plate of meat to her pet pugs on a Good Friday.

Père Hyacinthe Loyson has had full churches during his special, week-day, Lenten sermons. He says he is making converts, which is likely, as he is running into debt: he wanted over fr. 8,000 to wipe off the liabilities of his church; he placed in an envelope, on the chair of each person present, a card and pencil—a hint from the race courses, and suggested good souls would write thereon what contribution the collector might call upon them for: the cards were gathered after the service, and enabled the debt to be written off. It was also understood here that M. Loyson was under the special care of the goody people of England—the "Old Guard" in a word.

The Municipal Corporation must be a terror for all depending on them. A M. Lacroix expressed his indignation that in the school-books of the city public schools, he found in one "Sacred History" such "nonsense as the Israelites crossing the Red Sea, and the Falling Down of the Walls of Jericho." Another volume "accused the protestants of the massacre of St. Bartholomew, and justified the revocation of the Edict of Nantes;" a third "glorified the Coup d'Etat of 1851;" and a fourth described the heroes who took the Bastille as a "set of ruffians." The corporation voted the immediate suppression of these volumes as so much poison for youth: and in addition called upon their authors who hold professorships in the municipal colleges to resign. Then it examined a new plan for feeding foundling babies.

The Universal Peace Society has held its annual meeting: if the audience smiled at the common places, and appeared cynical in respect to the peaceful influences of bloated armaments, it relished the excellent music and private theatricals—two capital means to make Quakers' meetings interesting. The Antislavery Society also took advantage of Lent, when spirits are weak and impressionable from low diet. It circulated a roll of Nicotine terrors, 37 inches by 10; among the most fearful consequences of indulging in a quiet pipe or the naked beauties of a cigar, are; it makes deaf people, deaf, and some people mad; it ruins the teeth, produces "bacteria" in the blood, which like Satan constantly riggle about, seeking what they can devour; and promotes the depopulation of a country, a hint that curates ought to read mark, learn, and inwardly digest.

*Attila* has been very successfully brought out at the Grand Opera, and it is not a triumph so much for French artistes, as for art itself. The libretto is in French: Manuel has been pronounced perfect and would be declared incomparable, only Mlle. Krauss's *Attila* was equal to his *Rhadamès*. The other stars differed in glory. It would pay T. Cook and Son, to organise a special excursion, as has been suggested, to only see the splendors of the Opera. What sumptuousness and luxury the "ancient Pharaohs" enjoyed! What a happy day it was for Joseph, when he was sold by his brethren.

The Odéon theatre has brought out a most successful four act tragedy—*Les Normans d'Attila*—in verse, by Henri de Bornier. It is the dramatic and literary event of the season, for in both senses it is faultless: it places Dumas and Sardou in the shade; and the poetry and plot are as good as anything Hugo ever produced. The author is over fifty years of age, and is a grandfather; he has worked all his life at poetry and the drama, yet he only produced his first piece *La Fille de Roland*, a great success, in 1875, and the present may be regarded as his second. The plot is admirable: it is a struggle between barbarism, innocence, force and weakness, a tiger and a gazelle. Attila has conquered the Gauls; among the prisoners brought to his camp on the banks of the Danube, is Herriek, King of Burgundy, and Hildiga his daughter: Attila's two sons fall in love with her: but he puts Herriek in irons, and so leaves Ellak free. The fact is he loves her himself, and is determined to marry her, which she resolves to agree to, in order to save the life of her father and his fellow prisoners. Valtor, ambassador from Burgundy, offers gold for the release of Herriek: the gold and the messenger are retained—also the King. Conspiring for the latter's flight with Ellak, Valtor is seized, and ordered to be decapitated by Herriek, Attila's own son. The nuptial night arrives; Hildiga assumes resignation, but a fellow-countrywoman, divining her feelings, presents her with an axe, concealed in her clothes, with which to slay Attila.

The weapon is hidden in the bed: Ellak arrives, invites Hildiga to fly, but perceiving the axe guesses its purpose: "it is to kill your father," she replies: "if you apprise him, he will slay me: choose;" at this moment Attila enters: Ellak tries to put him on his guard, but the father beckons him away. Left alone, Hildiga watches her moment, and strikes down Attila; he survives the blow, but not wishing it to be known that he has been felled by a woman, he circulates the story that he did it himself. At this juncture the victorious Franks arrive, fire the camp, and liberate the prisoners. The acting is magnificent; each verse was applauded by the most cultivated of audiences. Mlle. Rousseil (*Hildiga*) and M. Dumaine (*Attila*) were brilliant in their parts: the scenery is exquisite, and the costumes historically accurate. In one scene, the glass roof of a palace disappears to make way for the conflagration.

Royal scions are strange folks:—the Duke of Bavaria, who is a doctor, operated successfully, on a Frenchman at Montevideo for cataract. Prince Oscar of Sweden, declining all aid from publishers, passes his time in Paris at the second-hand bookstalls; he returns to his hotel with a cab full of volumes, mentally ejaculating like Dominie Sampson, "prodigious!"

President Grévy and his lady intend to make the peoples' park at Vincennes fashionable, but not a rival to that of Boulogne: they take their walks abroad there occasionally.

Current statistics:—Three aristocratic couples have this week lodged demands for legal separation; there were 106 candidates competing for 52 vacancies of copying clerks, and among them were 16 barristers and several university graduates desirous of being passing rich on sixty pounds a year.

Another misfortune for Macmahon: it is alleged he is not of Irish, but of German descent, since his ancestors figure among the births, marriages, and deaths, on the parish registers of the seventeenth century, at Strasbourg.

There are now five editors in the journalists' prison in Paris; they have one advantage; they will not want for either bed or board for six months to come.

In a piece now being acted, *La Roche aux Mouettes*, there is a scene where newspapers are introduced and discussed; this affords scope for denouncing and ridiculing the reactionary newspapers—a new kind of warfare.

#### JAPANESE NEWS.

[The following Notes on various Japanese matters are chiefly derived from the native papers, occasionally supplemented from original sources of information, and are carefully collated and edited, so as make them readable and intelligible.]

#### COURT, POLITICAL AND OFFICIAL.

His Excellency Matsukata, Minister for the Interior, will leave Tokio about the 7th of next month, in advance of His Majesty the Emperor on the approaching Imperial progress.

Mr. Matsuda, the Governor of Tokio, now occupies an official residence at Uneme-cho, Tsuchi, belonging to the Tokio Fuchō.

Judge Torii, President of the Hiroshima Saibansho, and Judge Ban, President of the Matsuyama Saibansho, have arrived in Tokio on some official business.

The local assembly of the prefecture of Ishikawa was opened on Monday last.

We learn that the Aikokuha (Patriotic Society) has applied to the Government for permission to continue its organization under the recently issued regulations affecting political societies. It is said the required authority will be granted.

His Excellency General Ida, Envoy Extraordinary and Minister Plenipotentiary to the Court of Vienna, who is shortly leaving for Europe, has given a farewell banquet to the high functionaries of the different Departments, military officers, and several prominent private gentlemen in the Pariokwan.

The *Nichi Nichi Shinbun* says that "the memorials addressed to the Government from different parts of the country now number more than forty. The document from the Aikokuha, forwarded to the Government by Mr. Kataoka Koukichi and its other representatives, is different from the others. It was addressed direct to His Majesty the Emperor, and demanded the establishment of a National Assembly.

The Insetu Kioto (Government Printing Office) is to be further enlarged. Additional buildings, covering 1,050 tsubo of land, and costing 50,000 yen, are to be erected.

The local assembly was opened in Kioto on the 7th instant. Mr. Tachibana, the new Governor of Osaka, left for his post on the 12th instant.

The construction of the head office of the Colonial Department, at Sapporo, has been commenced.

The *Mainichi Shinbun* gives it as a current report that His

Excellency Okuma, a member of the Privy Council, is likely to resign his office, or that he is to be raised to the rank of Kwazoku.

The same paper also states that it was rumoured, some few days ago, that a very warm discussion had taken place among two or three members of the Privy Council in the Cabinet, but the subject of discussion was not ascertained.

It is said that His Excellency Shinagawa, Vice Assistant Minister of the Home Department, is to be appointed Assistant Minister for Finance; and that Mr. Narabara, Vice Secretary for Home Affairs, is to be made the Chief Superintendent of the Agricultural Bureau.

A new Post Office is to be built in Otemachi, Tokio, covering upwards of 900 *taubo* of land.

The *Akebono Shimibun* is responsible for the following:—"According to what we have recently heard, notwithstanding the issue of the regulations respecting political meetings, open air lectures are delivered in Okayama in increasing numbers. While the lecturers are holding forth, they often draw their glittering swords, and exclaim to the audience, 'this is what is called the prop of the popular rights.' From this it appears that they make use of rude and intemperate expressions, and attack the acts of the local officers."

A local assembly is to be established in Kagoshima this year, for the first time.

The question whether the cost of a scheme for the general assurance of buildings against fire should be added to the local taxes, was laid before the Senate for consideration on the 10th instant.

The establishment of a Marine Court is now under the consideration of the authorities.

His Excellency Yanagiwara, Envoy Extraordinary and Minister Plenipotentiary to the Court of St. Petersburg, is to be presented in audience with His Majesty the Emperor, in a few days.

The cavalry escort which will accompany His Majesty the Emperor on his visit to the provinces, will return from Kobe to Tokio overland, along the Tokaido. His Majesty will return by sea.

It is said that it has been officially announced that His Majesty's tour will include the prefecture of Hiogo.

The Tokio Library, which is now in charge of the Tokio Fu authorities, will in future be under the supervision of the Education Department.

His Excellency Yoshida, Envoy Extraordinary and Minister Plenipotentiary to the Government of Washington, accompanied by his staff, arrived safely at the Japanese Legation in that city on the 4th instant.

Mr. Takatsuji, an Imperial Chamberlain, left Tokio on the 11th instant, on a tour of inspection through the three prefectures of Fukushima, Iwate, and Miyagi.

The draft of the criminal code having been passed in the Senate, it has been forwarded to His Majesty the Emperor for approval.

The *Nichi Nichi Shimibun* states that His Excellency Okuma, Privy Councillor, is to be made adviser to the Cabinet, (the office formerly occupied by His Excellency the late Kido). The same journal contradicts the statements made in other papers about His Excellency's resignation, and asserts that he is daily in attendance at the Daijo Kwan.

Mr. Takesoye, under Secretary of Finance, who some time since went to China on official business, returned here on the 10th instant, in the *Tokio Maru*.

His Excellency Okuma has addressed a memorial to the Prime Minister respecting the future steps to be taken about the finances of Japan.

Mr. Tanaka, Vice Secretary for Home Affairs, left Tokio on the 12th instant, on an official tour of inspection through Aichi and other prefectures.

Mr. Gimbayashi, Sakan of the first class, has been appointed Under Secretary of Tokio Fu, and Mr. Endo, Under Secretary of Osaka Fu. Mr. Okamoto, Secretary of Hiogo Ken, has been relieved from duty at his own request.

The Minister of the Interior has applied to the Prime Minister for an increase of the salaries of *Hanjin* officers, (officers from the 8th to the 17th class).

Frequent mention has been made that Mr. Kataoka and others representing the members of the Aikokuha have addressed a memorial to the throne, demanding the establishment of a National Assembly. We are now informed that Kataoka and Kono were summoned to the Cabinet Hall, on the 11th instant, when they were told that such a memorial could not be received by the Prime Minister, and the document was returned to them.

His Excellency Inouye, Minister for Foreign Affairs, is said to have been entrusted with the negotiation of a convention with the United States Minister, in regard to the payment of expenses incurred in rendering assistance to shipwrecked mariners.

Mr. Shima, Governor of Iwate, and Mr. Hitomi, Governor of Ibaraki, arrived in Tokio on the 12th instant.

Mr. Matsuda, Governor of Tokio, assembled the chief officers of the different districts on the 11th instant, and held a conference with them about the rise in the price of rice.

His Imperial Highness the infant Prince Hari-no-Miya, is to be presented in audience with Their Majesties the Emperor and the Empress, at 10 a.m. on the 15th instant.

The management of all affairs connected with the National Industrial Exhibition, was handed over by the Ministers of the Home and Finance Departments to the Chief Commissioner, His Imperial Highness Kita-Shirakawa, on the 8th instant.

The Post Office Buildings in Hakodate, having been destroyed by the great fire last year, are now to be rebuilt at an estimated cost of 15,000 yen.

Mr. Yamataka, Under Secretary of Finance, has been ordered to Kyoto and Nara.

His Excellency Yoshii, Vice Assistant Minister for Public Works, who is now returning to Tokio from Kinabiu overland, will inspect the Miike mines during the journey.

Diplomas are to be distributed among the students who have passed their examination, at the Imperial College of Engineering to-day. About forty students have been successful.

#### NAVAL AND MILITARY.

Two swords, manufactured in the work shops belonging to the Sendai garrison, have been lately forwarded to the office of the Imperial Guard to be tested.

The regular forces belonging to the infantry, artillery, commissariat, and coast artillery in the six garrisons, number 31,400 men.

Ceremonial services were held on the 14th instant on the completion of the monument at the Yasakunishinsha (formerly Shokonsha) at Kudan, Tokio, in memory of the Imperial Guards who were slain during the last south-western rebellion. There were also horse-races, wrestling, and a display of fireworks on the occasion, the total cost being estimated at 800 yen.

Fourteen military cadets from the Kiododan were appointed to the army on the 7th instant.

His Majesty the Emperor visited the Staff Office on the 8th instant.

A review was held on the 7th instant, at the Hibiya parade ground, in honour of the members of the French Military Mission, who are leaving for Europe. They were entertained at the Enriokwan, on the 10th instant, at a farewell banquet.

Telegraphic information has been received to the effect that the *Higei Kan* has arrived safely at Singapore.

It was notified by the Minister of War, on the 5th instant, that if the men belonging to the army or military cadets violate the Meeting Regulations, they are to be punished by the local civil courts.

One hundred and thirty-five cadets have lately passed the examination at the Kiododan. Forty-five of the most successful have been permitted to enter the Military College, and the others were appointed to different garrisons.

Sub-lieutenants and midshipmen now serving on board the various men-of-war, are shortly to be transferred to different vessels.

The *Kongo Kan* will sail for Corea, within a day or two.

The manufacture of torpedoes is going on very successfully in Yokosuka. The local production is said to be better than the imported article.

The cadets belonging to the military college proceeded to the

prefecture of Kanagawa, on the 9th instant, for the purpose of practising field surveying.

The *Riujo Kan* is to sail for Nagasaki at the end of next month. The vessel will take a number of naval cadets on the cruise.

The *Raiden Kan* will in future be employed cruising in the Japanese seas for the purpose of training engineer cadets in the practical part of their duties. Each trip will last about a month.

The *Setsun Kan* has been turned into a training ship, and stationed close to the buildings occupied by the Navy Department.

#### INDUSTRIES, TRADE, AND FINANCE.

In order to encourage mining industry, the appropriation for the Mining Department is to be increased.

Frequent mention has been made of different nobles having directed their attention to Yesso, with a view of furnishing employment for their former retainers. A native paper now gives further particulars on the subject and says, that the ex-daimio of Owari (Tokugawa Yoshikatsu) has purchased 1,500,000 *tsubo* of land in the district of Urakufui in the province of Iwuri. Nabeshima Nawohiro, ex-daimio of Hizen Mori Motonori, ex-daimio of Choshu, Kwazoku Yanagiwara, Minister to St. Petersburg, Kikutei, Musha-no-koji, Morino-koji and others, have also applied to the authorities for permission to purchase a large tract of land in Yesso. His Imperial Highness Prince Higashi Fushimi, is stated to be about to make a similar application. The same journal also mentions that the *Knishinsha* (Progressive Society) established by Mr. Iwahashi, the President of the 44th National Bank, has secured the confidence of both the Government and the people. A portion of the shares, representing 2,000,000 yen, is to be subscribed for by nobles. The *samurai* belonging to the former Nagaoka clan have subscribed the sum of 1,000,000 yen towards providing employment for some of their poorer brethren, and intend to devote a portion of the fund to the establishment of a private bank in Yesso.

The *Osaka Nippo* states that some Nagasaki merchants are going to buy 1 *rin* copper money at a premium of 20 yen per 100 yen, for the purpose of selling to Chinamen at a premium of 35 or 36 per 100 yen.

Speculation in money has been permitted in the Osaka Stock Exchange Office since the 10th instant.

One hundred and forty-seven *shizoku* of Shimane Ken have applied to the authorities for a loan of 120,000 yen, on the security of their pension bonds, for the purpose of cultivating the waste land in that prefecture.

The *samurai* belonging to the former clans of Sendai, Aizu, Morioka, Hirosaki, Kubota, and Shonai in the north (who were deputed to defend the island of Yesso during the reign of the old Bakufu Government), are now going to form a farming company at Sapporo.

A Chamber of Commerce has been opened at Fukui, in the province of Echizen.

The Finance Department sold a large quantity of rice from the godowns at Asakusa to the retail dealers in the capital on the 12th instant. The purchasers numbered 2,438.

The *Choya Shimban* says:—"It is rumoured that, in consequence of the present great pressure of financial difficulty, the expenditures of the different Departments of the Government are to be greatly decreased. We are, however, unable to vouch for the truth of the report."

One of the native papers mentions that the Osaka Mint has imported a large quantity of silver from China, at a cost of 1,040,000 yen. The same authority states that this silver will, when coined, turn out about 5,000,000 (?) yen. Another paper informs its readers that the Mint is at present so fully employed that work commences daily at 4 a.m. and is continued until 9 p.m. The journal also states that 400,000 ounces of silver have been purchased from an Englishman, and that it is proposed to buy 3,500,000 ounces more.

Five thousand *koku* of rice have been imported from the province of Yetchiu, on account of the First National Bank of Tokio.

The building for the Museum attached to the Colonization Department at Hakodate having now been completed, various

agricultural implements are to be sent thither from Tokio for exhibition.

The following return, taken from a native paper, shews the total of number of national banks in Japan and their respective capital. The return is made up to the end of last year:—

Number of Banks.	Aggregate Capital.
31 .....	50,000 yen.
2 .....	60,000 "
10 .....	70,000 "
12 .....	80,000 "
2 .....	90,000 "
25 .....	100,000 "
3 .....	120,000 "
1 .....	130,000 "
2 .....	140,000 "
7 .....	150,000 "
1 .....	180,000 "
14 .....	200,000 "
4 .....	210,000 "
1 .....	220,000 "
1 .....	203,700 "
1 .....	240,000 "
8 .....	250,000 "
8 .....	300,000 "
1 .....	350,000 "
1 .....	450,000 "
1 .....	600,000 "
1 .....	700,000 "
1 .....	1,500,000 "
1 .....	17,820,000 "
140 .....	38,089,700 yen.

#### MISCELLANEOUS.

It is reported that several incendiary fires have recently taken place in the capital, and that the local police are endeavouring to discover the perpetrators of such heinous crimes.

The *Mainichi Shimban* states that the editor of the *Nisshin Shimban* has been fined 100 yen, for publishing one of the numerous petitions presented to the Government, on the subject of a national assembly.

We notice in the *Nichi Nichi Shimban* a statement that fatal cases of cholera have occurred in Tokio, Kanagawa Ken, and Hiogo.

It is rumoured that the authorities are about to establish a penal settlement in Yesso, with the object of bringing land under cultivation. Good conduct will lead to considerable amelioration in the condition of the prisoners, who will ultimately receive wages and a certain amount of freedom. Religious instruction will also be provided for them, and every inducement held out to them to reform and become useful members of society on their complete restoration to liberty.

A lecture was delivered at the Iku-mura-ro at Suga-cho, Asakusa, Tokio, on Sunday last. This was the second lecture delivered in that building since the issue of the new regulations, and the attendance was much greater than was anticipated. More than three hundred persons were present.

A branch of the Chinese school, established in Tokio by the Ko-a-kwai (Society for the restoration of the influence of Asia) is to be established in Kobe.

Kwazoku Kido Shojiro, son of the late Kido Takatoki, formerly adviser to the Cabinet, left on the 12th instant for Germany, for the purpose of study.

A new periodical, styled the *Homei Shinshi*, will in future appear every Saturday. The publishing office is at Ginza, Nichome, Tokio.

A native paper states that the sum already expended by Archimandrite Nicolai, of the Russian mission, for introducing the Russian religion into Japan, has amounted to 23,000 yen, and that the Russian Government recently remitted him a large amount of money in furtherance of the same object.

A man dressed like a tradesman was killed by a railway train running over him at Goto-yama-dori, near Shinagawa, shortly after 10 p.m. on the 11th instant.

A telegram from Kumamoto announces that there was a very severe case of Asiatic cholera at Namitachi Mura, Awatagori, in that prefecture, on the 7th instant.

Mr. Uchida, editor of the *Choya Shimban*, was fined 10 yen by the Tokio Saibansho, on the 13th instant, for a breach of the libel laws.

A native journal gives the following as the number and length of the rivers in Japan:—

Number.	Length.
4.....	over 1 ri.
8.....	" 2 "
19.....	" 3 "
18.....	" 4 "
26.....	" 5 "
18.....	" 6 "
28.....	" 7 "
25.....	" 8 "
14.....	" 9 "
206.....	" 10 "

## JAPANESE PERSONAGES.

## VIII.

## GENERAL MIURA GORO.

GENERAL MIURA is a member of the Choshin clan, his family name being Ando, which was changed, in accordance with Japanese custom, on his being adopted by his father-in-law, Miura, whose property he has inherited. The subject of this sketch was distinguished during his boyhood and youth for his fearless disposition and the extreme devotion which he paid to his studies, more especially those dealing with military subjects.

When the Bakufu Government despatched an expedition against the Prince of Choshin, Miura joined the late Mr. Takugi, General Yamagata, and other influential leaders, in exhorting the members of the sept to show a firm front and oppose the threatened danger. Their exertions were crowned with success, and the men of Choshin, fired with patriotic enthusiasm, determined to repel the invaders of their hearths and homes or die resisting gallantly to the last.

The result of the expedition is history. Miura, at the head of a detachment operating on the Kokura road, contributed in no small measure to the frustration of the efforts of the assailants, who, beaten in several severe engagements, withdrew their shattered forces, to a place of safety. Owing to the altered condition of political affairs, the invasion of Choshin was abandoned, the Bakufu authorities being engaged in a struggle for existence in the north against the constantly increasing power of the Imperial party.

Miura took a prominent part in the wars of the restoration, and commanded the imperial forces entrusted with the task of reducing the province of Echigo to submission. The fruits of early training, matured in the stern school of later years, were now made fully apparent. Miura gained a series of brilliant victories over the rebel army opposed to him, inflicting defeat so crushing that, when the campaign closed, the royal authority was firmly established and the malcontents dispersed.

When peace was reestablished, Miura was appointed a Lieutenant-General in the army, and has since received the insignia of the Japanese Order of the fourth class.

In 1876, the standard of revolt was raised by Maibara Issei; and Miura, then in command of the garrison at Osaka, took the field at the head of troops hurriedly got together for the purpose of quelling the rising before it had time to attain formidable proportions. Miura executed a forced march to Higi, and encountered the rebels in several engagements; the result being, that the armed opposition to the Government was first localized, and then stamped out.

Scarcely had this service been successfully accomplished, than the Satsuma rebellion broke out, taxing all the resources of the Government and the utmost skill and energy of the Imperial leaders. Miura, at the head of one *corps d'armée* took a prominent part in all the momentous struggles of that eventful period. In Higo, Osumi, and wherever hard blows were struck and danger to be encountered, Miura was to be found in the forefront of the battle, leading his men with the most desperate bravery and a contempt of death which compelled the admiration of the foe and excited the emulation of his followers. At last the sanguinary struggle was closed with the crowning episode of Shiroyama, and the forces were enabled to rest after their arduous toils and painful sacrifices. Miura was not overlooked when the distribution of rewards for faithful services and dauntless courage took place. Promotion to the rank of General, and the Order of the Rising Sun of the second class, were allotted to the warrior who, in the full enjoyment of mental and bodily vigour, is now, as ever, ready to furnish with his victorious sword the material for another chapter in the history of his country, should the circumstances of the nation again demand his services.

## TELEGRAMS.

London, April 16th.—Sir Stafford Northcote and Lord John Manners are to be created Knights of the Grand Cross of the Bath.

Obituary—Lieutenant-General Armstrong, Inspector-General of Auxiliary Forces.

The *Daily Telegraph* publishes a paragraph stating that Prince Leopold is to be created Duke of Albany.

Constantinople, April 17th.—The Grand Vizier of Turkey has advised summoning the Turkish Parliament under a modified electoral law.

Allahabad, April 17th.—The Viceroy's resignation will be absolute, and will be tendered simultaneously with Lord Beaconsfield's.

He is prepared to remain here until the arrival of his successor, probably in the autumn.

Paris, April 19th.—M. de Freycinet has issued a circular despatch, in which he states that France is undesirable of changing the policy of M. Thiers, whilst, however, endeavouring to hasten the strict execution of treaties, and the peaceful solution of pending questions.

London, April 20th.—Mr. Cross, the Secretary in the Home Department, is to receive the Grand Cross of the Bath.

Bombay, April 20th.—A strongly personal and courtly letter from Lady Burdett-Coutts, refusing a subscription to the cost of Mr. Gladstone's son's election, did the Liberals good, as tending, people thought, to show that strong under-currents of courtly feeling existed against Mr. Gladstone, and this, after the Queen's book, has had an unpleasant effect. Nobody, who has thought much on the subject, now doubts that the book was published at this time to injure Mr. Gladstone, by making it appear that he has not the favour of his Sovereign.

Jellalabad, April 13th.—The villages, whose inhabitants are implicated in the murder of Lieutenant Thurlow, have been burnt by Captain Tucker, the Political Officer.

Cabul, April 14th.—The Durbar has created a favourable impression amongst the more influential people in Cabul, and has completely broken up the combination of the Ghuzni Chiefs against us.

The Maustafi has been successful in effecting a reconciliation between Wali Mahommed and Hashim Khan, each promising to support the other, should either be made Ameer. This understanding is, no doubt, in a great measure brought about through their mutual fear of Sirdar Abdur Rahman Khan, whose near approach is creating great excitement and anxiety in the city.

It is expected Mahommed Jan will break with his kinsmen and the Cabul Sirdars, and join Abdur Rahman.

From Kohistan, the news comes in that ten thousand men are at Kilar Khoja Khidra, South-East of Charikar, under the command of Mir Inan and Mir Abbas.

Sirdar Abdul Rahman is daily expected in Kohistan, and report says that he has secured the support of Khoja Jan, Mir Butcha, Surwar Khan, Butcha-i-I-Jan, Murtsza, and all the chiefs of the Koh-i-Daman and Kohistan.

These chiefs have declared that they welcome him back as their Sovereign, and will have nothing to do with the pretensions of Mahommed Jan, Musa Khan, or Yakoob Khan.

Cabul, April 15th.—Sirdar Abdul Rahman's appeal to the chiefs, to aid him in a holy war, is being circulated broadcast all over the country. He declares he is the only rightful Sovereign, and claims the whole country as its Ameer; and says his success in Turkestan is evidence that all the country North of the Hindu Koosh has accepted him. Great excitement prevails at Cabul regarding his movements. The Hindu traders, who fear disturbances, have deposited eight lakhs of rupees with us in Shorapore for safe keeping.

The Mullicks, with their followers, left the city yesterday, and Sirdars Tahir Khan, Alam Khan, and Surwar Khan this morning, for Maidan. It is believed that all have promised to prevent further opposition, and to aid us to bring about a peaceful and satisfactory settlement; but the value of these pledges is not considered to be very great.

Cabul, April 16th.—General Ross's force, consisting of nearly 4,000 men, left to-day for Kila Kazi, their first halting place. The second day's march will be to Argandeh; third to Maidan, where further orders will await them.

Rangoon, April 15th.—Mandalay news is most conflicting. King Theebaw was alive on the 7th. The priests in large numbers are leaving Mandalay, as they did when the late king was dying. All houses are closed at Mandalay at sundown, on account of the terror inspired by the human sacrifices offered up last week in large numbers.

Kabul, April 16th.—The troops under General Ross marched this morning at eight. General Roberts rode out as far as Kila Kazi, the first march, and returns to-morrow. Mahomed Jan, it is reported, has fled in the direction of Ghuzni. All chances of any hostile combination are very small. There are reports that Mahomed Hassan Khan is in Logar and means mischief, but they are not credited.

Kabul, April 17th.—General Roberts returned from Kila Kazi this morning. General Ross reached Argandeh to-day. All is quiet in the Chardah Valley. The Argundeh Kotals have been deserted by Mahomed Jan's men, and the impression is that no opposition will be offered. General Ross will advance as far as Maidan, but there is a possibility of an attack between there and Shekhabad. Mahomed Hassan Khan may attempt to raise Logaris, but he is not expected to succeed in getting a large number. Mahomed Jan is reported to have reached Shashgao, and to have sent letters to the different chiefs of Kohistan urging them to despatch as many men as possible. From Chazai a large number of Chazis, lately in the city, have left, and have dispersed. Forty Artillerymen, for service with the captured guns, arrived to-day. The General Hospital is moving to-day from Sherpur to Siala Sung. Last night the telegraph wire was cut between Pezwan and Jagdalak, and a large quantity of the wire carried off, and all messages are forwarded by post from Jagdalak over the damaged section. The weather is becoming much warmer.

Jellalabad, April 17th.—The column lately operating in in Hisarak has returned to Pezwan, after destroying five of the towers in Maizoolah Khan's villages. When withdrawing, the enemy followed close upon the rear-guard, wounding several. General Bright, with the divisional staff, returns to Sufed Sang. All is quite in Englishman.

Bombay, April 19th.—The *Bombay Gazette* publishes a telegram from its Quetta correspondent to the effect that an official and six men of the 19th Bombay Infantry are reported to have been massacred beyond Chaman by 1,500 Pathans. General Burrows reports that 1,000 Pathans are moving parallel to him, apparently meaning mischief. The enemy is reported to be blocking the road to Kandahar. The telegraph to Kandahar is cut, and anxiety is felt about the Bolan Pass.

Quetta, April 19th.—It is reported, on good authority, that Major S. J. Waudby, Officiating Commandant of the Bombay Native Infantry, was killed the night before last,

at a small Commissariat post beyond Chaman, which was attacked by large numbers of the enemy, of whom it is said that Major Waudby alone shot seventeen, and speared four or five. He had with him only four or five soldiers, and some Pathan levies.

Simla, April 20th.—From Cabul, the present news is that General Ross has marched to Maidan without opposition. It is as yet uncertain whether his further progress will be opposed. From the Kohistan, the principal chiefs, including some of those hitherto hostile, have come in to Cabul. There is some movement of the tribes on the North Bank of the Cabul river, in the Kunar country, apparently caused by intertribal-dissensions. The leaders of the sections hostile to British interests seem disposed to threaten the Kunar chief.

A raid was made early on Saturday morning, on the post of Dubrai, 28 miles on the Candahar side of Chaman and 50 miles from Candahar, in which Major Waudby, of the Bombay army, recently appointed road commandant, lost his life. A duffadar and private of the Sindhi Horse, and two privates of the 19th Bu. N.I., his orderlies, were killed with him, also a Commissariat Agent and several Candaharies employed in postal and Commissariat service, eighteen in all. A third sowar and some others escaped. The post was guarded by the local police only, several of whom are also believed to have been killed. Details are as yet insufficient, but thirteen of the assailants are said to have lost their lives.

The attack took place about midnight. Major Waudby had been warned at 5 p.m. of an intended attack, but would not leave the Commissariat depot to be plundered; communication was re-opened on Sunday by parties from both sides. After firing the wood and forage stocks and taking what plunder they could, the Ghazis dispersed.

#### THE JAPANESE PRESS.

##### THE SUSPENSION OF THE MAINICHI SHIMBUN.

THE *Tokio-Yokohama Mainichi Shimbun* published an announcement on the 12th instant that, in conformity with orders received from authority, it had suspended publication. The conductors expect that the embargo will be removed in a few days, and request that, on the resumption of issue by the paper, subscribers will support them, as before. The article which is supposed to have evoked the order for suspension is headed "Mr. Inouye's mission to China." It was originally intended and announced "to be continued." The present instalment runs, almost literally, as follows:—

We have already learned through different newspapers that Mr. Inouye, First Secretary to the Cabinet, has proceeded on a mission to China. As regards the object of his expedition, various opinions have been formed both among Japanese and foreigners. Some say that "Mr. Inouye's mission to China is to form a defensive alliance between that country and Japan against Russia," while others hold that the design is not to form an alliance between Japan and China but to close the Loochoo question; and that "the Japanese Government, availing itself of the opportunity of the dispute between Russia and China, has secretly determined to settle that question. It proposes to hand over one of the Loochoo islands to China, and keep the rest in possession of the Japanese Government. It is said that, with this proposal on the part of Japan, Viceroy Li is very willing to comply." We cannot easily ascertain the facts of diplomacy, but, in the present state of affairs we do not venture to say that such might not be the case. If it really were so, the fact would, to no small extent, affect the honour and peace of our country in future. How then is it possible for our countrymen to pass the question without comment? As to the relative position of Japan and China, we find that they are neighbours, speaking different languages; but that they have the same literature and religion. Therefore, intercourse between Japan and China should, of course, be intimate; but when it is question of a defensive alliance, though China should demand it, yet we should not comply with the request. If our country should

enter into a defensive alliance with China, each promising to assist the other, every movement in the adjacent Empire would always affect us. This Empire would be rendered unable to enjoy permanent peace. Consider the present condition of China. Within it exist two political parties. The liberals are but little cognizant of the present state of the world, while the opposite party is composed of obstinate and ignorant people who condemn foreigners as barbarians, and care naught for the peace of their country. They always clamor for war; and it is avowed that they deliberately insist upon war with Russia at the present moment. The populace generally look upon foreigners as devils; and yet the country cannot liberate itself from the pressure put upon it by foreign Governments. If the Kulja affair should unfortunately result in war, some years would elapse before we could see the conclusion of strife. Such being the case with the China of to-day, if we should enter into a defensive alliance with her,—an alliance implying mutual assistance,—how would it be possible for our compatriots to enjoy one peaceful day? Regarding the past movements of our Government, we see that it has always adopted peaceful and not warlike measures; therefore we believe that the object of Mr. Secretary Inouye's present mission to China is not to form a defensive alliance. If, however, the Government should have despatched an Envoy for such a purpose, our countrymen ought to point out the error of the course, and suggest means for setting our Empire firmly at peace.

Let us then suppose that Mr. Inouye's trip to China has nothing to do with a proposed defensive alliance between Japan and that nation. It might then be possible that his aim would be to adjust the Loochoo question, and that our proposal might be to hand one of the islands to the Chinese Government? Such a suggestion ought to be scouted by our fellow-countrymen; and the Government, consisting of wise and able functionaries, we believe, would not commit such a mistaken act of policy. Nevertheless, as the Loochoo question has troubled both the Japanese and the Chinese Governments ever since last year, we do not venture to say that Mr. Inouye's mission is not for the purpose stated. If so, our Government would incur the odium of tyranny, and otherwise be put to shame in the sight of other countries. What do we mean by speaking of a tyrannical Government? We reply that we do not wish our country to be called the Russia of the Far East. In the good old times, Russia took advantage of the small and powerless state of her neighbour, Poland, and treated her cruelly. When Poland rose against Russia, the latter immediately occupied the territory of the former by force of arms, slaughtered her people, gave one-tenth of her land to Prussia and Austria to divide between them, and retained nine-tenths for herself. Thus she made herself known to the whole world as an oppressive nation. Even at the present day, if any one talks about aggression he will always take Russia for an example. The Government of Russia has lost the confidence of the world. If our rulers now want to divide the Loochoo islands with China, securing nine-tenths for themselves, we say that they look upon Loochoo as Russia looked upon Poland, and are desirous to follow a vile example. In reading history, when we come to a chapter treating of Russia making partition of Poland with other countries, we always pity the unhappy Poles, and shudder at the tyrannical administration of Russia. If our Government is going to cut up Loochoo between Japan and China, it will not be able to rid itself of the title of an aggressor. Is this not a matter for great consideration? According to what we have heard of the negotiations which have been pending between our cabinet and that of China ever since last year, Loochoo does not stand in such a relation towards either country as Poland did to other European nations, being a mere dependency of Japan. If what our Government produced in evidence is true, the whole of these islands belongs to us. Then if we were to cede even an inch of land to China, we should tarnish the honour of our country. It would be quite as unreasonable for Japan to yield a part of Loochoo, as it would be for China to take it. Our ministry ought to explain the distinction between what is right and what wrong to the Chinese authorities, in order to prevent them claiming land which is not due to them. If the Japanese Government should sur-

render part of its dependency to the Chinese Government without reason, Japan would then be despised by all foreign countries, who would deem her cowardly, and think that, if they were to threaten her with invasion, they could take possession of her land, her Government, and people. From that time forth, she would lose her sovereign right. Hence, even if Mr. Inouye's mission to China were to enter into a defensive alliance, the achievement would bring no advantage to our Government. As regards the conclusion of the Loochoo question, if it should imply a partition of territory, it had better be left alone by our Empire. If the cabinet desires to secure peace with China by ceding a portion of our land, the question arises, what portion of our land does it propose to cede? To avoid dismissing the Loochoo question carelessly we shall, in our next issue, by a precise description of the natural features and products of the southern Loochoo isles, show reason why we should not surrender as much as an inch of land in the whole group.

### A GOVERNMENT GAZETTE.

(Translated from the *Choya Shimbun*.)

IT is now currently reported that the Government is shortly going to establish an official organ under the name of the "Government Gazette" or some similar designation, and that it will be issued daily. If this report be true, we see that the authorities, following the example of the different States in Europe, are going to protect the interests of the Government, and defend their policy through the medium of an official journal. This is undoubtedly the custom in civilized countries, and affords a means by which the people are readily made aware of the will of the ruling power. We are therefore highly pleased to see such a proceeding on the part of the Government, and suggest that the authorities should take the necessary preliminary measures at once.

From the olden times, nothing has been more serious as regards a prejudicial effect upon the administration of a country, than a wide gulf and want of communication between the Government and the people. Therefore we find, that wise and able monarchs in the past have all tried to modify the bad effects of such a system. In our own times the publication of newspapers and the delivery of lectures are everywhere carried on in the civilized States of Europe and America, and this is simply because both the Government and people express their opinions freely, and never harbour suspicious thoughts of each other, but labour together in order to advance the interests of their mutual countries. The number of newspapers published in Japan is not small, and their influence is increasing more and more, day by day, and month by month. It is a great honour to our country that we do not allow the local European and American papers to alone exercise influence here at present. However, all our journals have been established by private individuals; therefore their principal aim is, as a rule, to represent the opinion of the public. The *Tokio Nichi Nichi Shimbun* always used to defend the policy of the Government, and indirectly announce the will of the authorities, but that paper is not a regular official journal, and we cannot take all its statements as expressing the views of the Government. Again, it is said that the *Hochi Shimbun* represents the Finance Department, but it is evident that this cannot always be the case. The *Nichi Nichi Shimbun* is not a properly recognized official organ, nor the *Hochi Shimbun* a representative of the Finance Department. How then can the people become definitely acquainted with the policy and will of the Government upon any particular subject? We have long regretted that, although the Government has had ample means of ascertaining the views of the people, the latter have no opportunity of becoming aware of the wishes of their rulers. Now, however, the authorities have directed their attention to this matter, and are going to publish a Government Gazette, and when this is done, the benefit to be derived therefrom will not be small.

However, those who are not aware of the circumstances, say in their ignorance that through such a process the Government desires to act tyrannically, and suppress a due exposition of public opinion, and that by publishing its policy openly, it wants to hoodwink the public. Ah!

what an inconsistent idea! The opinions of every individual are free, and he believes as he thinks right, while others may entertain contrary views. The Liberals and the Conservatives are divided in their opinions, each party believing in its own principles; as to their thoughts, no one can change them by force; argument is the only effectual weapon, because the intellect alone is to be influenced.

The inconsistent idea which we have quoted, is founded upon the assumption that the object of our Government in publishing an official paper, is to suppress all opinions adverse to its own views, and, if necessary, to alter the intellectual conclusions arrived at by the whole community, so as to make them the same as its own. Who can hope to carry into effect such an impossible plan? Therefore we know that such is not the object of our Government in establishing an official organ.

But let us, for the sake of argument, suppose that the Government is going to publish an official paper with such an object. By what means does it propose to suppress public opinion, and control the minds of the community? Will the authorities treat those who attack or criticise the official paper as libelling the Government? Will it punish without mercy whoever assails its paper? This course would be too tyrannical to impress the public favourably, and it is quite clear that our present Government would not attempt any such useless measure. Does the Government wish to confound all opponents by means of the eloquence of its paper, so as to cause the public to trust entirely in the official journal? This is partial, and if other papers are trusted by the public for the soundness of their views, their readers, being gifted with knowledge to distinguish what is right from what is wrong, will not be misled by the eloquence of the official organ.

Regard the condition of the different States of Europe and America. The newspapers there belong to different political parties, and they each express opinions on behalf of their respective supporters. They are always attacking each other, never surrendering, and an official paper also takes a part in the general engagement. The object of the establishment of the official organ is to defend the policy of its Government, and to make its will known to the people, but not to suppress or unduly influence the public or the rights of the community at large. Therefore, though other papers may attack the official paper, the Government never interferes, and, on the other hand, though the official paper may criticise its opponents they never feel ill-pleased. Why is this so? Because the official journal only reasons about the will of the Government, and makes it clearly known to the people, leaving approval or disapproval entirely to the judgment of the public; and, at the same time, the other papers are published with a similar object as regards the parties they represent, and do not try to force others to their own way of thinking. We are of opinion that the purpose of our Government in publishing an official paper, is only to follow the good example of the different States of Europe; and therefore, although other papers holding different views may assail it, we earnestly believe that the authorities will not interfere.

#### TO OUR PATRIOTIC BRETHREN.

(Translated from the *Akebono Shimbu*.)

"THE Alps shall not bar our progress," was the answer given by that mighty warrior Napoleon, I. to his officers, who pointed out to him the great mountain barrier intercepting their triumphant march to the plunder of the smiling plains of Italy. "The word 'cannot' exists only in the dictionary of fools," remarked this wonderful genius on another occasion, thus evidencing the indomitable will of the great hero and ruler of modern times. Napoleon alone could have given expression to such thoughts, and there was one saying in particular which he frequently repeated:—"A daring mind is the truest intellect." From these remarks historians have concluded that it was Napoleon's brave and audacious character that enabled him to achieve the great deeds which he accomplished.

The example of the Great Emperor is useful at the present time. It shows that those who have an important object to attain should not recognize the possibility of ultimate failure, and our patriots should continually keep in mind the words of Napoleon:—"The Alps shall not bar our

progress," and:—"The word 'cannot' exists only in the dictionary of fools."

In the existing condition of Japan political questions are everywhere discussed, and many memorials have been forwarded to the Government respecting the establishment of a national assembly. In fact, matters have arrived at a stage that nothing but an alteration in the form of government will satisfy the people. The regulations recently issued respecting political meetings are, however, like an iron chain controlling the liberty of discussing public questions, and we must therefore consider what thoughts our patriots should harbour, and if they should abandon their desires now that the new regulations have been issued. It is true that a rumour is current that this recent legislation is to be altered, but whether it is to be made more or less stringent, we are wholly unable to say. We do know, however, that before the issue of these rules lectures on political subjects were occasionally delivered in Tokio; now they have been entirely put a stop to, and we learn that such has been the case in the provinces also.

The new regulations do not actually forbid political lectures entirely, but they so limit the persons who may attend, and prohibit due publicity being given, that the lecturers find they may just as well close the doors at once and cork up their mouths. Should the lecturers rest content, treating the matter as inevitable? Will corking up their mouths and controlling their tongues not have the effect of exciting their feelings? The applicants for the establishment of a national assembly have distributed circulars among the public, and despatched emissaries in all directions inviting the people to join them, and they are also endeavouring to establish a union between the different societies which have a common object. These measures, however, have been forbidden by the regulations, and the question arises, should the societies abandon their designs or should the prohibitive regulations only excite their opposition and stir them up to greater exertions in order to accomplish the grand object of their desires?

If these regulations perchance prove the means of encouraging our patriots to stand firm, we then say that the sentence, "the Alps shall not bar our progress," should be constantly in their minds, that the word "cannot" should be swept away from their recollection, and that they should not allow themselves to be classed among the fools spoken of by the Great Napoleon. If, however, those who have now taken political matters in hand become discouraged by the issue of the recent regulations, and gradually abandon their designs for the amelioration of the state, we must then say that they have been thwarted by the Alpine barrier of the regulations, and that the word "cannot" still remains vivid in their minds. If our patriots prove such hesitating cowards, to whom shall we turn for advice respecting the future welfare of the Japanese Empire?

The water in a stream which is without a source can be readily stopped by a piece of wood, but the current in a mighty river cannot be controlled. It must be allowed to take its own course, and embankments are powerless to hinder its resistless progress: if we try to repress it, we only sustain damage from the resulting flood.

Having observed that our patriots have become enthusiastic upon the subject of a national assembly, and that the reason why different associations have forwarded memorials to the Government demanding representative institutions is because they have come to a conclusion that the future state of our country imperatively requires such an alteration in the law, who then can deny that the will of the memorialists is as powerful as the current of a great river? We place sincere confidence in the patriots who are agitating this matter, and if they do not act contrary to our expectation, the Government will at last find it absolutely necessary to comply with their requests, just as the Alps could not prevent Napoleon's onward march.

According to what we have heard, after the regulations were issued, some people established a school under the name of the *Minken Gakko* (school for demonstrating the popular rights) while others again became much more resolute in their determination than before. If such were the case, our patriots should stand fast and not be discouraged by the recent legislation. We feel assured that they will not act contrary to the expectation we have formed. We now wish to advise them to continually bear

in mind that "a daring mind is the truest intellect;" and they should forget such a word as "cannot." Encouraged by the brave words, "the Alps shall not bar our progress," they will toil on actively and patiently like true men of Nippon, until the grand object of their labours and sacrifices is triumphantly attained.

## MURDER ON BOARD THE *BULLION*.

### INQUEST.

An inquest was held on Monday forenoon, before General T. B. Van Buren, United States Consul-General, sitting as coroner, and Messrs. Haswell and Smith, jurors, to inquire into the cause of death of Robert Kelly, second mate of the American ship *Bullion*.

John P. Reed, master of the *Bullion* being sworn, said: Yesterday morning, between three and four o'clock, I was called from my cabin by one of the seamen named Samuel Scott, who said: "Come up, captain, Jack has stabbed Mr. Kelly in the neck." I took my rifle and went on deck. In the galley I found Mr. Kelly lying dead. I asked for Jack, and was told he was in the fore-castle. I went there and called him, and he came to the door, holding out his arms for me to put the irons on him. The irons were put on, and he was put in the house forward. He made a threat that he would kill the cook if he got a chance. I then went to the U. S. Consulate and reported the matter. The deputy marshal, a police officer, and the undertaker were sent on board. They took Ross on shore and locked him up in the gaol. Dr. Tripler saw deceased before he was taken ashore. The body was then lying in the coffin. The undertaker put the body in the coffin in my presence. The doctor examined the wounds. The coffin was nailed up and passed over the side by the crew into a sampan, and taken ashore by the undertaker. When I got on deck the affray was over and Kelly dead. I was asleep when called. I do not know of any bad feeling between the deceased and Ross previously. They went on shore together. I did not see any liquor on board. Ross was about half intoxicated when taken on shore by the consular officers.

Samuel Scott, being sworn, said: I am an able seaman on board the *Bullion*. About half-past three o'clock on Sunday morning I was on board and just about making some coffee for the captain, when Kelly, the stewardess, and the cook came on board from ashore together. I asked the stewardess to open the pantry so that I could get the coffee pot. She did so, and said I was to make tea, as there was no coffee. I went into the pantry, and the second mate came and asked me to give him something to eat. He took a plate of beef and potatoes and went into the galley. When I went to the galley I found him eating the food and leaning with one arm on the dresser. Then John Ross came on board and went into the galley, and said to the mate, "I'll pay you for this at daylight." I cannot say whether he was drunk or not, but he walked from the ship's side with a bunch of flowers in his hand to the fore-castle. He took off the clothes he had on ashore, and returned to the galley and said to Mr. Kelly, "Are you as good a man now as you were ashore?" The mate said, "go away man, go away." Ross then stabbed him in the neck with a sheath knife, and he fell upon my shoulder, exclaiming, "Sam, Sam." The blood spread all over the place. Ross stabbed the mate once, and as he was making a second blow I ran aft to call the captain. When I returned Kelly was dead, and Ross had gone to the fore-castle. I do not know whether the mate and Ross went ashore together. I never heard of there being any bad blood between them.

Charles Broom, being sworn, said: I am cook on board the *Bullion*. I was ashore with the second mate and John Ross on Saturday last. I had been on shore two days. I met Kelly and Ross at the "Shamrock," kept by Mrs. Glass. I was there when Kelly and Ross came in and asked for drinks. Ross asked me to have a drink, and I had lemonade. He took gin, I think, Ross and I then played cards. Kelly was sitting talking. We then had a drink together. Kelly took me on one side and said, "I'm going to lick John Ross to-night." I said, "You'll do no such thing." Ross went out alone. I then said to Kelly and the stewardess, "It's time we went on board." We then went down to

the boats. The second mate said: "There's John Ross coming down," and he pulled off his coat. Ross had his coat off, and made for Kelly. Ross knocked Kelly down. I said, "No fighting here, Sir." I caught hold of Ross and pulled him off Kelly. Ross was then lying on top of Kelly. Ross then called me out of my name, and struck me in the stomach. This was on the English Hatohm. I fell and bruised my leg. Kelly got up and knocked down Ross and kicked him. I was not fighting. I said, "Let us go on board now." Kelly said, "No, there will be a row on board, and all hands will be bad." Then Kelly, my wife and I went up town again. Kelly had a glass of brandy at a Japanese house. Afterwards we went to the "California Saloon." Kelly took us there. The chief officer of the *Charles Dennis* was there also, and we all returned on board at about half-past two o'clock, leaving the officer of the *Charles Dennis* at his ship. I went to sleep. I do not know why Kelly said he would whip Ross. I am not aware of there being any bad blood between them. When I asked Kelly why he was going to beat Ross he replied,—"There is something between us that is none of your business."

William Thomas, being sworn, said:—I am an able seaman on board the *Bullion*. On Saturday morning, after turning to after breakfast, I was sent by the mate to the lighter alongside, to rig a purchase. Ross came shortly after to help me. He said:—"George, are you going to ask the captain for your discharge again to-night?" I replied, "No, because I know it's no use." He said:—"I'm going to ask for mine, and my money also, and if he will not give it I'll see the Consul. I'm bound to go on shore to-night, money or no money. I made a promise to meet certain parties ashore to-night, and there's a woman mixed up in it." I advised him to stay on board. I was working with Kelly in the afternoon, and he said he was going ashore, as he had parties to meet. I heard nothing more until about four o'clock yesterday morning, when I heard Ross say, "Mr. Kelly, you'll pay for this at daylight." I did not hear Kelly reply, and Ross came forward to the fore-castle. The distance between the galley and the fore-castle is short. There is a carpenter's shop between them. Ross came straight to my bunk and shook me. He had in one hand a lemonade bottle, about three parts full of whisky. He said, "George, I brought this on board to be drunk, and you have to drink it." I returned him the bottle, as I could not get the cork out. He took the cork out, and told me to drink, and began to change his clothes. Ross was not drunk. After he took his coat off he placed his hands on my bunk and said:—"Those two—tried to lick me, but they can't do it yet. I'll make them pay for it." After he finished putting on his old clothes he put on his belt with his sheath knife, and walked out of the fore-castle, rolling up his sleeves and saying:—"Now it's him and me for it." I next heard him say:—"Now Kelly, if you are as good a man as you were ashore, come out on the main deck." I heard no reply from Kelly, Ross said:—"I'll cut the Irish heart out of you, G—d— you." I heard nothing more. Ross came back to the fore-castle with the knife in his hand, and drew it first one side and then the other across his palm, and said, "Look there George, there's his heart's blood." I saw blood on his hand. He placed the knife on the beam over his bunk. I then went to the galley door and saw Bennett turning Kelly on his back. I went and got the knife and stowed it away. Ross said, "If that Dutch—was on board I'd serve him the same." The captain then came forward and put Ross in irons. The knife produced is the one Ross had. When the captain called Ross, the latter said, "Here you are, captain, put them on yourself." Seeing the captain had a rifle, he caught hold of the barrel, and said:—"Don't shoot anybody, I want my coat." He was ironed and put in the carpenter's shop.

Adjourned until 2 o'clock.

On the Court resuming.

Thomas Tripler being sworn stated:—I am a physician practising in Yokohama. I was on board the *Bullion* yesterday morning and there examined the body of Mr. Kelly, the 2nd mate. I found on the left forearm a wound evidently made with a knife, a wound upon the left cheek made with the same weapon, and a deep wound on the neck also evidently done with a knife. The wound in the neck was about three inches in extent and divided the left common carotid artery and the left internal jugular vein. The

man's death was caused by hæmorrhage from the artery and vein in the neck. The man was dead long before I saw him. He may have lived a couple of minutes after being stabbed. The wound in the forearm was about four inches long and went down to the bone.

G. W. Elmer being sworn stated:—I am Deputy Marshall in the United States Consulate. Yesterday morning about a quarter to five o'clock, the captain of the *Bullion* came and told me that one of his men named Jack had stabbed and killed the second mate and asked me to arrest him. I at once consulted the Consul-General, and was ordered to arrest the murderer, and have the dead body brought ashore by an undertaker. I then went on board the *Bullion* accompanied by police constable Hazel and Mr. Butland, the undertaker. We first went to the galley, and just inside the door on the port side found the body of Mr. Kelly, lying on its back. The wounds were as described by the last witness. I caused the body to be placed on the main hatch and gave it in charge to the undertaker. I then went to where Ross was confined, and found him lying on his back with his hands ironed behind him. He was very noisy and threatening to "do" for someone else. He was partly drunk and seemed as if the drink was beginning to take effect upon him. He was quite drunk, sleepy drunk, by the time we got him ashore. I asked him if he knew we were taking him ashore for having killed the second mate. He replied yes, the second mate and the cook had tried to murder him on shore by beating and kicking him. When taken out of the carpenter's shop he called out that he would kill the cook the first time he got a chance. We uncovered the body as it lay on the hatch to shew it to him; and one of the men said:—"You see what you've done?" He said:—"Yes, that's all right. Let me shake hands with him. I'm friends with him now as I was before. He was the best friend I had." While going ashore he admitted killing the mate but tried to defend his conduct. When we got him close to the *Hatoba* he hung his head down and seemed to be thinking, and muttered to himself:—"I killed Kelly? I could not have done it when I went on board. I went to the fore-castle and had a drink and then I went to the galley. Yes, that must be when I did it. I would not have stabbed him if he had not had a knife in his hand." I found meat and bread on a plate in the galley all covered with blood. There was also a case knife and a long carving knife; the former was greasy and the latter unsoiled. I examined Ross's bunk, and found the knife produced sticking in a beam, a white shirt, and a suit of clothes with blood on them. The shirt is bloody all over and the sleeve looks as if a knife had been wiped on it. When Ross saw me making up the bundle he said:—"That blood was on those clothes before. That was from the mate and the cook kicking me." I examined Ross when he came ashore and he had no blood marks about his body. I also found in his bunk a lemonade bottle about one-third full of liquor of some kind. I left the bottle there. We brought him up from the *Hatoba* in a *jiuriksha*. Some one asked him why he was being taken to gaol. He then asked us:—"Where are you taking me to?" I said to gaol. He then asked:—"What for?" I replied for killing Kelly. He remarked:—"Me kill Kelly? I had no reason to kill Kelly. He was my best friend." He repeated that several times, and told us not to be joking with him; that it was nothing to joke about and that he would not hurt a child. He appeared very drunk when I got him to the gaol and he slept for seven or eight hours. When we were taking Ross over the side of the ship I said to him:—"There's the man you killed." He replied:—"Yes I killed him. I suppose I'll swing for it, but I don't care a damn."

J. P. Reed re-called: Ross was shipped in New York for the voyage. I know nothing of his nationality except what appears on the ship's articles. He is there stated to be an Englishman. He was shipped after clearing, as a substitute for another man. The ship was lying at anchor when the crime was committed.

The jurors then went to view the body of the deceased and on their return the following finding was announced:—

We, the jurors, having duly heard and considered the testimony presented on this hearing, and having viewed the body of the deceased, do hereby find that the deceased, Robert Kelly, late second mate of the American ship *Bullion*, came to his death in the galley of said ship on the morning

of the 9th instant, from wounds made by a knife in his neck and body; which wounds were given by John Ross, a seaman on said ship. And we further find that said killing was deliberate and malicious, and amounted to the crime of murder, and that said crime was committed on the ship *Bullion*, while she was lying in the harbour of Yokohama.

Approved,

THOS. B. VAN BUREN,  
Consul-General.

#### LAW REPORTS.

##### IN THE U. S. CONSULAR-GENERAL COURT.

Before General T. B. VAN BUREN, Consul-General.

Wednesday, 12th May, 1880.

John Martin Ross was charged with the murder of Robert Kelly, the second mate of the American ship *Bullion*.

Mr. G. W. Hill, being designated by the Court, at the request of the prisoner, to undertake his defence, applied that the papers be amended by the insertion of the full name of the accused. This was accordingly done.

His Honour then read the charge to the prisoner, which had been preferred by the captain of the *Bullion*.

Mr. Hill addressed the Court, and pointed out that the accused was a British subject, and that he was prepared to verify the statement by the affidavit of the prisoner.

An affidavit by the prisoner was accordingly made and put in evidence. This document stated that the deponent was about twenty-eight years of age, and was born at Prince Edward's Island, Nova Scotia.

Mr. Hill then read a motion founded upon the affidavit which the prisoner signed. This motion was to the effect that the Court had no jurisdiction over him, and demanding his immediate and absolute discharge.

His Honour remarked that he certainly would not order the man's discharge, but as the question involved was an important one he would take time to consider it. As far as he was inclined to think at present, the Court had no jurisdiction in the matter, but he would continue the case for a few days, and give notice to counsel when he was prepared to give a decision on the point involved.

#### DOUBLE ACROSTIC.

Ah, pleasant outcome of these summer days!  
How can my pen presume to sing thy praise?

1.

Used as a plaything by both old and young,  
And, like a chant, it may be said or sung.

2.

Music and medicine thus go arm in arm—  
Re-dress all strains, to ear and limb give balm.

3.

That one man's poison is another's meat  
Is freely shown when bar and client meet.

4.

On foot he standeth fast and shoots with grace;  
Mounted, he sitteth fast and wins the race.

5.

In olden days this caused pain and strife:  
Now, it is sought and found in charming wife.

## CHESS PROBLEM,

BY G. N. CHENEY.

BLACK.

WHITE.

White to play and mate in three moves.

SOLUTION OF CHESS PROBLEM, OF MAY 5TH, BY W. H. TAYLOR.

White. Black.  
1.—Q. to Q. 3. 2.—Any.  
3.—mate.

The solution of last week's problem is held over by request.

## METEOROLOGICAL REPORT

FOR WEEK BEGINNING FRIDAY, MAY 7TH, 1880.

Observatory of Daigaku, Moto-Fujicho, Hongō, Tokio, Japan.

## REMARKS.

Heavy line represents barometer.

Light continuous line—max. &amp; min. thermometers.

Dotted line—percentage of humidity

Dashed line—represents velocity of wind

Max. velocity of wind 21.5 miles per hour on Friday, at 4 a.m.

The barometer is reduced to the freezing point and to the level of the sea.

The highest reading of the barometer for the week was 30.038 inches on Sunday, at 7 a.m., and the lowest was 29.449 on Friday, at 7 a.m. A low barometer has ruled throughout the week. The maximum temperature reached was 77° 8 on Tuesday. The range of temperature for that day was 23° 3, while for the day previous it was only about 4° 5. The total rain for the week was 3.66 inches—nearly all of which, as will be observed, fell on Friday.

## SHIPPING INTELLIGENCE.

Newchwang Peas ... .. picul	\$2.20

**EXPORTS.**

**SILK.**—We have another very quiet week to report in Silk, sales amounting to about 50 shipping bales only. The crop here is, from all accounts, progressing fairly well. There were some reports of damage done by frost to the mulberry leaves, but they were evidently much exaggerated. Prices are to a great extent nominal.

Stock 2,300 Japanese bales.

Total shipments to date 17,601 bales against 17,897 bales at the same period last season.

	In London at 3/11½ per lb.	In Lyons at fr. 5.02 per kilo.		In London at 3/11½ per lb.	In Lyons at fr. 5.02 per kilo.

## THE TRADE OF HIOGO.

WITH customary exhaustiveness and accuracy, Her Majesty's Consul at Hiogo and Osaka has published the report on the trade of those ports for 1879. Mr. Aston, who has quite recently taken charge of the establishment and whose material must have been left well ready to his hand by his industrious predecessor, notes that the improvement in the commerce of Hiogo observed in the previous twelve-monthly statement, had continued. The Custom House Returns for 1879 demonstrated an increase of \$770,013 on the aggregate sum of exports and imports during the preceding year, which in its turn had been more productive of results than any of its predecessors since the opening of the port in 1868. The increase in imports, total value \$7,051,154, amounted to \$1,665,057,—a very considerable sum,—and is distributed over every class of imports. Cotton manufactures had augmented from \$1,540,298 in 1878 to 1,965,721 in 1879; woollen manufactures from \$1,608,551 to 1,684,014; and metals and miscellaneous foreign eastern produce, had also advanced extensively. "Woollen and cotton manufactures showed a relatively larger increase than any other goods, or from \$48,122 to 175,062. Exports, on the other hand, have shown a diminution in value, a fact that is more than accounted for by the almost entire cessation of the export of rice, the diminution in this article alone having amounted to not less than \$2,381,740," Mr. Aston says that, "as pointed out in the report for 1878, the trade in rice is chiefly conducted under the auspices of the native Government, and the large increase in the returns for that year can therefore scarcely be regarded as a natural growth of healthy trade. If the item of rice is omitted, the totals of exports for 1878 and 1879 are \$3,896,107 and \$5,889,683, showing a balance of

\$1,443,576 in favour of the latter year. This increase is principally owing to the active demand for tea from America which has sprung up in the improved condition of trade in that country, but it extends to the export trade generally, with the exception of copper, in which there has been a considerable falling off." We are told, further, that "the value of tea exported during the year has been much under-estimated in the Customs returns, which give merely the value declared by the exporter. The Chamber of Commerce estimate, which has been carefully compiled from the records of the American Consulate, amounts to \$3,592,100, or \$824,416 more than the Customs calculation. Taking this estimate, which is a little too high, as it comprises the Customs duties, it results that the export trade for the year has not sensibly diminished, notwithstanding the cessation of the trade in rice." The Customs duties collected during the year demonstratively indicate a collective increase of more than ninety thousand dollars, pointing to the satisfactory conclusion that the trade for the year, "both export and import, has been on the whole a healthy one, and remunerative to all concerned, and it is gratifying to be able to add that persons well qualified to give an opinion are sanguine of even more favourable results for the year which has now begun." The next annual consular report must inevitably demonstrate a marked augmentation in the results of both outward and inward commerce through the establishment of the line of traffic by Mitsui Bishi steamers via the Inland Sea. The present compilation shows a net increase in imports of \$745,200: a net decrease in exports of \$744,200. The silk trade had retrograded from \$46,000 in 1878 to \$13,000 in 1879, while tea had advanced from \$2,204,600 to \$3,592,100. Copper and rice export value had both largely decreased. Still the general character of the trade of the port is evidently sound, although the indirect trade is on the decline. One would think that this is exactly what the Kobe merchants should desire. With reference to Mr. Iwasaki's enterprise, it should comfort them to learn already that "the opening of a fortnightly line of steamers direct to Hongkong in October last had some influence in this direction, and the returns for 1880 already show that a large development of the direct trade may be expected to result from this arrangement." However, there are other reasons for the falling off in indirect importation, as was shown by Mr. Flowers in the previous annual report from the same Consulate. He spoke of the inconvenience to native merchants of attending trade in distant markets, and the cost of transporting goods from Yokohama to the southern ports. These considerations should of themselves be sufficient to impel the mercantile community of Hiogo to do their best to develop their local trade and direct importation, the rather that "the tendency at present is towards greater mutual confidence between Japanese and foreign merchants, and goods are therefore more largely imported to order than heretofore." Among

the imported articles which are mentioned as showing an increase, Cotton Yarn figures conspicuously. As we indicated some time since this trade is capable of extensive development, the further communication with Bombay is rendered speedy and direct. The looms of Osaka need material, and can consume the more in proportion as the cost of transit and brokerage is diminished.

From Hiogo, tea continues to form the most important item of the export trade. The export for 1878 was: lbs. 10,245,898, value \$2,204,600; for 1879: lbs. 14,029,443, value \$3,592,100, showing an increase of lbs. 3,783,545, and of the value \$1,387,500. Of the total exported, lbs. 2,590,611 went to Canada, and the remainder to the United States. "The prices ruling have shewn an average increase of \$10.00 per picul over those ruling during the previous year, and as the quantity exported has also largely increased, the natives engaged in this industry must have made considerable profits. The produce of this district has doubled itself within the past three years, and the extent of ground being laid out in plantations is still largely on the increase. Owing to the high price of green teas, and the ill success of previous experiments in the manufacture of Congous, the latter have been comparatively neglected during the past year. The few small lots that were made, however, left so profitable a return to the shippers, that there is some prospect of further attempts to renew this industry."

The trade in tobacco has continued to languish, owing, it is stated, to the bulk of the growth having fallen into disfavour in Europe. On the other hand the exports of vegetable wax and camphor have increased in value, the demand for the former having exceeded that of the previous year by five times. A declension in the worth of the value of copper exported is attributed to the low prices ruling for the metal in European markets during the year. Antimony ore is noted as a comparatively new article of exportation, figuring in the present returns to the extent of eight hundred tons.

There is little of interest to European readers to notice in connection with the foreign trade of Osaka. It is said to be increasing; but "the imports consist chiefly of sugar, drugs and other Eastern produce, and the exports are mostly for the Chinese market. The entire trade is in the hands of native merchants. The aggregate value of imports and exports for the year is \$898,785 which shews an increase over 1878 of \$147,306." The good management of the postal service by officers of the Japanese Department is testified to; and the value of the new line of railway across the island, now in course of construction, admitted. We read that "The extension of the railway to Ootsu is expected to have an important influence in developing the trade of this part of Japan. Ootsu is situated at the Southern extremity of Lake Biwa, which provides water communication for fifty miles through one of the most productive districts in Japan. At present much of the silk and tea produced here finds its way to Yokkaichi, in the Owari bay, and thence to Yokohama, but it is probable that when these articles can be sent by railway instead of on pack-horses over the difficult mountain pass between Ootsu and Kioto, they will in future be forwarded to Kobe for exportation. The import trade will doubtless be also much benefited. A further extension of the railway from Naga-hama on Lake Biwa to Tsuruga, in Echizen, has been sanctioned, and it is expected that the works will be commenced very shortly. When it is completed there will be continuous communication by rail (except for about forty miles, which will be by steamer for the present) across the island, with a good harbour at each extremity.

The commercial importance of this line is therefore very considerable."

Three small sailing-vessels, one small steamer and two steam launches have been built at the Government Yard during the year; and in the same period seven steamers have been constructed at the Kobe Iron-works. On the whole the present makes, for the future of Osaka and Hiogo, promise which there is every reason to believe will be redeemed.

#### PUBLIC OPINION IN JAPAN.

NONE of the outward changes which separate the Japan of to-day from the Japan of twenty years ago are as suggestive and as indicative of the progress that has been accomplished, as is the spread of Public opinion, and the constantly increasing attention and importance which this new factor in the polity of the country acquires. Railroads, steamships, telegraphs and even lighthouses, are of themselves no definite means for gauging the advance made by the bulk of the population; they do not even furnish anything like an absolute standard whereby to measure industrial or mechanical progress. If in China the powers that be, influenced, perhaps, by the consideration of a possible conflict with Russia and the need of better means of transportation for troops and war material, were to order that ten or twenty millions should be expended for steamships and railroads, this would certainly not tend to show that the Chinese nation had made any considerable progress in the arts of civilization. Peru has in no sense become wiser, better, stronger or richer, since the construction of a stupendous network of railroads, which is far ahead of the needs of the country. The railroad between St. Petersburg and Moscow is a wonder and a triumph of engineering skill; but it in no way demonstrates that Russia's sons are superior to their forefathers in science and art, or even in topographical and engineering ability. The road was built as a military necessity, and when the foreigners engaged to construct it brought their different plans, showing how the nature of the intervening ground could best be utilized, and laid them before the Emperor Nicholas, the latter, rejecting all their proposals, took the map of Russia and drawing a straight line thereon between the two cities, said:—"Let this be the line of road!" And so it was built according to the Autocrat's order, regardless of the interests of contiguous towns and cities and of the country through which it passed, regardless even, to an incredible extent, of the obstacles imposed by nature—mountains and valleys, streams and rivers. This work, then, certainly is no exponent of the forward march of the nation. In Peru as well as in Russia improvements in transit capabilities were not, as for instance in England or the United States, the outcome of social needs rendered possible and made necessary by industrial progress, they were called into existence simply by the dictum of a military despot on the one hand and by caprice, not unmixed with baser motives of personal gain, on the other. Still, thinking men are well content to let the original motives be what they may; for the effect which follows the introduction of these great time and labor saving discoveries and inventions often gives birth to those phenomena which ought to have preceded them. Easier and freer intercourse of a people, both among themselves and with strangers, is one of the most powerful causes in promoting the spread of public opinion. In this regard there are many points of analogy between Japan and Russia. There, as well as here, for all the weight that attached

to it, public opinion might be said to have had no existence thirty years ago. In the land of the Czar it was the word of the latter spoken directly or by representatives selected by himself which governed the polity of the state; here it was a powerful oligarchy which, acting up to the letter of old and often vicious laws, obtained equally undisputed and unquestioning obedience, and stifled every expression of independent thought and feeling. The limits, however, were much narrower in Nippon than in Muscovy. With the subjects of imperious Nicholas it was almost exclusively the realm of government and politics which constituted forbidden ground for discussion. In the land of the Rising Sun the prohibition against innovation by action, by written or even spoken word, extended to every canon governing family and personal relations, to art, industry and manufactures, to mental and manual labour of every kind. The rigour and severity with which this policy—sying into the pettiest details of individual life—was carried out, often bordered on the ludicrous. The smile of good-humoured contempt, however, soon changes into an angry frown of just indignation when we read of the sad end which, as records tell us, invariably overtook him who laboured in untrodden fields, were he an abstruse thinker, a student of science or even an ingenious mechanic. We are here reminded of the fate of the man who constructed that wonderful piece of mechanism the clock of the Strasburg minster. The reward which he received from the Town Council was the cruel deprivation of sight in order that no other city should become the rival of Strasburg in the possession of a similar work. In Japan, innumerable instances of the same ingratitude can be found, not dictated by jealousy but simply by fear of innovation. The law was Draconic. Every reformer,—every one acting up to or even professing progressive ideas,—was doomed to torture or death, generally both. A few instances showing the extent to which this iniquity was carried may serve as not uninteresting illustrations.

The Tokio aqueduct, bringing water from the Tamagawa river, through a distance of about thirty miles, was built during the rule of the earlier Tokugawa Shoguns. It was hardly completed before the constructor was put into prison, where, according to common report, he ended his days. It was urged at the time that there were precedents to fully justify this harsh treatment; and among the instances cited was that of the water conduit leading from Imoto to Odawara. Many of the Yokohama residents in their trips to the Hakone hot springs will have noticed this conduit, which was formerly altogether subterranean, but portions of which have been laid bare by the building of the new road between the two places. It was constructed five or six hundred years ago in order to furnish to the castle of Odawara, in case of siege, a never-failing supply of water. To modern readers the idea of building such a tunnel appears extremely simple; but at that time it was considered a marvel of ingenuity, and the then lord of the province was struck with such jealous fears of the man who could project and execute such an undertaking, that he issued orders for his imprisonment and shortly afterwards for his death. The pathetic history of Sakura Sogoro, with which foreigners have been acquainted through Mr Mitford's admirable translation, is only a type of many others which, in Japan, are as familiar as household words. For daring to present a petition to the Shogun he was sentenced to the cruel death of crucifixion and spearing. The *manes* of this victim to jealous illiberalism ought to be appeased now when, as we read, over fifty petitions for the establishment of a Representative Assembly have been made to the Government, some

of them, like that of the Aikokusha, being addressed to the Mikado himself, their language, moreover, being in most instances vastly different from the tone of meek humility which characterized the poor old farmer's request.

High in the annals of Japan's progressive men stands the name of Rin Shihei, whose name is well known not only among students but to the people at large. He was born at Miyagi, in the province of Sendai, in the year 1787. From his earliest youth he was of an inquiring bias, never accepting stated results, but always looking to cause and effect. His genius lay mostly in the direction of military affairs. He explored the battle-fields of Japan; and by such light as he could gather from books and from oral testimony reviewed the old fights in their details, showing where either party might have been at fault and what strategical and other mistakes had been committed. He was a great traveller; and extraordinary reports of his pedestrian powers are still current among the people. Among other places which he had visited was Nagasaki, where, at Desima, he saw foreigners and foreign-built ships. His curiosity becoming excited he made his way over to Yezo, which Russian ships frequently visited, and there managed to gain a great deal of information about foreign countries and especially their methods of ship-building. Returning to Japan he published two books, named *Kaikoku Heidan* and *Sunkoku Tsuran*, in which he dealt with the advances made by foreign countries, and endeavoured to show what was needed to insure Japan's safety and preserve her from invasion. He had previously made a tour of the entire coast to determine the weak points and fix upon the best spot for fortifications. But his efforts were not appreciated. His books, which had found an immense sale, were confiscated, the plates broken, and he himself was thrown into prison, whence he never emerged. His only crime was that of daring to intimate that there was any system in Japan wherein reform was necessary.<sup>1</sup>

Between 1837 and 1840 there was published at Tokio a work called *Aobioshi*, which may be styled a compendium of the laws, regulations and customs of the feudal Government under the Tokugawa rule. Permission to issue the book had been received, although hampered by many limitations one of which was that not more than three hundred copies should be published. But even this authorization was afterwards recalled. The books were confiscated, the types, etc., were destroyed, and printers and publishers suffered imprisonment or death. The author, the Ason Fujiwara,—as his name indicates, a descendant of the royal house of Fujiwara,—holding high office in the Mikado's court, could not be so summarily death with, but the report is that he disappeared and was never subsequently heard of.

But it is needless to multiply instances, which in spite of the *Bakufu's* determination to suppress all particulars connected with such transactions, were too numerous to be passed over in silence. Nay, the folk-lore of the nation bears strong evidence of the rigorous policy; and native laborers and mechanics yet speak of the man who made the first watermill, the man who made the first movable stage on a theatre, and various other inventors having been "punished" with death. To be a reformer in any department, to go in the slightest degree beyond the antiquated ways of one's forefathers, meant, in Japan, to be a martyr; and no surprise can be felt that this country remained as conservative as it did: the wonder is rather that, age after age, men were found ready to suffer death and

<sup>1</sup> His fair fame has been re-habilitated. The Mikado during his progress through the country four years ago, while stopping at Miyagi, gave a sum of money to be expended in building a monument to his memory.

torture in the cause of progress. And the last few years have abundantly shown to the outside world that persecution has not extinguished this spirit, which had only slumbered, and that with the first rays of the new sun of comparative tolerance, it expanded into healthy, buoyant activity. In everything that concerns the weal and woe of the people the latter are making themselves heard. Newspapers, lecturers, and many different associations, formed on the plan of Western debating societies, deal with every topic of interest; and, in addition thereto, memorials on special momentous questions are continually being presented to those in authority. Then there is the public press, whose influence is making itself daily felt more and more. In our issue of the 8th instant, we gave particulars in regard to that institution, and need not here dilate upon its wonderful growth.

Public opinion has become a factor of primary importance in the councils of the nation; its influence has already for some time past made itself felt in everything that concerns internal legislation, and has received full and fair consideration from those in authority. Its ulterior effects in fixing the status of the country amongst the community of nations, and shaping the government policy in its relation with foreign powers, are only now developing themselves; but still there is ample and abundant evidence to show the strength of the new element and the influence which it must eventually command. The consideration of this phase of the question, however, would exceed the limits of one article and must be reserved for another issue.

WE have received from the Statistical Department of the Chinese Imperial Maritime Customs the abstract of trade and customs revenue statistics from 1867 to 1879. In the first mentioned year the value of the foreign trade of the empire for net imports,—that is the value of foreign goods imported direct from foreign countries, less the value of those re-exported,—was in Haikwan taels 62,459,226: exports 52,158,300. In 1879 it was *HK. tls.* 82,227,424, and 72,281,262 for imports and exports respectively. It is remarked, however, that the want of trade statistics at Hongkong makes the returns of the treaty ports but an approximate statement. The Customs income had increased from *HK. tls.* 8,864,817 in 1867 to 13,531,670 in 1879. These estimates include import, export and coast trade duties, as well as tonnage and transit dues. The Customs tael which is taken as a standard is equivalent in English money to 5s. 7½d.: in American gold to \$1.35; and in French money to frs. 7.10, at the average sight exchange on London, New York and Paris for 1879. The tabulation for eight years of the annual value of the trade with each country again demonstrates the great preponderance of British interests in the east. The commerce of Japan with her neighbor is on the increase, having risen from *HK. tls.* 4,145,434 in 1872, to 5,649,663 in 1879. The total value of the import of opium in the latter year is stated at more than thirty-six and a half million taels: the quantity at 83,050 piculs; but in one of the recent British Consular trade reports from China we remember to have seen the estimate that, the amount taken cognizance of by the customs department, is probably only about seventy per cent. of the total introduced. Cotton goods were imported to the value of *HK. tls.* 22,599,679: woollens, 4,954,472: miscellaneous piece goods, 124,359: metals, 4,132,067: sundries 13,880,230; making a grand total of \$82,227,424, the opium import being to the balance in the proportion of about 2 to 3. The export of native merchandise to foreign countries, tea and silk being, of course, the principal constituents, was equivalent to *HK. tls.* 72,281,262.

THE *Presse* of Vienna, quoted by the *Shanghai Courier*, has a curious article on nihilism and socialism in China. The one was naturally succeeded by the other, its close relation. Indeed some scheme of reconstruction, however crude and selfish, must always take the place of one of sheer destruction. The German writer says that nihilist doctrines first made their appearance in China in the tenth century, when Buddhism began to take the place of the old national religion based on the worship of the forces of nature. The doctrine of the Nirvana, the extinction of the individual, was taken in its material sense, and the state, society, and the family were represented as only deserving of destruction. A succession of bad harvests, which caused a general famine, inclined the masses of the people to support the nihilist tendency to pull down all existing institutions; and the consequence was a series of civil wars which put an end to no fewer than six dynasties in a single century. The reign of terror, anarchy and chaos thus produced was supplanted, about 1050 A.D., by that of socialism, under Wang-ngan-tche, a leader immeasurably superior, we are told, to Proudhon, Lassalle, Bakounin, or Karl Marx. "He thought he would be able to construct on the social basis which nihilism had levelled, a new organization of humanity. He was born in 1027; and even the most hostile of his biographers praise his learning, intelligence, and eloquence. The ability and success with which he confuted the arguments of the nihilists made him popular; and Emperor Tcheutsung invited him to his Court and made him his chief Minister. In 1069 this Chinese socialist was the most powerful man in the empire next to the Emperor himself. He first issued a decree abolishing all personal property in land; the whole country was to be cultivated by the State and its produce equally divided among the people. Other decrees placed all private industries under State management and made them State property, and compelled all capitalists to pay to the State a fifth of their capital every year for five years. Thus the State became the sole possessor of property, both in land and in money, and the only employer of labour; there were neither rich nor poor in the country, and each man derived his only means of subsistence from the State." The inevitable result followed, as it must always come from the practical application of any communistic theories until mankind is so constituted that its individual members are equally intelligent, industrious and thrifty. The complicated machinery of government soon "gave rise to many abuses; the State proved, as might have been expected, incapable of discharging the gigantic task which had been imposed upon it, and unprincipled persons took advantage of its difficulties to enrich themselves by speculation. Sse-ma-Kuang—one of the most eminent of Chinese statesmen and poets—got up a powerful opposition to the socialist Minister, who, however, maintained his system for fifteen years. At the end of that period the Emperor died, and his widow, who was appointed Regent, recalled Sse-ma-Kung to the post of Prime Minister, which he had been obliged to vacate on the appointment of Wang-ngan-tche. This was the end both of socialism and of nihilism in China." With the exception of France the Celestial Empire is probably the only country which has endeavored to employ either system in its forms of government.

FOLLOWING in the wake of Japan and China, Siam is anxious for a re-adjustment of the conventions which control her intercourse with foreign nations. We read in the *Siam Weekly Advertiser* that one object of the projected trip of the Siamese foreign minister to Europe is to endeavour to effect a revision of the treaties that now exist between Siam and the Great Western powers. "It has not yet transpired what particular parts of those treaties the Siamese wish modified. Asiatic powers cannot reasonably expect Christian

nations to grant them the benefits of international law, till they themselves honestly fulfil all the requirements of international law. Asiatic nations must first possess social, domestic, and political principles of morality that harmonize with those of Christian nations, or there will be no reliable basis for their admission into the brother-hood of Christian and civilized nations. Incompatible and antagonistic elements can never combine."

THE proposal of Commander Cheyne to reach the North Pole by means of balloons was unfavourable pronounced upon by the Royal Society. Now, however, it is again prominently before the English public. We notice that the gallant Commander has written a rather enigmatical letter to the *Times* on the subject of his Arctic ballooning scheme. Some time since a Fellow of the Royal Society challenged him to test the soundness of his views by starting from the Crystal Palace, making an aerial voyage to Edinburgh, and returning to the Palace in a balloon. Our readers will probably remember that Commander Cheyne claims that by his system balloons can be guided and controlled so as to reach the North Pole and return to open water, floating at a safe distance above the impassable Palæocrystic Sea. The very essence of the scheme being the practicability of guiding the balloons his challenger called upon him to reach one fixed point from another in England, and so let the whole world be at once convinced of the feasibility of the plan. The manager of the Crystal Palace also offered his hearty co-operation in carrying out the trial, and no doubt a large number of people would pay for admission to the Palace to see Commander Cheyne start; while, as the "F. R. S." slyly hints, "a still greater multitude would assemble to witness his safe return." Commander Cheyne was thus forced either to accept the proposal or give his reasons for declining it, and he accordingly wrote the letter we have referred to in the *Times*. He begins by showing that the conditions under which a balloon journey must be made from London to Edinburgh are by no means identical with those which would be encountered in the Arctic regions. On each side of the line of advance in England is a dangerous sea, while the imaginary voyagers to the Pole could at the worst only fall into one of the narrow channels through the ice and would be able to get at once on to solid holding ground. Moreover, the essence of the Commander's device is, that the balloon should be controlled by tail ropes dragging along the ground. But then, as he appositely points out as an argument probably against accepting the challenge, imagine the consequences of such an arrangement when the balloon was driving over a thickly populated town! The start from the Palace, even if it could take place in view of such objections, would have to be made on a day fixed long beforehand and freely advertised. And what if when the day came and the people were all assembled and the balloons all ready inflated, the wind were to blow obstinately in the other direction? In the Arctic regions the Commander would, of course, carefully choose his day, after exact observations beforehand. This all seems, under the circumstances, fair and reasonable enough, and we fully expected to see the letter end by declining the proposal. But not so. Commander Cheyne adds:—"We are, Sir, ready to co-operate with Crystal Palace Directors in testing a balloon trip, provided we do not use our subscribers," [lives or money?] "and provided the conditions of the trip are reasonable and thoroughly understood by all." This all looks extremely like as if the gallant Commander was endeavoring to run with the hare and hunt with the hounds: he first attempts to shew the impracticability of the proposal made to him and at the same time pretends to accept it.

ACCORDING to the report of the Evangelical Alliance of Japan for the year 1879, the roll of the association has been increased by the election of twenty-eight new members, the whole number being ninety-one at the end of the year. As the name implies, the organization is strictly a Protestant one, and hence the numbers and work of the Roman Catholic and Russo-Greek missionaries find no place in the lists. A statistical table of the Protestant Missions in Japan, for the year 1879, shows that there are one hundred and seventeen male and female missionaries, representing sixteen evangelizing corporations. There are in the empire thirty-six stations where missionaries reside, and seventy-six out-stations. An increase of 1,084 is recorded in the baptisms of adult converts since July 1878, the total number baptized last year being 2,701. Of children, 265 were subjected to the rite. The Edinburgh Medical Mission and the United Presbyterian Church of Scotland have each a hospital and a dispensary attached to their establishments. In these and in the three dispensaries of the American Board of Commissioners for Foreign Missions, 280 in-patients, and 13,286 other patients, exclusive of those relieved during missionary tours, received treatment; and twenty-six Japanese medical students are following a course of instruction. At a meeting held in May, last year, a Committee was appointed for the purpose of securing and preserving such books bearing upon the progress of Christianity in Japan as may from time to time be obtainable. The list of those already procured is, at present, but a meagre one; and so, "if the friends of the Alliance will kindly add to the number of these volumes any others which may serve to illustrate the progress of Christianity in Japan, or its past and present religious history, they will receive the cordial thanks of the members."

WE read in the horticultural columns of a San Francisco paper that Japanese fruits and flowers are gaining favour on the Pacific coast. Of chestnuts imported from this country it is said that they were so much larger, and consequently so much fewer to the pound than was expected, that the supply was soon exhausted. Orders were, however, sent to Japan for fresh consignments which would arrive in ample time for planting. The writer becomes ecstatic when he has to treat of the Japanese lily. He says "The gold-banded lily (*Lilium Auratum*) is a native of Japan, where it is grown in immense beds by the people. Its bulbs are used in cooking; its flower in decoration; the plant appears in various forms in Japanese drawings and paintings:—in short, it is a favorite with the natives, and occupies the leading place among the lilies of Japan. Indeed, it may be doubted whether any other known lily has attracted so much attention or become so popular among flower-lovers. If ever a flower deserved the title of 'glorious' it is this, whether we regard its size, sweetness, or exquisite arrangement of color. The flower is from eight to twelve inches across, composed of six delicate, white ivory-like petals, each being thickly studded with chocolate crimson spots, and having a bright golden band through the center of each petal. In ordinary garden soil we have produced thirty-five flowers on one stem. When first introduced into England, this lily excited a *furore* quite indelible. Magnificent specimens were soon shown, and the *Auratum* earned the title of *Queen of the Lilies*, whose flower spikes, which held from fifty to one hundred and fifty flowers, were often exhibited. The moist, cool climate of England brings them to a degree of perfection unsurpassed elsewhere. A bed of fine *Auratum* lilies in full bloom, with their beautifully mottled bells of white and gold, is a sight to remember."

THE following circular has been addressed by Mr. J. T. Griffin to the members of the choir of Christ

Church. Mr. Griffin's vacation of his office will be subject of regret to choir and congregation alike.—

"I cannot finally leave the post which I have so long occupied, without tendering to each member of the choir, individually, my best thanks for their valuable co-operation in the service of the Church, during the long time that the musical portions of that service have been under my control. It is well known that, during the incumbency of the Rev. Mr. Garratt, our choral music was raised from a state of chaos to one of such perfection, as became the emulation (if not the envy) of other foreign communities in China and Japan. This splendid result was achieved by the grand spirit of unanimity which always pervaded our work together: allow me to hope that under the new régime this *esprit de corps* will be in no wise diminished, but that the music will be performed with even greater success than hitherto. Thanking you personally for the great kindness and attention which I have invariably received during my term as organist, I am &c."

OUR attention has been called to a printer's error in the article on "Mr. Edison's new departure" published in this review on the 8th instant. "Thirty" appears instead of "three" in connection with the magnifying power of microscopes, and, although the mistake is self-evident, it seems in some unaccountable manner to have led to misconception in one quarter at least. Recent influential American journals confirm the tenor of our articles on the subject of Mr. Edison's pretensions.

WE have received from Dr. Geerts a communication on Sanitary Reform on Japan. Its length compels us to defer publication of it until next week.

#### MUSEUMS AND EXHIBITIONS IN JAPAN.

##### III.—KAITAKU HAHABUTSEKAN.

AMONG the various exhibitions of interest in the capital may be noticed that belonging to the Kaitakushi or the Department of Colonization, situated near to the entrance of the temple grounds at Shiba. Here are to be seen the natural and industrial products from the Island of Yezo and more northern islands. The small garden which surrounds the Museum buildings is chiefly interesting on account of the number of foreign fruit trees and plants with which it abounds. These are mostly American, there being many fine specimens of American apple trees and roses, such as the Department have introduced from that country into their large cultivated districts round Sapporo. Such work, including the rearing of cattle and the formation of farming and agricultural establishments in Yezo, form a large proportion of the undertakings of the Kaitakushi. Several fine specimens of the redoubtable bear of the island, some of enormous size, may be seen caged in a part of the surrounding grounds.

On first entering the Exhibition one's attention is arrested by a display of utensils and clothing such as are employed by the aborigines or Ainos. These pieces of clothing and the other domestic articles differ as entirely from their equivalents among the Japanese as the physiognomy of this curious people differs from that of their southern conquerors and rulers. The story of how, little by little, the Ainos have been exterminated and driven northwards by the Japanese, takes up many a page of the early history of the country: finding a striking parallel in the fate of the early Britons. This is not the place to enter into the various theories which have been broached as to the origin of the two distinct peoples which now inhabit different islands of Dai Nippon.

The curious garments referred to consist of large tunics with tight sleeves; trousers and gaiters, resembling altogether the general style of clothing used by the Laplanders and other inhabitants of arctic regions, and differing absolutely from anything to be found among the Japanese themselves. The dress of the women is similar to that of the men. These articles of attire are for the most part of the most primitive kind, being composed of bear skin or smaller furs sewn together in a rude manner. The edgings are, however, ornamented with coarse woven material having curious

primitive patterns woven in crude colours upon them. Some of the garments are of leather without fur, or simply of fish skin; and a curious example of a leather coat, thickly covered with large feathers sewn on to the surface, is also to be seen. Such articles of adornment as large ear-rings and necklaces, never employed by the Japanese, may moreover be noticed. This habit of piercing the ears which has been retained to the present time in Europe, and is considered as one of the most attractive of woman's adorning little arts; has, it appears, been regarded by the Japanese as a barbarity and with equal abhorrence to that with which we are accustomed to consider similar practices exercised upon the nostrils. The necklace, too, curiously enough, seems never to have been employed by the Japanese, no examples of its use being discoverable even in old books or drawings. Among the collection of Aino implements may be noticed a large native canoe for otter-hunting purposes; made of dried skin, having the deck entirely covered in with the same material, leaving only three holes to form seats for the crew. The sport of these native hunters has of late years been much reduced by the more active and better equipped expeditions of a few enterprising Europeans. Sailing towards the North in their cutters as the summer months draw near, furnished with light boats and rifles, they have year by year considerably lessened the live stock in the most navigable of these waters.

Specimens of the skins of these rare sea otters as well as stuffed specimens of the animals themselves may be seen arranged in other parts of the museum, some furs having the handsome silver tipping which renders them so valuable. Models of the ordinary dwellings of the Ainos are also exhibited. These huts are most primitive in their construction and are raised for the most part some six or eight feet from the ground upon upright posts, probably for the purpose of protection from the much dreaded wild beasts, or to raise the floor of the dwelling above the general snow level in the colder months. The entrance is reached by a short ladder. The products of Aino manufacture appear to be very simple and unimportant, consisting chiefly of baskets and other receptacles made in grasswork and some rude examples of plastic ware. A considerable array of zoological objects will give the visitor a complete acquaintance with the mammalia, birds and fishes of the northern islands of Japan. Among them may be noticed a walrus of enormous size, and several deer and foxes from the Kuriles. In most cases, moreover, the specimens appear to be tolerably well set up, a remark which cannot be said to apply to all similar collections in other Japanese museums. There are also paintings of the most important birds, taken, we understand, from the extensive collection made by captain Blakiston. This gentleman, well known for his long residence in Yezo, has given special attention to the feathered tribe and obtained as a result of long and patient trouble a very valuable collection of Japanese birds. The museum also contains many good cases of these birds, also fish, shells, and butterflies peculiar to these parts.

The Department of Botany is represented by a large display of woods, seeds and other botanical objects, the commoner and large woods being in many cases, as would be expected, entirely different from those employed for building purposes further south. Examples of furniture, such as chairs, tables, and cabinets made by the Department from these woods at Sapporo are to be seen, the great objection to them being chiefly their great weight compared with articles made from the southern woods.

Upon the walls of the Geological division are to be noticed the results of the elaborate survey undertaken for the Kaitakushi by Mr. B. S. Lyman, formerly Geologist to the Kobusho. These are in the form of large maps, very carefully executed, representing much labour and time spent in investigating the mineral wealth of Yezo.

Those who wish further insight into the particulars of this work, will do well to peruse the several voluminous and most sanguine reports published by Mr. Lyman for the information of the Colonial Minister. Near these maps are cases of specimens of most of the minerals.

The Kaitakushi Department has attempted in this exhibition not merely to put before the people the natural and native productions of the so-called colonies, but also to shew some of the results of work undertaken by themselves in improving the wilder nature of the country, and in starting in the midst of the the inhabitants new manufactures and industries. What strikes one most is the variety of different experimental

introductions in the way of manufactures which they have attempted. One of the most curious is the making of the Sapporo beer as it is called, which has in many cases obtained great success, but which, however, is not lasting on account of continual changes in the brand. It is common to find one case of Sapporo beer all that could be desired, and the following one perfectly undrinkable, shewing that no regular system is followed in its manufacture.

Tinned salmon and venison, modern agricultural implements, as well as models of modern engineering, land and river works, are to be noticed among these novel introductions of colonization. There are also many specimens of silk produced in Yezo, and examples of silk-weaving executed at the spinning establishment at Sapporo.

We have omitted to mention a map to be seen near the entrance to the exhibition, which is interesting as representing the only trigonometrical survey of any extent undertaken in Japan. Upon the carrying out of this survey a large foreign staff was employed and a vast sum of money expended.

The Department of the Kaitakushi has received, from time to time, more criticism and censure than any other division of the government. Accusations of mismanagement and waste have been mercilessly levelled at it. Those interested in the work actually carried out by the Department in its difficult duties, will be able to see on visiting this museum many of its most creditable results.

#### CORRESPONDENCE.

(Our readers must distinctly understand that we are in no sense responsible for the sentiments or opinions of our correspondents, for the accuracy of their assertions or for the deductions they may choose to draw therefrom.)

[We reproduce, from the columns of the *Japan Daily Mail*, the following correspondence on the subject of the management of the Temperance Hall.]

#### THE TEMPERANCE HALL MANAGEMENT.

To the Editor *Japan Daily Mail*.

SIR,—Your issue of Monday contained a paragraph with some remarks on a case which had been part heard in the British Court on Saturday,—“Mizzi c. Ridderbjelke, Manager of the Temperance Hall and Seamen's Home.”

Without doubt in publishing that paragraph you have been actuated by the best of motives, and your public spirit is worthy of commendation, but it is matter for surprise as well as for regret, that you should not have made some inquiry before exalting complainant into a hero, and condemning the complained of as an extortioner. It is true that you have since stated that the latter has been completely exonerated, and in a somewhat involved paragraph, have further sought to account for your onslaught of Monday. It is for the injured man to say whether the retraction is equivalent to the offence, but I would take leave to express my opinion that the complainant Mizzi, at least, dealt more justly and generously with Mr. Ridderbjelke, when he recognized the mistake he had made.

Something more explicit is, however, perhaps due to the friends and supporters of the Seamen's Home, and with this object I now offer the following account—as briefly stated as possible—of what I have ascertained.

When, on Saturday last, the proceedings in this case in Court, were explained to me, I at once proposed to see complainant righted, if it should prove that there was any truth in his statement, and if in any sense it could be held that the Seamen's Home was responsible for any overcharge that might have been made him. He was accordingly sent to me on Monday morning:—with the result that the charge he had made against the Manager quickly fell to pieces, and subsequently in the afternoon, in my presence, at the Seamen's Home, he showed a good spirit by begging Mr. Ridderbjelke's pardon for having given him all the trouble he had.

Let me point out that, as per newspaper report, there is a hitch in complainant's evidence, which to any one used to sailors' tales, is sufficient to suggest a suspicion of its correctness. He gave a list of items with which he had been charged, amounting to \$25, and stated that he had received in cash, a balance of \$15. Now this makes in all \$40, whereas all the money he ever had due to him was \$37.80.

He stated then something as follows:—I do not of course vouch for the truth of all of it.

“I came here as cook of *G. Broughton* (arrived March last). I got 14 days imprisonment for refusing work and breaking my leave. The British Consul (after expiration of term of imprisonment) was going to send me to Hongkong, but a man named “Frank,” whom I understood to be runner for the Temperance Hall, offered me a berth on the *Fletcher*. To enable me to take this berth instead of being sent to Hongkong, the Manager of the Temperance Hall gave the British Consul a guarantee for me.

“I had \$17.80 due me from *G. Broughton*. This had been deposited at the British Consulate. When the guarantee was given in at the Consulate, Mr. White told the runner that he would hand the \$17.80 into the charge of the Temperance Hall, and that he would get it for that purpose when he went home. The runner afterwards told me that he had received this \$17.80 from Mr. White.

“When I signed articles for *Fletcher*, I received £4 advance note. I went to the Temperance Hall with it, but the manager was out. I met the runner in the street, and gave it to him.

“Next morning I came ashore again, and went to the Temperance Hall.”

Then he repeated his statement to the effect that he had been paid \$15 in cash, and been charged \$25 for various things. On further questioning he admitted that of this the charges made by the manager only came to \$9. (To wit \$5 usual guarantee fee, \$2 for two days and part of a third day's board, and \$2 paid as fees to Duclos (the runner), for shipping him:—all which is quite regular.)

His own shewing, therefore, confirms the assurances of the manager, that neither balance of his wages, nor the advance note, ever came into the hands of the manager. Duclos, who is not a servant of the Home, but who has been from time to time employed in shipping men off for the Home, paid the manager the bill of \$7, out of the funds of Mizzi which he held, and took his own fees of \$2 himself.

And Mizzi now made a further admission which broke down his case completely, viz:—that at Livingstone's the runner had paid him \$10 cash: and this admission he subsequently repeated at the British Consulate.

I pointed out to him that this was at complete variance with his complaint in Court, that it accounted for \$34 out of \$37.80, whereas he had sued for \$14 (or \$15.)

He sought to explain this by saying that this other \$10 was a bonus for his having put some cook into his place: (an explanation, however, which places him on the horns of a dilemma.)

That he, poor fellow, got relieved of a good deal of his money before he finally went on board, is too probable from what little he told me of his doings ashore, “standing treat,” &c.; but the saddle must be placed on the right horse.

It is a sad reflection that many of our merchant sailors who come ashore for a day or two in Yokohama, lose in those few hours the earnings of months, and are beside degraded below the level of men. The Seamen's Home has been striving hard to do something to protect these men, and save them from such perils, but its efforts are rendered wellnigh futile by the influences which are arrayed against it. Not the least of these is the power possessed by the two or three men who, under the name of runners, provide seamen for ships, and without whom it is virtually impossible to ship off men.

In Shanghai, I believe, all the shipping of seamen is done from one office in connection with the Sailor's Home, under the auspices of the various Consuls. Some of our Consuls have endeavored to establish a similar system here, and failing success in that direction, have done the next best thing they could in as far as possible giving the preference to the Seamen's Home, but as long as the runners are in the field, drink and gullibility are too powerful.

If this case should prove the means of awakening more interest, among any of our residents, in the welfare of these men who visit our shores, I, for one, shall not regret its occurrence.

I am, Sir,

Yours obediently,

A. J. WILKIN.

Yokohama, May 19th, 1880.

To the Editor of the *Japan Daily Mail*.

SIR,—Mr. Wilkin's letter in your columns to-day makes very apparent what has long been strongly suspected, viz:—that

more publicity with respect to the system of management, &c., of the Seamen's Home, is very desirable in the interests of the institution itself, the subscribers, and the class intended to be immediately benefited.

Sometime since the ruling powers of the Home were called upon through the columns of your contemporary the *Gazette*, to publish a statement of accounts. I am not aware that this has yet been done. No doubt good reasons exist why the accounts should not be published, but the supporters of the institution at any rate, are entitled to know the causes which have induced the Committee, or whoever is the responsible person or persons, to adopt so serious a departure from the ordinary rule.

"Anyone used to sailors' tales," to quote Mr. Wilkin, will not be inclined, under the circumstances, to place much credence upon the story of Mizzi as related to that gentleman, more particularly when it is borne in mind that, in order to give his Monday utterances any value, the fact of his having made a deliberate misstatement on oath on the previous Saturday, must first be conceded. However, enough of this; and, with your permission I will now ask a few questions which, in common with several other subscribers to the Seamen's Home, I would like to see answered.

1st.—Is whoever may be the manager for the time being of the Home, responsible for the working of the establishment and therefore for the acts of his subordinates?

2nd.—If the runners are not on the staff of the Home and are as undesirable people as Mr. Wilkin hints, why are they permitted to receive, on behalf of the establishment, seamen's wages? (See Mr. White's sworn testimony.)

3rd.—Does the charge of \$5 exacted for guarantee go towards the funds of the Home, and will it continue to do so under the new arrangement?

4th.—Was the defendant in the recent case aware when he guaranteed the plaintiff at the British Consulate, that the runner for the Home had already a berth open for the plaintiff's acceptance?

5th.—If the manager of the Home knew nothing about the charges made by the runner, how did he arrive at the balance of \$5 which he handed over to Mizzi?

6th.—Who was the benevolent gentleman that charged \$6 for cashing the advance note for £4? Has it at anytime been the practice of any of the managers of the Seamen's Home to cash advance notes; and, if so, has this been done with the sanction of the Committee?

7th.—What is the present arrangement respecting the Home; and have the supporters of the institution been consulted before so wide a departure—to judge from a notice in the *Gazette*—has been made from the original objects of an establishment to which the public has so liberally subscribed?

Satisfactory explanations on these points should be easily afforded, and would, I feel convinced, do much to restore public confidence in the Seamen's Home, and, with restored confidence, it ought to be no difficult matter to secure the future of the institution through the joint action of the American and British Consular authorities, since at least nineteen-twentieths of the sailors visiting the port, are amenable to the laws of either one or the other of those nations.

A SUBSCRIBER.

Yokohama, 21st May, 1880.

To the Editor of the *Japan Weekly Mail*.

DEAR SIR,—In a letter which is published in last week's *Mail*, Dr. Wagener of Kioto asks you to tell him "through what published document or public lecture Mr. Ewing can authenticate his claim of invention" of the pendulum method in seismometry. As I have never made any such claim I am of course unable to help you in finding the references Dr. Wagener asks for. At a recent meeting of the Seismological Society I exhibited and described an earthquake recorder which makes use of the pendulum principle, but I was then careful to explain that the principle itself was by no means new. I spoke of it as "the well-known principle that the bob of a long pendulum may be assumed to be sensibly stationary during most shocks," and again I said that this method was "widely trusted by seismologists." If Dr. Wagener will turn to the *Japan Gazette*

for May 1st, 1880, he will find these words. In fact, as regards that seismograph, I did not formulate any "claim" at all (although in your short report of the meeting I am credited with having done so)—I simply described the instrument, leaving it to tell its own tale to people who know about those things. I might, with justice I believe, have "claimed" that it was new in all respects except one,—except in its being an application of the pendulum method, which, as I said, was old. I do not see how there can be any question of priority between two observers of to-day with respect to an invention which Mr. Robert Mallet, writing in 1858, describes as "the oldest, probably, of seismometers."

Yours very truly,

J. A. EWING.

#### NOTES OF THE WEEK.

##### BIRTH.

At No. 7, Kaga Yashiki, Tokio, on May 20th, the wife of Professor J. A. EWING, of a daughter.

##### MARRIED.

On 11th May, at the Cathedral, Shanghai, by the Very Rev. Dean Butcher, EDWIN NOBLE, of Rochdale, Lancashire, to ANNIE MEADE, of Westbury, Wilts. No cards.

On Tuesday last the M. M. steamer *Volga* arrived in port from Hongkong, with the home mails to April 2nd. The P. & O. steamer *Sunda* left for Hongkong on the 20th, and the *Oceanic* is advertised to leave for San Francisco, at nine o'clock, to-morrow morning.

The *British Medical Journal* warns people against excess in tea-drinking, and cites the case of two members of the Chinese Legation in London who have recently suffered from hæmatemesis to an extent that might well alarm an English physician. "Their condition, however, caused no anxiety among their compatriots, who stated that vomiting of blood is exceedingly common in China, and is rarely fatal, causing only discomfort and weakness for a time. Vulgar current opinion on a medical question is not of much value, but the statement as to the prevalence of hæmatemesis in China comes from cultivated Chinamen, who are not only repeating a rumour, but giving the results of their own observations. Their view is, that this gastric hæmorrhage is to be attributed to the habit of a large number of their countrymen of eating largely at wide intervals, and distending the stomach with fluids, so producing hyperæmic erosion of its walls and eruption of vessels; and also to the

effects of tea-drinking on the nutrition of the walls of the vessels in persons who are living poorly and obtaining very insufficient supplies of fresh meat and vegetables. It occurs most frequently in debilitated and cachectic persons; but they do not think that it is specially connected with diseases of the liver, lungs, pleura, or heart, and are of course unable to say whether gastric ulcers exist in association with it. It comes on generally after a meal, with a sense of fulness, cardialgia, and nausea; and the quantity of blood vomited is often very large. The Chinese distinguish clearly between hæmatemesis and hæmoptysis, and regard the latter with great apprehension, the former with indifference. *The observation as to the part played by tea-drinking in the production of hæmatemesis in China is interesting in connection with Dr. Budd's conclusion that ulcer of the stomach is most frequent in this country in wait-servants, who certainly constitute one of our great tea-drinking classes.* English medical men practising in China, of whom there are now a considerable number, might furnish valuable information on the subject of hæmatemesis in China."

Owing to a number of adverse circumstances the reception of Professor Nordenskjöld and the members of his expedition remaining in the *Vega* on the occasion of her arrival in England, was not so brilliant as had been intended. It is remarked that, "had the *Vega* arrived two days earlier at the Tchutkehi Peninsula she would have made the North-East Passage—which has baffled some of the most eminent explorers for the last three hundred years—in one season, and would have escaped ten months imprisonment in the ice. Had she arrived two days earlier at Portsmouth the gallant Swedes would have met with a reception that would have shown how highly Englishmen appreciate the patience, forethought, and thorough scientific knowledge, without which a task of such magnitude could not have been accomplished. . . . Watchers were stationed along the south coast of England. The *Fire Queen*, with Sir George Nares, a distinguished party of Arctic officers, and deputations from the Swedish Legation and Royal Geographical Society on board, lay night after night at Spithead with steam up, ready to proceed at a moment's notice; a banquet at which the Prince of Wales was to have presided was waiting in London; and various fêtes and entertainments were postponed from day to day. As the Easter holidays drew near, however, it became evident that a public reception was out of the question, and the departure of the Queen for the Continent precluded the possibility of her receiving the explorers. Professor Nordenskjöld and Lieutenant Palander arrived at Paddington on the evening of the 26th ultimo, Good Friday, and were entertained on the 27th by Mr. Clements Markham, C.B., the disappointed party from the *Fire Queen* being invited to meet them." The gallant explorer, however, was probably better pleased with the opportunity which was afforded him of passing a few quiet days at English country houses, than he could have been by a succession of civic demonstrations and repasts.

The case of the man Ross, convicted before the United States Consular General Court of murder on board the American ship *Bullion*, has aroused diplomatic discussion on the question of jurisdiction. The cabinet in London and Washington will, apparently, have some correspondence, before the fate of the assailant is finally decided.

A writer in a contemporary compliments Japanese upon the extraordinary skill shewn in their attempts at English composition. To judge from the following circular now in course of distribution, their efforts are not invariably successful:—

"Foreigner's Servant Conductor.

"The undersigned Company have to introduce and undertake into Foreigner's houses with Japanese Servants (boy and maid) by the requirement of both party. Mr. Watanabe Seikichi has been dismissed from the Company and Mr. Furushio Bunzaburo is to continue his charge as agent."

It was a source of immense gratification to the public to learn on Monday afternoon that the *Suminoye Maru*, which was in the morning reported to have been lost on the Rattler Reef in Tangarai Straits, had arrived safe and sound at Hakodate in the course of the day. We mentioned the rumour of disaster in our morning issue, the source from which it was conveyed to us being, we thought, only too reliable. We need not say

how pleased we were to be able to issue an extra denying the rumour, to which currency had been given by the morning supplement of the *Japan Gazette*, as well as in our own columns. We have reason to believe that some casualty has occurred at the spot indicated, and that it has been magnified into the other disaster of infinitely greater extent.

The annual meeting of the Tir Suisse held on Friday and Saturday last was a great success. Among the visitors were Admiral Kawamura, General Saigo and General Oyama, who appeared much interested in the proceedings and fired a few shots at the target. The following are the names of the winners:—

#### CIBLE PATRIE.

1st prize .....	Col. Murata
2nd " .....	Mr. Beretta
3rd " .....	" Henn
4th " .....	" Trueb
5th " .....	" Favre-Brandt
6th " .....	" Grunwald
7th " .....	" Feyerabend
8th " .....	" Biagioni
9th " .....	" Pardun
10th " .....	" Tanimoto

#### CIBLES À POINTS.

1st prize—Mr. Beretta.....	Points, 61
2nd " Col. Murata.....	60
3rd " Mr. Suyekawa.....	54
4th " " Tanimoto.....	48
5th " Admiral Kawamura.....	47
6th " Mr. Giusani.....	46
7th " " Favre-Brandt.....	46
8th " " H. Abegg.....	41
9th " " A. H. Dare.....	39
10th " " Schoene.....	37

#### CIBLES TOURNANTES.

1st prize—Mr. Beretta.....	Points, 291
2nd " Col. Murata.....	242
3rd " Mr. Favre-Brandt.....	229
4th " " Suyekawa.....	140
5th " " Schinne.....	78
6th " " Giusani.....	76
7th " " Tanimoto.....	66
8th " " Mottu.....	40
9th " Admiral Kawamura.....	38
10th " Mr. Deck.....	36
Special prize for non- members ) Mr. Kawamura.....	103

A ludicrous but easily accounted for error was made in the telegraphic messages respecting the ransom demanded by the bandit Nikko for Colonel Syuge. The amount was 15,000 *liras* not *pounds* sterling and the sum actually paid was 12,000 *liras*, nearly £1,100 sterling.

Mr. Wagner gave his customary evening concert in the Gaiety Theatre on Tuesday, when in spite of the reduction in price of admission the audience, though numerous, did not fill the house. The programme was admirably varied and some portions of it seemed to give great pleasure—all the vocalists being encoored. The concert opened with an arrangement for quatuor of Mozart's Overture to *Die Zauberflöte*, followed by a pathetic Scotch song "The Flowers of the Forest." This brought out an old favorite of the public (Mr. Black) who was well received as of yore. Next a flute solo "Souvenirs de Mario" played by Mr. Wagner as only he can; an enthusiastic recall brought back the performer who bowed his thanks. The charming sympathetic voice of M. Falque was next heard in Bordese's "Faust," and this time the audience would not be denied the pleasure of hearing the singer again. We must congratulate M. Falque upon the great improvement evident in his style since he first appeared a year or so ago, and hope that he will not rest until his really fine voice be brought into thorough artistic subjection. The first part closed with Hummel's fine Trio in F. flat, Op. 12, well played by Messrs. Keil, Wagner and Crane: the beautiful slow movement with its wretched melodies, "in linked sweetness long drawn out," and the short fiery *Presto*, especially pleasing to the house. The second part opened with a *Poissarri* for quatuor upon Donizetti's "Belisario," one of his earlier operas. Next Mr. Andersen with Schumann's "Wanderlied" roused the enthusiasm of his compatriots. The *beneficiare* played a violin solo by Singele which was loudly re-demanded, but as on the former occasion, Mr. Wagner modestly declined the encore. Mr.

Black followed with more provincial songs (intermingled with a speech or two) and the whole came to an end shortly after eleven o'clock with a second solo for the Flute, on airs from Meyerbeer.

We learn that the Amateur Dramatic Corps is going to give a final performance at an early date. The play selected in the *Ticket of Leave Man*, played here some years back with Mr. Townley in the title rôle and Mr. Jaquemot as the heroine.

We dwellers in the Extreme East have often been the object of some pity from our grander neighbours in the flowery land of China, because of the real or fancied "slowness" of our life here. True we have not the busy mart, the huge emporium, or reflected splendour of a Government House, like our cousins in Hongkong; neither can we boast the palatial residences and colossal gaieties of that "Queen of the East"—Shanghai. Yet we have some mitigations of our hard lot—our climate with its sunny sky not unworthy of comparison with that of Italy which the aforesaid consins thoroughly appreciate in their flying visits or transient sojourn—and not the least of these our compensatory blessings is the presence near us in Tokio of members of the various learned professions employed in the Government University and schools there, and who from time to time give us some account of the progress of science in her triumphal march. We do not mean to assert that these our learned neighbours are the peers of Faraday, Huxley or Tyndall, but in the main they are honest and true men who will not fail to expound faithfully to us the inventions and researches made by such apostles of the truth as those just mentioned. We have often been tempted to envy our Tokio friends who live so much nearer to the rose than we: but now that the Christian Association has prevailed upon Professor Mendenhall to lead the way, we hope that many of his brother professors will follow and kindly keep us—exiles from the light as we are—*au courant* with the course of affairs in the great scientific world. And these things are, or should be, of interest to every man. It matters not whether we agree in things political or in things religious: the fact remains that whether a man be Christian or Deist, Moslem or Atheist, he is bound to learn as much as he can of the physical world around him. And still more is this duty binding upon us when these things are popularized and placed before us in attractive form, as they were last evening. After these premises we need only mention the fact that some *forty* (!) people assembled at No. 39 to greet the learned professor, and our moral is pointed without further words. There should at least have been ten times the number; and we think that, had the community any idea of the treat they were neglecting, we should not have thus to complain of seeming apathy. We have not space to give an account of the lecture in detail: suffice it to say that the rudimentary principles of sound were set before us in terms clear, terse and precise. With the aid of illustrations, the generation, birth, and short career through the air of any sound were fully detailed and exemplified to the great delight of each member of the little company. We hope that Professor Mendenhall may be induced at an early date to favor us with a continuation of the interesting subject; that he will not then stop at the tympanum of the ear, but taking us inside explain and display to us the mystery of hearing. The ingenious and complicated mechanism of the human ear—with its drum reversing the action of the musical instrument (the membrane setting in motion the drum sticks in this case); the wonderful system of ear-bones (hammer, anvil and stirrup)—the mysterious labyrinth—the fibres of Corti, so delicately attuned that we can distinguish so small an interval of musical sound as one sixty-fourth part of a tone—all these things are wonders and marvels which we carry about daily in our own bodies, and yet how few of us are there who know anything of the matter. We feel sure that, if Professor Mendenhall continue his course, he will find a large and attentive audience awaiting him on a future occasion.

Our readers will be glad to notice, by the report of the steamer *Guy Mannering*, that the barque *Pym* has been spoken off Cape Idzu. The *Pym* sailed from Antwerp in August last, and fears were entertained for the vessel's safety.

A correspondent writes to the *Straits Times*—The following

extract from *Iron* may prove of interest, though it may not be agreeable to those fond of butter—for what with the local pork fat, and the universal 'oleomargarine,' the pure article can hardly be said to exist, unless home-made under close inspection: "The big thing in adulteration at the present time is, however, 'oleomargarine' a substitute for butter, which, according to a report of the British Consul-General in New York, published the other day in a blue book, is exported from that city at the rate of about 6,000,000 lbs. a year. It is sent chiefly to Holland, there mixed with a certain proportion of milk to give it the proper flavour, colouring ingredients to complete the resemblance to butter, and afterwards churned and converted into 'butterine.' It is then reshipped, packed in butter-tubs, to France and England, chiefly to England, where also, no doubt, a good deal of the French importation ultimately gets, *via* Normandy. The 'oleomargarine' is produced by a very nasty process. The fat of which it mainly consists having been crushed in a solution of common salt and sulphate of soda, it is slowly heated to 103° and at the same time mixed with a quantity of the gastric juice from the stomach of a pig, and the fat drawn off. The stearine is then separated, milk or cream added and the whole carefully cooled. An eminent American analyst asserts that more than 90,000,000 lbs. of oleomargarine butter and cheese were manufactured in the United States in 1878, and that he had found living organisms and eggs resembling those of the tapeworm in it. Dr. Piper, another chemist of repute, enters more into detail. He says:—'I have examined a large number of specimens of oleomargarine and have found in them organic substances in the form of muscular and connective tissues, various fungi, and living organisms which have resisted the action of boiling acetic acid; also eggs resembling those of the tapeworm. I have them preserved to be shown to any one who desires to see them. The French patent under which oleomargarine is made requires the use of the stomachs of pigs or sheep. This is the probable way the eggs get in. I have specimens of lean meat taken from oleomargarine. There can be no question that immense amounts of oleomargarine are sold and used as pure butter. I regard it as a dangerous article and would on no account permit its use in my family.'

Among the items of telegraphic news which has lately been received, was an announcement that Lord Lytton had been created an Earl under the title of "Viscount" Knebworth. It was obvious that beyond the bare statement that Lord Lytton had received a step in the peerage, the telegram was astray, and we have since found the correction in an India paper. Lord Lytton is now Earl Lytton, with the second title of Viscount Knebworth.

We regret to observe in the vernacular papers frequent accounts of suicide, said to have been induced by poverty and trouble, the result of the high prices demanded for the staple articles of diet. In the capital and the provinces self-destruction by steel, cord and drowning is reported to be on the increase.

We read in a London paper that the Russian Government has sent to the Japanese station the *Kia: Pajarski*, one of its best armour-plated frigates, ostensibly for the purpose of continuing the hydrographic survey of the seas along the Japanese coast. The frigate carries an armament of ten 300-pounders, and has the reputation of being a very fast sailer.

A novel sight was presented at the closing scene of the grand review of the English volunteer army on the 29th of March last. A large balloon, with an officer in it, closed the march past. Actually, with three parties holding the ropes by which it was attached to the earth, this balloon swept slowly past the saluting point at a height of about three hundred feet, and saluted His Royal Highness the Duke of Cambridge by descending some distance as it passed.

At the close of last March the national indebtedness of the United States of America stood at \$1,980,092,824. Largely increased revenues, caused by revived business, enabled the Treasury to cancel \$15,000,000 of the debt during the month of March. The rapidity with which the United States is being relieved of the financial burdens occasioned by the rebellion, is not the least remarkable event in the history of that wonderful country.

We notice in the *Times* that an Anglo-German or Germano-Anglian Society has been formed at Berlin, under the presidency of Prince Hohenlohe-Langeburg, with a view of making England better known in Germany and Germany in England, removing national prejudices, and preparing an *entente cordiale* between two nations which have the same blood and have hitherto never crossed swords or bayonets. There is to be, as soon as sufficient sums have been subscribed, an English reading-room at Berlin where travellers may receive information and introductions into German society. We see among the names of the members those of Gneist, von Holendorff, Hoffmann, Panli, Waitz, Joachim, W. Siemens, Van Sybel, Van Treitschke, Von Stockmar, Auerbach, and several Runkens, all names that have a good ring in England as well as in Germany.

The following information furnished by the *Economist* on the subject of the manufacture of brandy in France, will probably account for the appearance of a good deal of the rubbish that is now vended under the name of the spirit so long associated with the names of Hennessy, Martell, Exshaw, &c. Our contemporary says:—"The distillation of alcohol, which is one of the great branches of industry in France, is undergoing a transformation which must eventually compromise the reputation of French brandies in foreign markets. The production of spirits made from wine or wine lees, which is superior in quality to any other, is fast diminishing, and being replaced by inferior alcohol made from corn and potatoes, sugar, beet-root, and other substances. The manufacture of alcohol from grapes depends no doubt on the vintage, and in that respect the year 1879 was an unfavourable one; but apart from that circumstance, the decrease in vinous distillation had already been remarked. The proportion of the production from different sources in 1879, compared with the average of the six preceding years, is shown in the following table:—

From	1879 Hectolitres.	Average 1873 to 1878. Hectolitres.
Corn and potatoes.....	247,171	130,368
Sugar .....	723,631	675,204
Beet-root.....	364,714	318,802
Wine and fruits.....	147,185	390,765
Other substances .....	5,178	24,844
Total .....	1,487,879	1,539,879

The hectolitre being estimated at 22 gallons, the home production in 1879 amounted to 32,733,338 English gallons. The imports, principally from Germany, were 197,313 hectolitres, and the exports, 339,675. Duty was paid on 1,161,129 hectolitres."

A lady on the Duchess of Marlborough's relief committee writes:—"Major Gaskell mentions in his report that he hardly ever saw in Donegal such a thing as bedclothes. People were all lying on heaps of straw, their only covering being some old bags. In Clare, Captain Fletcher, another inspector, says the same, and that any kind of rough material fit for bedcovering would be an enormous boon. Thousands of children all through the country have been kept from school by want of clothes, and are described very much as Zulu children. In the islands the case is still worse, some of the people being described as perfectly naked with the exception of an old rag or shawl about them." It is intended to solicit contributions of clothing for distribution among the unfortunate peasantry.

We read in an English paper that a fire broke out in Montevideo, on the 6th of February last, in Schenzer's extensive German brewery and *bierehaus* in that city. All available supplies of water having been exhausted, and the flames still progressing, the fire brigade asked and received permission of the proprietor to make use of the large stock of beer on the premises in order to continue their operations. The President of the Republic, Colonel Latorre, the Minister of the Interior, and a number of officers assisted at the conflagration, which was not extinguished until it had cost the life of one man by suffocation and more or less severe injuries to many others, in addition to the loss—which some of the reporters appear to have considered the most cruel of all—of some 20,000 gallons of beer cast into the flames.

The St. Petersburg correspondent of *Vanity Fair* writing on the 3rd of April says:—"Lady Dufferin had a narrow escape a

few days ago. The English Ambassador, with the rest of the Embassy, was invited to a bear-hunt in the vicinity of the Russian capital, and Master Bruin, after being turned out of his sleeping-place, suddenly made a dash towards Lady Dufferin, and in a few seconds was alongside her. The affair might have had a fatal ending but for the coolness and decision of Lord Frederick Hamilton, who steadily levelled his rifle at the bear and shot him dead on the spot. The brute fell at the very feet of Lady Dufferin."

We have to acknowledge the receipt from the Inspector-General of the Imperial Chinese Customs, of the reports on the trade at the treaty ports of that empire for the first quarter of the current year.

The Maori Chief Te Whiti, who is causing the Government of New Zealand so much trouble at present, is evidently a most extraordinary personage to judge from the description given of him by the local representative of the *Times*. Writing to that journal on the 30th of last January, the correspondent says:—"The principal leader of the native party is a religious enthusiast and fanatic of the most advanced type, a man of singularly pure and self-denying life, and quite beyond the suspicion or hope of his being reached by any bribe. He is deeply read in the Holy Scriptures, particularly in the prophetic portions, and has brought himself to believe that he is Jesus Christ; that his second advent is at hand; that it is to be accomplished by the crucifixion of himself by the Europeans, after which he will rise again, restore to life all the Maories who have been killed in the wars, drive all the Europeans into the sea, and will then become the King of all New Zealand. Fortunately, so far, all through his career, he has been adverse to the shedding of blood, and declares that if the Government were to take him he would prohibit his people from fighting. At present 200 of his followers are in the colonial prisons in connexion with the ploughing aggressions referred to; he entirely approves their arrest; and the prisoners themselves, as well as their wives and relatives, acquiesce in their detention, being assured by Te Whiti that it has been done by the exercise of his spiritual power and is a step in the progress of his anticipated millennium."

Monday next being the sixty-first anniversary of the birth of Her Majesty the Queen of Great Britain and Ireland, there will be no issue of the *Japan Daily Mail*.

We are glad to notice that the *Mainichi Shinbun* has been released from suspension. The editor states that he could not obtain any definite information from the authorities respecting the cause of their recent action, but that, as it might have been in consequence of the article on Mr. Inouye's mission to China, he has prudently determined not to publish the promised continuation.

#### ASIATIC SOCIETY OF JAPAN.

##### TOKYO MEETING.

A General Meeting of the Asiatic Society was held at the Shōheikuwan, Seidō, Tōkiyō, on Tuesday, May 11th; Dr. Divers, President, in the chair.

Dr. Faulds directed the attention of the members to a unique example of tattooing which had come under his notice. The individual referred to was then brought in for examination, and proved to be tattooed all over in a very elaborate and highly coloured dragon pattern. After telling the man to withdraw, Dr. Faulds said that any persons who desired to make a closer inspection would have an opportunity of doing so at the close of the meeting.

Mr. J. Conder then read his paper entitled "Japanese Costume; Part 1, Court Dress." The author called attention in the first place to the interest attached to the subject of Japanese costume. There was, as had been first pointed out by M. Violet le Duc in his treatise on mediæval dress, an intimate connection between the clothing and the physique of any people, which might be called the physiology of costume. By this was meant certain physical peculiarities in bearing, deportment, and even in proportioning of the figure, suited to each style of attire which was instructively followed by the people of any period of fashion. Those whom nature did not favour in essential points sought the aid of art; and thus we find that

regarded from the distance of several decades, the portrait pictures in our galleries seem to have among themselves a kind family likeness. This family resemblance might be observed, for example, in the books of favourite female beauties of the last half century, which used to furnish the tables of our drawing rooms. This subjugation of physique to the mode of attire has been well understood by the Japanese, and books exist in which all the little arts of adornment, in order to accommodate the features, and the hair, or the regulation of the proportions of the figure by the position of the *obi*, to the accepted styles of elegance, are carefully explained. Admitting all this it was easy to understand the absurdities noticeable among a nation changing their long established costume, or among foreigners in this country when assuming a costume which from want of habit they are unable to wear in other than a ridiculous fashion. It was necessary, then, that the artist, historian, or tragedian, who attempted to depict Japanese incidents, should be familiar both with the particular styles of clothing worn on particular occasions by the different classes and ranks and also with the physical peculiarities wedded to these types.

With the exception of an interesting paper contributed to the German Asiatic Society some time back, nothing had been done to elucidate this subject, and the author now intended to lay the results of his investigations before this Society in which he proposed to consider at length the costume of all classes of the people as it existed before the recent revolutionary changes. On this occasion it was intended to treat only of the costume of the Emperor, Empress, and Court nobles and ladies, reserving for a future time the other divisions of the subject, which would include the costume of the *shizoku*, merchant and farmer classes, as well as military costume and the dress of the religious orders. It would be absolutely necessary that this subject should be illustrated as fully as possible by means of coloured drawings; many of which, already prepared were exhibited to the members of the society.

Mr. Conder continued to enumerate and describe in detail the principal robes worn upon official, semi-official and private occasions. The distinctions in attire, it appears, were strictly fixed according to rank and official title, to explain which a list of the different ranks and offices of the court were laid before the society. An example of the extreme punctiliousness bestowed upon the minutiae of dress might be observed in the different modes of curling and tying the ribbon or *yei* worn at the back of the ceremonial head covering or *kamumuri*. These modes were very numerous, each indicating the special right of some particular noble family. The sword always formed part of the ceremonial dress, the nobles wearing only one sword, whilst the samurai or military class wore two in the girdle. The author of the paper, in speaking of the female court dress, ventured an opinion that from an æsthetic point of view it was far inferior to the ordinary clothing of the ladies of the country, which seems so eminently fitted to make the most of their tiny stature and peculiar graces. The idea of the court costume seems to have been to aim at a gorgeous display of material at the expense of considerably dwarfing the proportions. It was a common thing to wear a robe having five separate edgings to give the appearance of as many different robes one over the other. The same remark as to artistic inferiority may be applied to the peculiar modes of dressing the hair among the court ladies; the more common fashions being far more attractive. In the court the hair is dressed over a carved core so as to form a large flat disc-shaped head-gear, ending in a long tress, tied at intervals by bows, and trailing down to the ground behind. The costume and toilet of the daughters of the nobles before becoming attached to the court resembled in most particulars that of the ladies of the *shizoku* class. Their pretty and suggestive modes of dress would be considered at length in a future paper.

The President, in returning the thanks of the meeting to Mr. Conder for his interesting paper, expressed his hope that the author would soon follow it up by the others in the series, treating of the dress worn in other ranks of life. A short discussion followed, but without adding to the information contained in the paper.

The meeting was then adjourned.

## SYLVAN SOUNDS.

(From the Japanese.)

## VIII.

## THE CAMELLIA.

A fleeting, transient world of blooms,  
So rudely riven by ev'ry blast,  
We breathe thy breath, we see thy smile,  
And so! thy glory all is past.  
Yet one among you sits a Queen  
Long regnant on her emerald throne.  
Though gleams the verdure, starred and strown  
With snow of blossoms tempest-blown,  
A jewel-flower, she holds alone  
Her beauty radiant and serene.

F. B. H.

Tokio, May 15th, 1880.

## JAPANESE NEWS.

[The following Notes on various Japanese matters are chiefly derived from the native papers, occasionally supplemented from original sources of information, and are carefully collated and edited, so as to make them readable and intelligible.]

## COURT, POLITICAL AND OFFICIAL.

Mr. Fukuoka Kotei, ex-Assistant Minister of Justice, was appointed a member of the Senate on the 14th instant.

The Mitsui Bishi Company's steamer *Hiroshima Maru* is said to have been chosen to convey His Majesty from Kobe, on his return from the provinces. The *Fuso Kan* is about to cruise round Japan, and will subsequently accompany the *Hiroshima* when His Majesty is on board.

The sub-marine cable between Hakodate and Mi-m'maya, having been damaged, Mr. Under Secretary Fukuta, of the Public Works Department, accompanied by one of the foreign employés, is about to proceed there to change the position of the cable.

Mr. Zeisho, Governor of Sakai ken, has been ordered to reach Tokio before the 26th instant. He is said to be transferred to another office.

Mr. Yoshii, Vice Assistant Minister for Public Works, is expected back in Tokio about the end of the current month.

The Japanese Post Office in Gusan, Corea, is to be opened for business on the 1st of next month.

His Excellency Hanabusa, Resident Minister to Corea, entertained Their Excellencies the Russian Minister; Inouye, Minister for Foreign Affairs; Admiral Enomoto, Minister for the Navy, and several other prominent gentlemen, on the 18th inst.

His Excellency Okuma, a member of the Privy Council, accompanied by His Excellency Sano, the new Minister of Finance, inspected the Printing Bureau on the 17th instant, and handed over the affairs of the Department to the new Finance Minister.

Mr. Takashima, Chief Superintendent of the Kobe Custom House, arrived in Tokio on the 17th instant.

His Excellency Tokudaiji, Minister of the Imperial Household Department, accompanied by Rear-Admiral Hayashi, Commander of the Eastern Naval Division, inspected the *Fuso* in Yokohama bay, on the 18th instant. This vessel, we believe, will convey His Majesty the Emperor from Kobe, on his return from the forthcoming Imperial tour.

It is said that the members of the Senate, who are now thirty-two in number, are to be increased to fifty.

The local assembly in Osaka is to be opened on the 4th of June next.

His Majesty the Emperor took part in a game of *dakin* (ball playing on horse-back) on the 19th instant, in company with the Imperial Chamberlains and the Masters of the Horse, in the park attached to the Imperial Palace.

We (*Nichi Nichi Shimbun*) hear that the Foreign Department has received information from the Board of Decoration, that His Majesty the Emperor is going to present the insignia of the Japanese Order of the highest class to the Kings of Italy, Belgium and Holland, and the Emperor of Austro-Hungary and the Heirs Apparent of Russia and Germany.

The local assembly of Kanagawa Ken is to meet on the 1st of next month.

Mr. Watanabe, the ex-Governor of Osaka, and now a member of the Senate, gave a farewell banquet on the 15th instant, at his private residence in that city, to the new Governor, and the Governors of Kyoto, Hiogo, Shiga, and Wakayama.

A native journal states that it is probable that females will be permitted to listen to the debates in the local assembly of Chiba Ken.

The branch office of the Colonial Department in Tokio was some time since erroneously reported to be closed.

It is rumoured (says a native journal) that the authorities are going to take steps to revise the Press Laws, and make them more strict, and also that the law of libel is to be altered.

The local assembly of Tokio met for the despatch of business at 6 p.m. the day before yesterday. Governor Matsuda declared the assembly duly opened, and lists of the subjects for discussion were distributed among the members by the President, Mr. Fukuchi.

The local assembly of Nagasaki was opened on the 13th instant.

When His Majesty the Emperor departs on his visit to the provinces, Their Majesties the Empress and Empress-Dowager, the Princes of the Blood, the Prime Ministers, the Privy Councillors, the Chokunin officers, and the Foreign Representatives will accompany the Imperial procession as far as the gardens at Naito Shinjiku.

A native paper states that a resident of Shika-no-Nura, in the district of Huraizumi, named Ishiguro Rintaro, has forwarded a memorial to the Colonial Department suggesting that a new harbour be constructed at the mouth of the Ootsu river, so as to afford facilities for shipping. This would, it is expected, give a great impetus to the development of the province of Tokachi. The memorial has been favourably received by the authorities.

The *Aikawa Shimben* says that "it is rumoured that His Excellency Sir Harry Parkes, Envoy Extraordinary and Minister Plenipotentiary from Great Britain, who recently returned home, is expected back here about the 6th of next month." This rumour is not confirmed by more reliable intelligence.

#### NAVAL AND MILITARY.

About 3,780 taubo of land in the neighbourhood of Akana-gaweki, and Dan-no-ura in the province of Choshu, Yamaguchi Ken, have been brought under the jurisdiction of the War Department for the purpose of erecting forts for coast protection.

The ministers of Russia and Austro-Hungary, accompanied by Generals Saigne and Oyama, the Minister of War, Admiral Enomoto, Minister of the Navy, and Lieutenant-General Ozawa, inspected the arsenal at Koishikawa, on the 11th instant.

We (*Hochi Shimben*) hear that when Colonel Munier, of the French Military Mission, was presented in audience with His Majesty the Emperor on the 5th instant, the Colonel received a present of a Japanese sword from His Majesty.

Rear-Admiral Akamatsu is shortly going to the hot springs of Shuzenji, in the province of Izu.

In consequence of the small number of men at present serving in the navy whose term expires during the current year, only three hundred will be required to fill the vacancies.

General Miyoshi arrived in Tokio from Osaka the day before yesterday.

We read in a native paper that on the 17th instant, Lieut.-Colonel Kinashi, Under-Secretary of the Home Department, had already been forty-nine days under arrest in his own residence, by order of the Military Court. It is said that this is from something in connection with a payment made in Mexican dollars to Yamashiroya Wasuke (formerly a leading merchant in Yokohama who committed *hankiri* owing to failure in business), while the Colonel was holding office as *Shujo* (Under-Secretary) in the War Department.

#### INDUSTRIES, TRADE AND FINANCE.

We read in a native journal that the Osaka Mint placed the sum of \$750,000 in trade dollars on the Kobe market on the 10th instant, in consequence of which Mexican dollars suddenly declined in value, and business in that port has been much improved. The Mint despatched 500,000 yen to Yokohama on the 11th instant, in the *Akitoshima Maru*, and will forward increasing quantities of coin in future.

A native paper states that some Japanese rice merchants in Yokohama have formed an association with some foreign merchants, to establish a rice company with a capital of \$10,000.

A late issue of the *Nichi Nichi Shimben* is responsible for the following:—"It is now currently reported among the populace that the authorities are about to purchase, at the current rate, all articles made of gold and silver, for the purpose of coining them into specie; and that any person or persons who refuse to dispose of, or who are discovered to have secreted any article or articles made of the precious metals, will be punished. We do not believe this to be the case. The Osaka Mint has lately been employed melting down gold and silver vases and other ornaments, and re-casting the metal into brick-like shapes, and has forwarded them to Tokio to be used in liquidating foreign loans. Some of the officers of the Expenditure Bureau having inspected the metal, mentioned the matter in unofficial circles, and thus the above rumour got into circulation."

A general meeting was held in the office of the Chamber of Commerce, in Tokio, on the evening of the 18th instant.

The wheat harvest for this year promises to be very plentiful in this neighbourhood, and it is expected that a fall in the price of rice will result therefrom.

The silver mines discovered by Tamashiro, at Kurama-yama in Kyoto, last year, now produce a large quantity of that metal.

A native paper states that seven or eight foreign merchants have closed their shops in Kobe, on account of the dull state of business, while on the other hand the Chinese traders are growing more and more prosperous, and of the goods imported nine-tenths are consigned to Chinese firms. We imagine our contemporary has got into confusion. Osaka is doubtless the port to which his remarks apply.

The *Hoya Shimben* contains the following improbable statement—"In consequence of the fall in kinsatsu, our Government is about to issue loan bonds to the value of thirty million yen, the principal and interest of which will be paid in specie. These bonds will be exchanged for kinsatsu, and the paper money destroyed. Thus about one-third of the paper currency will be withdrawn from circulation, and the value of the remaining kinsatsu improved. We cannot precisely say whether this proposal is under the consideration of the Government, or simply an opinion expressed by some patriotic private individuals."

The same paper states that "the Osaka Mint having received from an Englishman four or five million ounces of silver for coinage into yen, is now very busily engaged in executing the order. It is said that the money thus coined is intended for circulation in Hongkong and its neighbourhood."

The Stock Exchange Office in Osaka was reopened on the 18th instant.

The construction of the works at Nobiru harbour will require 230,000 yen beyond the original estimate.

The *Hochi Shimben* gives the following return of trade at the port of Fusan, Corea, for the half-year ending on the 31st of December, 1879:—

Export of Korean produce	Yen 346,561.22
Import of Japanese produce Yen	31,167.37
" " Foreign " "	282,714.85
	313,881.62
Excess of exports	Yen 32,679.60

#### MISCELLANEOUS.

Friday the 14th instant, being the second anniversary of the death of Mr. Okubo Toshimichi, religious ceremonies were performed both at his tomb in the Aoyamamachemeter, and his private residence at Sannenzaka. Some of the Princes of the Blood, the Prime Ministers, Privy Councillors, and other high functionaries were present.

A native journal states that the construction of the railway between Tokio and Takasaki is shortly to be commenced, and that the line between Otsu and Tsuruga is to be extended as far as the town of Ogaki, in the province of Mino. If such should really be the case, one-half of the whole length of the Nakasendo, (except that portion crossing the mountains in Shinano) will have a railway running parallel with it. If a line be constructed along the Kiso road, Tokio and Kyoto will be connected by rail, and travellers enabled to pass between the two cities in ten hours.

These have already been four fatal cases of cholera in the prefecture of Kanagawa, according to the native papers.

The new prefecture of Okinawa (Loochoo) consists of thirty-seven islands.

The new journal, the *Koku Nippo*, made its appearance on the 14th instant. The office is at Kobiki-cho, Tokio.

Work on the railway between Otsu and Tsuruga has been commenced at a point between Nagahama and Yanagase, and also between the latter place and Tsuruga. A tunnel, over twelve cho in length, is to be constructed, which is estimated to cost 300,000 yen; in addition, several smaller tunnels will be required on the line.

A telegram announces that a fire took place in the town of Hirowaki, in the prefecture of Awamori, at 11 p.m. on the 16th instant. Many streets were burnt down, comprising about two thousand houses, before the fire was extinguished at 8 a.m. on the following day.

Mr. Harimaya, the editor of the Sendai *Nichi Nichi Shinbun*, having criticised the recently issued meeting regulations in the editorial column of his paper, has been sentenced to one month's imprisonment.

The following table, compiled from native sources, shows the number and circumference of the swamps in Japan:—

Province.	Over 1 and under 2 ri.	Over 2 and under 3 ri.	Over 3 and under 4 ri.	Over 4 and under 5 ri.	Five ri and over.	Number in each Province.
Mitschi .....	3	—	1	—	1	5
Iwashiho .....	1	—	3	—	—	4
Kozuko .....	3	12	2	—	—	17
Mutan .....	1	1	—	—	2	4
Rikuchiu .....	—	—	1	—	—	1
Rikuzen .....	2	3	—	—	1	6
Shimotsuke .....	—	—	—	1	—	1
Shinosa .....	6	3	—	—	2	11
Suruga .....	1	3	—	—	—	4
Yamashiro .....	1	—	—	—	—	1
Total .....	18	12	7	1	6	41

The number of shrines throughout Japan, with the exception of the Okinawa Ken and the Ogasawara Islands, is 177,889.

The *Asahi Shinbun* of Osaka states that "according to current rumours, the local authorities of the city are, for some unknown reason, going to keep a strict watch upon all hotels where shizoku of Ishikawa Ken are now sojourning."

Mr. Kataoka, the representative of the Aikokusha, left for the prefecture of Kochi, on the 19th instant.

A fire took place in the post town of Totsuka, at about 3.30 a.m. on the 17th instant, and destroyed about 70 houses, 7 godowns, and 5 telegraph posts. One life was lost.

A number of people left the capital on the 18th instant in the *Tanai Maru*, for the new colony in Yesso.

The *Yamagata Shinbun* was released from suspension on the 12th instant, and has re-appeared since that date.

#### TELEGRAMS.

Portsmouth, 27th March. The *Portsmouth Times* says:—We learn by telegraph as we go to press that a rumour was current yesterday of the loss of the *Atalanta*, training ship, Captain Stirling, but the rumour proves to be unfounded, for she was sighted late at night.

London, 13th April.—Lord Lytton has been created an Earl under the title of Viscount Knebworth.

St. Petersburg, 20th April.—The official Russian press publish a Nihilist programme, which declares that the Russian Government being their enemy the end justifies all means for its overthrow. The publication of this document inaugurates a new method which the Russian authorities intended pursuing towards the Nihilists.

London, 23rd April. The *Daily Telegraph* publishes a paragraph stating that the anticipation is increasing that Lord Dufferin will be the new Viceroy.

#### INDIAN TELEGRAMS.

Cabul, 19th April.—The Kohistani and Koh-i-Daman Chiefs arrived here to-day, in response to our invitation to come in and make their wishes known. They seem very friendly disposed towards us, so the likelihood of a large gathering in the northward is for the present at an end. General Roberts receives them to-morrow, having abandoned his intention of going to Maidan.

Deserters from the Cabuli regiments in Turkistan have returned here, and confirm the recent reports. The Hazarahs are taking advantage of the advance of our troops and have attacked Ghuzni, and, rumour says, captured it.

Wali (Jan ?) Mahomed, it is stated, has fled to Logar taking with him Musa Jan.

The latest reports state that Mir Butcha is at Khoja Khidri, with two or three thousand men, under Gholam Kadir, Chief of Tagao. Sayed Abdulla, of Karizai, has joined him with three thousand men. Surwar Khan is still collecting men at Purwan.

It is believed the Kohistani Chiefs will wait to see what opposition our force encounters on the Ghuzni road, before attempting an attack.

The three Sirdars who led the opposition party at the Durbar are now working for us.

Abdur Rahman is said to be at Talagham with only a few of his old soldiers, and the Turkistan levies, in all about ten thousand. At Takht-i-Pal, twelve days ago he is reported to have put to death Kadir Khan, son of Sultan Mohammed Khan, Kizillash, and Gholam Aidin Khan, Barakzai, and one thousand officers and men for an alleged mutiny, whereupon the whole Cabuli troops broke and fled on the way to their homes.

Jellalabad, April 20th.—An attack is threatened on Sei Baba by the Sanlis of Tagao. The posts have been reinforced.

Cabul, April 20th.—General Bright reports the road to Gundamak is quiet; the number of Kohistani Khans and Mullicks who have come in to Cabul is about fifty, including several men of importance; there is no apprehension of disturbance in Kohistan, the chiefs have been well received and express themselves in a friendly manner towards the Government.

The force under General Ross halted on April 20th at Maidan, and advances on the 21st; there has as yet been no sign of any large gathering nor is such reported in advance. Some slight opposition was made to a foraging party and one man and two horses were wounded by the fire from a village. A small force has marched towards Chorasiah to hold Logar in check and prevent the people from joining in any gathering such as has been reported probable near Shekhabad. No serious opposition is, however, expected.

#### THE JAPANESE PRESS.

##### THE INFLUENCE OF PUBLIC OPINION.

(Translated from the *Nichi Nichi Shinbun*.)

ON the day previous to the *Nichi Nichi Shinbun* publishing the following article, another article headed "Difficulty of Finance," appeared, in which the writer dealt with the difficulties into which the finance of Japan has fallen, the depreciation in kinsatsu, &c., &c. The writer remarked that "the Finance Department, has lately been

working very diligently to restore the value of the paper currency by selling specie in the money market, in consequence of which silver that formerly stood at a premium of more than sixty per cent premium over paper money, has now fallen to about thirty per cent premium. However, when the Government stop the sale of specie, or when its supply becomes less than the demand, the value will again rise, and kinsatan fall as before, &c., &c." The writer then repeated what had been often previously pointed out by himself and many other journalists, with respect to the amount of inconvertible paper money now in circulation, the foreign and domestic loans, the price of rice being always accompanied by that of specie in its rise and fall, the deficiency of the ordinary revenue to cover the expenditure, a question which becomes more serious on account of the fall in kinsatan, the disadvantages accruing from a further issue of paper money, and the impossibility of an increase in taxation for the purpose of supplying the deficiency in the revenue, except as regards the customs, *saké*, and tobacco, which alone would not be sufficient. The writer concluded by asserting that the establishment of a national assembly is the only means for putting the finances of the empire in a satisfactory condition. We have referred to the article because it is connected with that we now translate.

"If the finance of our empire be entirely entrusted to the hands of a national assembly, we believe it would certainly be relieved from its present difficulty;" this is what we remarked in our previous issue. Our country being now thrown into a perilous position, if we wish to relieve it from its difficulties, secure the continuance of the Imperial line, and confer upon the people everlasting peace, we must carry on the administration of the Government in accordance with the views of public opinion. This is not the case with regard to financial matters alone and the reason why we believe that the administration should be conducted in the manner we have suggested is simply because the restoration of the financial position is the most difficult question of all, and every step to that end affects the people directly to a far greater than any other.

Now the questions of Legislative right and personal freedom, have also a very important bearing on the welfare of the people, but the desire for securing them arises from human nature, which causes all men to respect the rights and freedom with which they have been gifted by Heaven. Therefore, as regards the demands of the people in that respect, they merely display their natural character. However, as regards those classes of the public who have, in consequence of the habits to which they have been long accustomed, changed their original disposition, and never regard their rights and liberties as worthy of consideration, they would never venture to display their ardent desire to secure the birthrights of all mankind. The farmers, artisans and tradesmen, who compose the greater portion of the population, have been accustomed for many hundreds of years to be submissive to the oppression exercised by the military class during the feudal times; to live in a state of political slavery for their lifetime; to be stripped of the Legislative right; to have their personal liberty controlled; to leave their political rights entirely in the hands of their rulers, and to entrust their personal safety to the uncontrolled will of their sovereign. How sad is it then, that under such circumstances those people have entirely lost their natural disposition, and remained quite ignorant of what is liberty, and what are their rights. As a consequence, though they have fortunately happened to live under the present benign sovereign, they are unable to get rid of their old habits, are afraid of reforms, and are wanting in courage to apply to the Emperor to exercise the Imperial authority in due degree, by granting the people the rights and liberties to which they are justly entitled. If we examine the condition of our population of about forty millions, we will see that the classes we have mentioned still form the vast majority. This being so, it is evident that the agitation for the grant of political rights and freedom is kept up only by the men of knowledge and understanding who are known as reformers. Under these circumstances it would not be untrue for writers, defending the policy of the Government, to say that "the demand for popular representation and liberty, is the opinion of some few prominent people only, but not the desire of the bulk of the population."

The case is however entirely different with regard to

the pressure of financial difficulty. Even the people who care nothing for their political rights suddenly change the submissive character to which they have been so long accustomed when they are deprived of their means of livelihood, and, taking up their bamboo spears, and raising their mat-flags, oppose the authorities. Examples of this have been frequent. Why is it so? Because though they may remain content without political rights and liberty, yet they cannot withstand the pressure of want. Now the great difficulty of the national finances at the present day, is the pressure of want upon the bulk of the whole population. The currency they placed confidence in has now fallen to more than thirty per cent discount, and the articles they consume have risen more than thirty per cent in price. The people, who are both the users of the money and the consumers of the articles, have now in fact to suffer a loss of more than thirty per cent, therefore they are becoming extremely anxious at such a pressure being put upon them, and cannot longer remain in peace. They have now commenced to look about for relief from their distress, and if a national assembly be not established at present so as to provide a system for the relief of distress, we cannot say that the people will not sooner or later rise up themselves to seek for relief. The quiet devotion of the reformers who demand a national assembly for securing their rights and liberties is remarkable, but there is neither good order or good conduct, to be expected from an assemblage of starving people. If we desire to pacify the people before they form such a savage assemblage, we must establish a patriotic national assembly, which shall devise a system for the restoration of the finances of the country, so as not to permit the recurrence of such a state of affairs that the people find difficulty in obtaining the means of livelihood. If this proposal fails, we cannot think of any other means to restore the position of the country. A statesman not wishing to agree with our views, may form his own opinion, and say that "the only questions that could be discussed in a national assembly for the relief of the financial difficulty would be the increase of taxation, the raising of fresh loans, and the further issue of paper money, and therefore the establishment of an assembly would not prove of much interest." These are the words of one quite ignorant about "the influence of public opinion," and the reason why we suggest that the question of the relief of the financial difficulty should be laid before a national assembly, is not because we think the Government has no wise scheme in view, nor because there is no able functionary to carry it out, but simply because any scheme affecting the interests of the people to so great an extent, would be difficult to carry into practice except with the active coöperation of the public aided by the influence of public opinion. Now the whole Japanese nation is responsible for the inconvertible paper money in circulation, amounting to 113,427,992 yen, and also the foreign and domestic loans amounting to 249,829,982 yen; the total of which debt comes to 364,327,974 yen. But can we believe that every single unit of the population considers that he or she is a debtor to the extent of this vast sum and therefore responsible for its payment? Although the result is owing to a long period of irresponsible government in our country, yet, with the exception of those who have knowledge and understanding, the rest of the populace all think that the paper money and national debt are entirely matters belonging to the authorities, who and not the people, are responsible for payment. Is not this the case? When the whole population changes this idea, and realizes that every individual is responsible for the payment of the national debts, and accept it as a duty to relieve the financial difficulties of the country, the scheme for relief will be promptly and successfully carried out. If a national assembly approves the measure public opinion will do so as well, and therefore we repeat that if the finance of the empire is entrusted to the hands of a national assembly, we believe it will soon be restored to a satisfactory condition.

#### THE REPORTED RESIGNATION OF MR. OKUMA.

(Translated from the *Kinji Hiron*.)

WHEN the National Assembly of France determined upon a second issue of paper money, the then Minister of Finance, Mr. Necker, sacrificed his power and

popularity and explained the evil effects caused from the issue of an inconvertible paper currency. Finding, however, that the Assembly would persist in carrying out its resolution, he escaped to Sweden, and never afterwards returned to France. Again, when the United States of North America were engaged in the civil war with the southern states on account of the question of slavery, the finances became greatly reduced and were almost brought to an irremediable condition. Then the Minister of Finance laboured very diligently to remedy the financial difficulties of the country, but his advice not being adopted by the Government, he resigned and retired to England, never again accepting office. The action of these distinguished men has invariably been praised by the rightminded portion of the public in all countries.

It has lately been currently reported that Mr. Okuma, Privy Councillor, finding his views respecting financial affairs disapproved by the government, is going to resign his office; this report we reproduced in our journal as soon as we heard it, and commented upon it to the effect that the rumour might be unfounded and therefore untrustworthy. The report died away gradually, and was not heard of again for several weeks. Now, however, the rumour in question has been revived, and nothing occupies the mind of the public but the question:—"Is it true that Mr. Okuma is going to resign?"

It is said that it would be a proper course for a man of determination to pursue, to remain in his office as long as his opinions were adopted, but to resign when the government refused to follow his advice, and that Mr. Okuma finding the government opposed to his views, is now about to follow the examples of Mr. Necker, and the Finance Minister of the United States, and retire from office. Under such circumstances who would not praise the resolute conduct of Mr. Okuma? We much regret, however, if the report is true; because the public have always placed much greater confidence in Mr. Okuma than in any other member of the Privy Council, and we have all thought that, with the exception of Mr. Okuma, there was no one able to rescue Japan from the financial difficulty into which the country has fallen. Our present financial system having succeeded that of the Bakufu government, which was in a very impoverished condition, we cannot, of course, expect, to see our national treasury filled with gold and silver specie. Moreover, as the country was for many years in troubles, an enormous amount of money was required to meet current expenses, and, although surrounded with difficulties, Mr. Okuma showed his financial ability, and in the face of much adverse criticism, restored the credit of the government by raising the home and foreign loans, and issuing a vast amount of paper money. However, when there was a change in the Ministry this year, Mr. Okuma was removed from the office of Finance Minister and has since confined his attention to the Privy Council, while Mr. Sano, of whose capacity for the position we know nothing, has been appointed Minister of Finance. These changes greatly bewildered the public, but, after a short time, the government divided the Cabinet into six sections for administrative purpose, and Mr. Okuma was then appointed one of the members composing the financial section. Thus it was made apparent that the finances of Japan are still to be administered in accordance with the opinions of Mr. Okuma. But it is now rumoured that he is really going to resign office on account of his views not being adopted, and spend the remainder of his days in private life. We are very sorry if this is true, and not only do we regret Mr. Okuma's resignation on his own account, but also because we feel intensely anxious about the future prospect of our country. Now is it not the fact that the finances of the Japanese Government have been for many years administered by Mr. Okuma? No one but the Minister of Finance has the duty imposed upon him of proposing a scheme for the gradual withdrawal of the paper money now in circulation, amounting to over 110,000,000 yen, and the payment of the foreign debts which reach millions and millions. Must not Mr. Sano therefore feel very much embarrassed in having such difficult matters devolve upon him? We sincerely believe that Mr. Okuma should not act so unkindly as to leave Mr. Sano unassisted and helpless, and much more so because the annoyance does not concern Mr. Sano alone personally, but also our thirty million brethren. Ah! the present is not the time for Mr. Okuma, who

is an ardent patriot, to resign his important functions in consequence of trifling differences, and it would not be judicious conduct for a wise man to belie the promise of his whole previous lifetime on account of temporary irritation. If Mr. Okuma wishes to follow the examples of Mr. Necker and the United States Minister, it would not be too late for him to do so after he has brought the finance of the country into a sound and satisfactory condition.

## LAW REPORTS.

### IN THE U. S. CONSULAR GENERAL COURT.

Before General T. B. VAN BUREN, Consul-General,  
and Messrs. FOSTER, KEIL, MANLEY and  
OLMSTEAD, Associates.

*Tuesday, the 18th day of May, 1880.*

The case of John Martin Ross, charged with the murder on board the *Hullion* was continued.

Mr. G. W. Hill appeared for the accused as before.

After the Associates had been duly sworn, the Consul-General read the following decision upon the point raised by Mr. Hill, that the Court had no jurisdiction to try the case, the accused being a British subject:—

The question raised by the learned counsel for the prisoner affects the interests, not only of the prisoner at the bar, but of all who may hereafter be similarly situated. I have, therefore, given it all the consideration that the time and my limited references have rendered possible. I find by the authorities, that both the United States and Great Britain have ever held in jealous regard their jurisdiction over seamen sailing under their respective flags.

Wheaton, in his "Elements of International Law," an authority universally recognised, says (page 164): "In the early disputes between the two Governments on this long contested topic" (referring to the impressment of seamen from American vessels), "the distinguished person to whose hands were first intrusted the seals of the Department of State, declared that the simplest rule will be, that the vessel being American shall be evidence that the seamen on board are such. Fifty years experience, the utter failure of many negotiations, and a careful reconsideration of the whole subject when the passions were laid, and no present interest or emergency existed to bias the judgment, had convinced the American Government that this was not only the simplest and best, but the only, rule which could be adopted and observed consistently with the rights and honor of the United States and the security of their citizens. That rule announced, therefore, what would hereafter be the principle maintained by their Government. In every regularly documented American merchant vessel, the crew who navigated it would find their protection in the flag which was over them." Again (on page 174) he says: "The judicial power of every independent state then extends, with the qualifications mentioned."—(treaty qualifications)—"1st:—To the punishment of all offences against the municipal laws of the state, by whomsoever committed, within the territory. 2nd:—To the punishment of all such offences, by whomsoever committed, on board its public and private vessels on the high seas, and on board its public vessels in foreign ports. 3rd:—To the punishment of all such offences by its subjects, wherever committed. 4th:—To the punishment of piracy, and other offences against the law of nations, by whomsoever and wheresoever committed." And again:—"Thus offences against the laws of a state prohibiting or regulating any particular traffic may be punished by its tribunals when committed by its citizens in any place, but if committed by foreigners such offences can only be thus punished when committed within the territory of the state or on board of its vessels in some place not within the jurisdiction of any other state."

In "*The Queen v. Anderson*," reported in Vol. 1 of the "English Law Reports of Crown Cases Reserved," page 16, the doctrine is forcibly maintained by all the judges to whom the question had been referred, that the Courts of Great Britain had jurisdiction over, and British law prevailed in regard to, all offences committed on board British merchant ships, by whomsoever committed. In this case, an American citizen, serving on board a British ship, caused the death of another American citizen serving on board the same ship under circumstances amounting to manslaughter, the ship at the time being in the river Garonne, within French territory;

at a place below bridges and where great ships went. The French authorities refused to take jurisdiction. The Court, in banco, held unanimously—"That the ship was within the Admiralty jurisdiction" (of Great Britain) "and that the prisoner was rightly tried and convicted at the Central Criminal Court."

In the opinions of the Judges in this case, several American cases holding the same doctrine are quoted approvingly. Said Blackburn, Justice :—"The expression 'British seaman' may mean one who, whatever his nationality, is serving on board a British ship;" and again :—"It has been decided that a ship which bears a nation's flag is to be treated as a part of the territory of that nation. A ship is a kind of floating island;" and in reply to a suggestion from the counsel for the prisoner following the above from Mr. Justice Blackburn, that "If the ship floats into the territory of another nation it would cease to be so, and the jurisdiction of the flag would then be excluded, and this case might have been tried in France." Bovill, Chief Justice, said :—"Even if it might, why should not this country regulate the conduct of those on board its own vessels so as to have concurrent jurisdiction?" The Chief Justice also said :—"There are many observations to be found in various writers to show that in some instances, though subject to American law as a citizen of America, and to the law of France as being found within French territory, yet that he must also be considered within British jurisdiction as forming a part of the crew of a British vessel, upon the principle that a country is presumed to have control over its vessels, though they may be in ports or rivers belonging to another nation." The decisions of the U. S. Courts in "*Thomas v. Lane*," and the "*U.S. v. Combs*," support this doctrine. It would seem to me useless, had I a full law library in my possession, to quote further to establish a doctrine that will probably not be disputed. The difficulty, however, that presented itself to my mind when the demurrer was filed in this cause was whether the U.S. Consular Courts in this country, created under a treaty, by laws passed in pursuance thereof, could hold to answer any but American citizens; and, in view of the importance of the question, and of its national character, I considered it my duty to ask the opinion of the United States Minister in Japan. He has kindly given me his opinion, in which he maintains that by our existing treaty with Japan, and the statutes of the United States enacted to carry the same into effect, the exclusive jurisdiction to try this prisoner is in this Court. In deference to this opinion, although my mind is not entirely free from doubt upon the question, I have concluded to maintain the jurisdiction already assumed.

I suppose that the plea which has raised this question of jurisdiction might have been overruled without going into the merits of the question at all, as a demurrer must state causes appearing on the face of the complaint; as I have said, however, I have deemed the point of too great importance to be passed over in that way.

The demurrer is overruled, and the prisoner ordered to plead to the complaint.

Mr. Hill then moved that the prisoner should be discharged because no presentment had been made by a Grand Jury.

The learned counsel proceeded to argue that it had been supposed that some conflict existed between the statute in force here in Japan and the law in the United States, but such was not the case as he would demonstrate and prove. It could never be imagined that the great privilege of trial by jury was overlooked when the statute relating to American citizens in China and Japan was passed. He therefore warned the Court that they had no power to decide any question but one of law, questions of fact would have to be tried by a jury of twelve American citizens. If the procedure heretofore followed in the American Courts in China and Japan was opposed to the view he formulated and the law of the United States, then the former procedure must be laid aside. It was the duty of the Minister under the statute to prescribe the form of process and to direct the means by which a Grand Jury should be summoned, and if the Minister had not performed his duty the accused should not be prejudiced. There was no express provision in the laws of the United States as to the particular process and manner of summoning a Grand Jury. This is a matter to be regulated by custom or by the rules of Court, but yet it was universally true, and good law, that every person, except those belonging to the army, navy, or militia in active service, should be tried only after and upon

indictment found by a Grand Jury, and should be tried by a Petit Jury. However, if this was merely a preliminary examination he, speaking for his client, was prepared to waive it; but if the accused was supposed to be now tried for any charge involving homicide, he demurred to the right of the Court to hear the case in the form in which the charge is now presented and asked for an immediate discharge.

The Court retired to consider the questions raised by counsel.

On re-assembling the Consul-General delivered the judgment of the Court. He said:—In the first place addressing ourselves to the power of the Associates, the Court is of opinion that the statute is capable of a much wider interpretation than that put upon it by counsel. The Court is clear that it is the duty of the Associates not only to decide questions of law but of fact also. From the wording of the statute it is evident that the Consul and Associates have to concur in a conviction for murder, but the sentence cannot be carried out except with the sanction of the Minister. As to the remainder of the argument—that relating to the question of a jury—speaking for myself I must say, that my mind has never been quite clear on the subject. It is possible that at some future time the anomaly pointed out by counsel will be considered by a tribunal competent to decide the matter and settled. This Court, however, has come to the conclusion that it is bound to hear the present case and not strike out a line of procedure different to what has hitherto been the universal practice in American Courts both in China and Japan. The United States Court in San Francisco has jurisdiction to determine the point involved, if counsel thinks it necessary in the interests of his client to submit the question to that tribunal.

Mr. Hill then applied for a postponement for a period of five and a half months, or until the 1st of November next, to procure the evidence of persons resident in Prince Edward's Island, in the State of Maine, and in Nova Scotia. This motion was supported by an affidavit in which the accused stated that he would be able to prove that he was a British subject and liable from his childhood to fits of insanity, during which he was not accountable for his actions.

His Honour remarked that the motion for continuance might be made after the evidence of the witnesses now present was taken. In the present instance there was a good deal too much method in the madness to make the plea of any great value.

Mr. Hill then made a formal motion for a jury to try the accused, and supported it in a lengthy argument in which the learned counsel quoted largely from the case of *ex parte Milligan*, Wallace's U. S. Reports, vol. 4, decided by the Supreme Court of the United States.

Motion overruled, following previous decision.

The prisoner was then formally arraigned on the charge and replied that he remembered nothing about it as he was in liquor when he went on board. A plea of *not guilty* was recorded.

Mr. Hill applied for a list of the witnesses on behalf of the United States, and also that process should issue for certain witnesses required for the defence.

Adjourned until 1.30 p.m.

On the Court resuming.

John P. Reed, being sworn said :—I am the master of the American ship *Bullion*. The name of the second mate of the vessel was Robert Kelly. He is now dead. He died in the galley on board the ship *Bullion*, while lying in the harbour of Yokohama. He died about four o'clock on the morning of Sunday, the 9th instant. Between three and four o'clock in the morning I was called by one of the seamen named Samuel Scott. I was then in my berth asleep. Scott said :—"Captain, come up. Jack has stabbed Mr. Kelly in the neck." I turned out of my berth, took my rifle and went forward. As I passed the galley I looked in and saw Mr. Kelly lying dead. I inquired where Jack was. I mean by Jack, the prisoner. I was answered by one of the men, who said he was in the fore-castle. I went to the fore-castle door and called :—"John Ross." He said :—"Sir to you," and came right to the door, and put his hands out for me to put the iron on. I took hold of him with one hand, and he, seeing me with a rifle, caught hold of it and said :—"Don't shoot anybody." He wanted to go back into the fore-castle to get his jacket, but I told him he could not go back into the fore-castle any more. I ordered the men to take hold of him

which they did, and he was ironed and put in the carpenter's shop. The prisoner made a threat that he would kill the cook if he got a chance. I then called a sampan and came ashore to the United States Consulate and was directed to the police station and was there guided to the deputy-marshal's. With the deputy-marshal, one constable, and the undertaker, I then returned on board. When we got on board I gave over the corpse of Mr. Kelly to the undertaker, and the prisoner to the deputy-marshal. The body of Mr. Kelly was lying on the hatch. As the prisoner passed, one of the crew said:—"Let him see him." The sail lying over the body was turned back. The prisoner said:—"I can look at him every day of the week and then shake hands with him. I suppose I'll swing for it." I did not examine the body of deceased. Dr. Tripler did after it was put into the coffin. The undertaker, assisted by the crew, placed the body in the coffin. The prisoner is one of my crew. My ship is a documented American ship. The corpse was brought ashore and buried on Monday, the 10th instant.

Cross-examined by Mr. Hill:—The *Bullion* sailed from New York direct to this port. The accused was on board. The discipline on board my ship is not lax nor so strict as on board a man-of-war. I kept my rifle at the foot of my berth. It is generally unloaded. The steward comes into my room. The crew may have known I had a rifle as I have occasionally taken it out and fired it off on the voyage. I waited to load my rifle after I was called. The irons were in charge of the mate. It is usual to have irons on board vessels. It is a very common thing to use irons on board ship. It was about five minutes from the time I got the alarm until I got to the galley. I gave Ross liberty until 10 o'clock on Saturday night, and \$5 in money. I do not know whether he returned at 10 o'clock or not. I gave no orders respecting Ross to the officers.

Samuel Scott, sworn, said:—I am an able seaman on board the *Bullion*. At half-past three o'clock on the morning of Sunday, the 9th instant, I was going aft with a light, when I saw the second mate, the cook and the stewardess, come on board. I asked the stewardess to open the pantry door, and let me get the coffee-pot to make some coffee for the captain. She did so and said that as the captain did not like coffee, to make tea. The second mate, Mr. Kelly, then came into the pantry and asked for something to eat. He took a plate of cold meat and a plate of cold potatoes to the galley, and leaned on the dresser with one arm while he was eating. I then saw John Ross come aboard the ship with a bunch of flowers in his hand. He came to the galley door and saw the second mate eating. Ross said to Mr. Kelly:—"I'll pay you for this at daylight." Ross then walked forward into the fore-castle. After a while Ross came into the galley in different clothes. He then said to Kelly:—"Are you as good a man as you were on shore?" Kelly replied:—"Go away, my man, go away." Then Ross stabbed him in the neck with a sheath knife. Mr. Kelly exclaimed:—"Sam, Sam," and the blood gurgled in his throat. The blood spurted over me, and also over the food on the dresser. The prisoner tried to strike Kelly a second time and I left them and went aft to call the captain. Prisoner stabbed him a second time while I was absent. When I returned to the galley, Mr. Kelly was lying on the floor dead, and Ross had gone into the fore-castle. I was with the captain when he went to the fore-castle. When prisoner was looking at the corpse before going ashore he said:—"I can shake hands with him now and every day of the week." The knife produced is the one Kelly was stabbed with.

Cross-examined by Mr. Hill:—I saw Mr. Kelly, the cook, and stewardess come on board. The cook went to his room immediately. Ross said:—"I will pay you for this at daylight." I cannot say how long it then was before daylight. I did not hear Ross say:—"Now, Kelly, if you are as good a man as you were on shore come out on the main-deck." I was peeling potatoes and merely heard Ross say:—"Are you as good a man now as you were on shore?" When Ross came back from the fore-castle he had changed his clothes. He had his old clothes on. I cannot say whether his arms were bared or not. I never saw Ross carry the knife produced. He had usually a smaller one. I am quite sure he never carried the knife produced. Sailors generally carry sheath-knives on board ship. I do not carry a knife as a rule. I did so for a week or a fortnight when rattlin' down. The other men on board carry knives. It is not customary for the mates to

eat in the galley. The dresser is the board on which the cook cuts meat. I have seldom been in the galley. I have often looked in. I did not see any knife in the galley that morning, except one of the cabin knives which the second mate was using. It was the ordinary long knife used for cutting meat. It was a carving knife. Mr. Kelly was standing up while eating. Kelly fell on my shoulder at the first blow. Ross said nothing when he stabbed Kelly. The latter said:—"Sam, Sam," when falling on my shoulder. I supported him with my arm as he fell. I let him go and ran for the captain, he had not then fallen right down. He was standing when I left him. I cannot say whether Ross struck Kelly a second time, but he made an attempt to do so. When I left the galley Ross was standing at the door with his arm uplifted making a second thrust at Kelly, and Kelly was at the door bleeding. I never saw any difficulty between the parties before, nor have I heard either make use of threats against the other. When Kelly said:—"Go away, my man," he raised his hand, but I do not know which hand he raised. I do not know what time Ross came on board. He came about quarter of an hour or twenty minutes after the second mate. It was about a quarter of an hour before daylight when Ross came on board.

William Thomas, being sworn, said:—I am an able seaman on board the *Bullion*. I know the prisoner, he was one of my shipmates. I saw him on Saturday, the 8th instant, before he went on shore. On Saturday morning, after breakfast, the mate came forward and turned us to work. He sent me into a lighter alongside to rig a purchase. Some time after, John Ross came into the lighter. He said:—"George, are you going to ask the captain for your discharge to-day?" After a little talk he said:—"I'm going to ask him for mine and also for money to-night. I'm bound to go ashore to-night, money or no money." I advised him not to go. He said he was going ashore as he had made an appointment. He did go ashore. Next morning I was in my bunk and was woke up by hearing Ross say:—"You'll pay for this at daylight." Ross then came into the fore-castle to me. I pretended to be asleep. He shook me two or three times and I then answered him. He said:—"Here, George, is a bottle of whisky I have brought on board." I replied I did not want any, that he had better put it away until the morning, when he would want it himself. He drew the cork and gave me the bottle to have a drink. I put the bottle to my lips but did not drink any of the contents. I passed him back the bottle which he gave to another man, and then commenced to undress himself. He said:—"They tried to lick me on shore but they can't do it yet." Then pointing to his nose he said:—"See where Dutch Charley bit the end off my nose." He meant the cook. He took off his shore clothes and put on his belt and walked out of the fore-castle rolling up his sleeves. I could see a sheath on his belt, but I do not know what was in it. I then heard him say:—"Now it's you or me for it." I then heard him say at the galley door:—"If you're as good a man now as you were on shore come out here." I did not hear any reply, but I heard Ross say:—"I'll cut the b—— Irish heart out of you, G—— d—— you." He then returned to me holding his knife in his right hand and holding up his left hand. He wiped the blade of his knife on his left hand, and then putting his hand over to my face said:—"There's his heart's blood." I turned out and ran to the galley door, and saw another man turning Mr. Kelly on his back. I returned to the fore-castle and took Ross's knife from the beam where he had placed it and stowed it away. The knife produced is the one. I heard the captain say:—"Where is Jack?" Ross answered:—"Here I am captain Reed," and he walked to the fore-castle door saying:—"Put them on yourself, captain." When he saw the captain had a rifle he caught the barrel and said:—"Don't shoot anybody captain," and also:—"Hold on, let me have my coat." He turned round but some one caught hold of him and hauled him over the step of the door on his back. He was then ironed and put in the carpenter's shop. It is about ten or twelve yards from the galley to the fore-castle door. When Ross returned to the fore-castle with the bloody knife in his hand he said:—"If that Dutch——was on board, I'd serve him the same."

Cross-examined by Mr. Hill:—Ross placed the knife on the beam when he came into the fore-castle. He had no knife in his hand when he left the fore-castle rolling up his sleeves and making threats. Ross did not generally carry a knife.

There was a sheath on his belt which that knife would fit. He had another knife which he usually worked about the ship's deck with. I never heard Mr. Kelly make use of any threats against Ross. I saw Mr. Kelly just before he died. He was speechless but breathing. He made no motion. I saw the wounds on his cheek and arm, but not in his neck. The wounds were on his left side. When I went to the galley Kelly was lying inside but with his head towards the door. After the prisoner was locked in the carpenter's shop I saw a carving-knife on the dresser in the galley. Bennett was the only man with the body when I went to the galley. Mr. Kelly was in his shirt sleeves, dark vest and pants, and his feet had low, thin shoes on them. When Ross spoke about going ashore he said:—"I'm going to meet her." I did not ask him who he meant, because I knew already. I noticed that Ross' face was scarred slightly when he came on board. He was marked on the cheek and nose. His shirt and the collar of his vest were all over blood. Ross made use of no other words that I recollect and did not seem to show any passion or temper.

By the Court:—Ross was not drunk when he came on board.

To Mr. Hill:—I never saw him drunk. I consider a man is drunk when he can only stand with difficulty.

By the Court:—When I say Ross was not drunk I mean he was sober, and apparently knew what he was about.

Mr. Hill objected to the last question and answer.

Charles Brown, being sworn, said:—I am cook on board the *Bullion*. I was on shore on the night of Saturday, the 8th instant. I saw the prisoner on shore and also Mr. Kelly. I saw them in the "Shamrock," kept by Mrs. Glass, about nine o'clock. Ross came in and we took a drink together. Then we had a game of cards. Then Kelly came in and called me on one side and said:—"I'm going to lick John Ross to-night." I asked him why, and he replied:—"It is a business between me and him." After a while Ross went out and I said that we had better get down to the ship. Kelly, myself, and the stewardess, went down to the hatoba. While we were there Ross came down. Mr. Kelly said:—"There's John Ross now." Kelly then pulled off his coat and Ross made for him, and knocked him down on the ground. I said:—"No fighting here," and I pulled him off Kelly. Ross then called me out of my name and hit me in the stomach. I fell on the ground and bruised my knee and leg. After Kelly got up he went for Ross and got him down and beat him, and kicked him with his feet. I then said to Kelly that we had better get to the ship now. Mr. Kelly replied:—"No, Ross is going on board and there will only be a disturbance in the ship." We then went up town and visited several public houses, the last being the "California," where we met the chief officer of the *Charles Dennis*. We all left and went on board about two o'clock, the mate of the *Charles Dennis* going on board his ship. I turned in when I got on board. I saw Mr. Kelly's dead body next day. I was not present when the body was shown to Ross.

Cross-examined by Mr. Hill:—I was quite sober on the evening in question. I was drinking brandy, gin and lemonade. I had one glass of brandy and two of gin. I have told everything that took place. Ross and I had a little disturbance at Mrs. Glass's. Mr. Kelly, the stewardess and myself went away from the hatoba together, leaving Ross there. I next saw Ross at the "California," I did not mention that before. I had been on shore two days. Mrs. Burns keeps the California Saloon. Kelly brought us there. The first time I saw Ross that evening was at a place kept by a man named Flint. I had a drink there with Ross. I did not see Mr. Kelly at Flint's talking to another man about taking his (Kelly's) place. I did not hear him say so to anyone at anytime. Flint's place is the "Richmond." The stewardess came in there afterwards. I did not drink there with Mr. Kelly at all. Ross then told me when he intended to go on board. He said he would go about 10 o'clock. When I left the "Richmond" I was alone. Ross remained there. Ross was not at the "Shamrock" when I got there. The stewardess was at the "Shamrock" in the meantime, and went to Flint's to get a jacket she had left there in the morning. When she returned to the "Shamrock" John Ross accompanied her. I was standing at the door when they came up. The stewardess was not at the "Richmond" when I was there. She was at the "Shamrock" and sent me for the jacket. I played cards with Ross that evening. The first house we went to after we left the hatoba was kept by a Japanese. We had a drink there. Then we went to the "California," and had several

drinks. I should think it was about an hour and a-half after we left the hatoba until we reached the "California." We spent the intervening time at the Japanese house. We took a private room in that house to sit in. We had nothing to eat there and did not play cards. We all went to the "California" together. They were shutting up when we went there. Two ship's officers were sitting in the place. We stayed there about an hour and a-half, or two hours. One of the mates went away and the mate of the *Charles Dennis* remained, and went on board with us. While we were in the "California" I did not see any foreigners come in. We had a private room. A widow woman and her daughter keep it. Ross was at the "California" with the two mates when we went there. Ross did not come into the room we were in, he stopped in the bar. There is a door, which was kept closed, between the bar and the room we were in. As we passed through the bar Ross caught hold of my shoulder and said:—"Look what they have been doing to me?" He had then some wounds about him. The boots I have on now are the same I wore on that evening. Ross's wounds were on his face. Kelly had gone on into the private room and I remained taking to the mate of the *Charles Dennis*. I was not more than a minute talking to him. He spoke to me and I answered him. I took nobody's part in the tussle on the hatoba. I took Ross off Kelly. I was not fighting myself. The scuffle lasted about five or ten minutes. The stewardess walked some distance off and said:—"Come away, dear, don't fight." When I pulled Ross off Kelly, Kelly got up. Kelly then knocked Ross down and kicked and beat him all over. I stood still and saw Kelly beating him. Ross was lying on his back when Kelly kicked him. I do not know what part of Ross Kelly kicked. Ross called out for the police. Kelly told me that if I interfered he would lick me. The stewardess was about five yards off. I have told all I know about the threats Mr. Kelly made against Ross. I pulled Ross off Kelly, but I did not interfere when Kelly was beating him, my wife called me away. I did not see any hair pulled out. The affair on the hatoba did not last more than five or ten minutes.

Adjourned until 10 o'clock on the following day.

Wednesday, the 19th day of May, 1880.

The Court resumed at 10 o'clock a.m.

Thomas H. Tripler, being sworn, said:—I am a physician and surgeon practising in Yokohama. I was on board the ship *Bullion* on the morning of the 9th instant. I heard there had been an accident on board, and being retained for the vessel I went there. I had not been sent for. I saw the body of the second mate lying in a coffin on board. I examined the body. There was a wound about four inches in length across the left forearm, which had divided the muscles, leaving the bone exposed. There was also a superficial wound in the left cheek and a deep wound in the neck. The wound in the neck was about three inches in extent, and divided the muscles and superficial structures, and also the left common carotid artery and the left internal jugular vein. In my opinion death was caused by hæmorrhage from the wound in the neck. I did not see the prisoner on board.

Cross-examined by Mr. Hill:—The inside ulnar artery was severed by the wound in the arm. If there had been no wound in the neck such as has been described, the hæmorrhage from the ulnar artery might have been serious. Hæmorrhage from that artery sometimes ceases spontaneously, but the effects are apt to be perilous. If an artery such as the ulnar is severed, the patient would probably bleed to death in about an hour. I can say positively that the ulnar artery in deceased's left arm was severed with a sharp instrument. The external jugular vein could be easily severed without severing the artery, but not the interior jugular vein, as it lies in the same sheath as the artery. The wound in the neck was evidently made with a sharp, steel instrument. The wound in the neck was on the left side and extended from the clavicle to the medial line. The effect of such a wound as deceased received would not be to cause a man to fall immediately as if struck with a hammer. He would fall within half a minute from the exhaustion caused by hæmorrhage. A man receiving such a wound would be able to make physical exertion for a few seconds. The

wound in the arm was similar in appearance to that in the neck. They seemed to have been made by a slightly blunt instrument which gave the wounds a ragged appearance, and not the clean incision made by a razor. The deceased must have been holding up his arm when the wound was inflicted upon it. The wound was in the inner side. I do not think it possible that deceased could have himself inflicted the wound upon his arm while another man was stabbing him in the neck. The wound in the arm could have been given after the wound in the neck, by the same person and with the same weapon. The most reasonable supposition is, that the wound in the arm was inflicted first, but it might have been inflicted after that in the neck. The carotid artery was severed. A man could speak intelligibly for a part of a minute after the artery being severed. It depends upon the position of the neck how long a man would live after the artery was severed. He might live two minutes or die almost instantaneously. If, in falling, the neck got twisted, it would check the hæmorrhage.

John Coyle, being sworn, said :—I am an able seaman on board the *Bullion*. I know the prisoner at the bar. He was one of the seamen on board. I saw him in the fore-castle on the morning the second mate was killed. About half-past three that morning, prisoner came to the side of my bunk. He caught me by the shoulder and asked me to get up and have a drink. He had a ginger beer bottle with whisky in it and was trying to get the cork out. He could not get the cork out and he then passed me the bottle. I took the cork out with a nail. I gave him the bottle and he took a drink out of it and then passed it to me and I took a drink. I then handed the bottle to James Bennett. Prisoner then came to me and took me by the right hand and put it to his head that I might feel some bruises he had. I asked him who had been doing it and he replied :—“Mr. Kelly and Dutch Charley, ashore.” Prisoner then showed me where the cook had bitten him on the nose. His nose was scarred. He said :—“Those two ——— tried to beat me on shore, but they can't beat me yet.” I then got into my bunk and prisoner said he was going out on deck. He had changed his clothes while in the fore-castle. I then heard him, abreast of the galley, say to Mr. Kelly :—“If you are as good a man now as you were on shore, step out on the main deck.” I did not hear Kelly reply. I then heard prisoner say :—“I'll cut the Irish heart out of you and that Dutch ——— too if he was on board.” I did not see him again until he came abreast of my bunk, which was below his. He showed his left hand to William Thomas, whom we call George, and said :—“There's his heart's blood.” He then shined his knife twice on his left palm. George sprang up in his bunk and said :—“By G ——— he has done it!” George ran out of the fore-castle and I went after him. When I got to the galley door I saw Mr. Kelly lying on his back with his head towards the door. I returned to the fore-castle and found prisoner standing by his bunk on the point of turning in. As I came in he said :—“Those ———.” I stood alongside of him until the captain came, when prisoner went out to the door saying, holding out his arms :—“Here you are captain, shove them on yourself.” When he saw the captain had a rifle, he put it on one side saying :—“Do not shoot anyone.” Prisoner then said :—“Let me get my coat.” George threw it out to him. He fell on the deck at the door, and remained on his back until the irons were put on him. We then got him on his feet and walked with him until we got abast the galley. The captain then said he would not keep him aft, and we brought him forward again and put him in the carpenter's shop. He asked me for a smoke and some water to drink. The chief mate gave him water. I was not present when he was shown the body of deceased. The knife produced belongs to the prisoner. I never saw him use it. Sailors generally have two knives, so that in case they lose one, they have another to fall back upon. I have seen him sharpen this knife. I have used it myself oftener than prisoner. It was lying on the beam, and I used to take it down and cut tobacco with it. Prisoner was under the influence of a little liquor when he came into the fore-castle that morning. He was a little lively. He may have had five or six glasses in him.

Cross-examined by Mr. Hill :—I never saw this knife carried in a sheath. It is of the ordinary size and might fit in the sheath prisoner usually wore.

By the Court :—The knife produced is the one he wiped on his hand.

James Bennett, being sworn, said :—I am an able seaman on board the *Bullion*. I know the prisoner. I saw him on board the morning the second mate was killed. On Sunday morning, the 9th of May, I had the anchor watch from two to three. At three o'clock I called John Collins; when he came on deck I went below and turned in. At nearly four o'clock I heard prisoner on deck saying :—“Kelly, you'll pay for this at daylight.” He then came into the fore-castle and turned the light on. I saw he was all disfigured with blood. He had a small bottle of liquor. He passed it to John Coyle to open. He then commenced telling us how Kelly, the cook, and someone else had beaten him ashore. He said there were three beating him. While telling us he changed his clothes. He put on his everyday working suit. He then took a drink out of the bottle he had brought on board, and put on his belt and sheath. He went towards the fore-castle door, rolling up his sleeves. He said :—“Now, you or me for it.” About a minute afterwards I heard prisoner say :—“Now Kelly, are you as good a man as you were ashore?” The next thing I heard was prisoner saying :—“I'll cut the heart out of you, you ———.” Directly afterwards he came into the fore-castle. I saw a knife in his right hand and he commenced wiping it on his left hand as he came in. He said :—“Look there, there's his heart's blood.” He then, stuck the knife in the beam overhead. I jumped out of my bunk and ran to the galley. When I arrived there I saw no one until I looked upon the floor, when I saw the second officer lying face downwards. I took hold of him and turned him on his back. One of the other men came along, and I told him to fetch the captain or the mate. In turning Mr. Kelly over, I saw a large carving knife lying underneath him. I held it up to the light and then threw it on the enphoard. Just as I did so prisoner came to the galley again. He said :—“I told you I'd fix you for double-banking me.” He addressed Kelly. “Double-banking” means two people attacking one. Prisoner made no demonstration towards striking Mr. Kelly. I jumped up and told prisoner to go away. I said :—“You've killed him.” Prisoner then went forward to the fore-castle. Directly afterwards the captain came forward. The captain was armed with a rifle. Some of the men were with him. The captain looked in at the galley door and then proceeded forward to secure prisoner. I stopped in the galley until the men came to look at Kelly. After prisoner was ironed he was put into the carpenter's shop. He asked for water, which I brought him. He said :—“It's that Dutch ——— is the cause of all this. After last night I know what she is.” I saw prisoner given in custody to the deputy-marshal. As prisoner went by where Kelly's body lay he said :—“Now I can shake hands with you any day of the week.” Prisoner was passed over the side and after shifting moorings Mr. Kelly's body was passed over. When prisoner came into the fore-castle that morning he was about half drunk.

Cross-examined by Mr. Hill :—There was a sheath on the belt when prisoner put it on. The belt was the ordinary one he wore to keep up his pants. He had nothing in his hands when he left the fore-castle. He was rolling up his sleeves in an excited manner. I held up the knife I found under Kelly's body to the light, to see if there was any blood upon it. It was a long carving knife. Kelly lay alongside the dresser and the knife was under his body. There was no blood upon the knife.

Mr. Hill :—Supposing Kelly when holding the carving knife in his hand had received a mortal blow in the neck, and fell in such a position that the knife was found lying under him, in such case do you think the wound in his left arm was given by his falling on the knife?

Witness :—I do not think so. I held the knife up to the lamp and turned it and saw no spot of blood on it. I put the knife on the dresser. I took no more notice of it.

This closed the case for the prosecution and the Court adjourned until half-past one o'clock.

On resuming, the Consul-General mentioned, that the Court had just been put in possession of the fact that one of the men on the ship was prepared to testify that he went into the galley just after the stabbing took place and supported the wounded man, and in doing so, knocked off

the dresser the carving knife that was found under the body of deceased, and that the Court proposes to reserve the right to call that witness at the next sitting. Counsel for the prisoner states that under the circumstances he does not feel at liberty to consent to such reservation, the Court thereupon waives such examination.

Mr. Hill then proceeded to argue the motion for a postponement and remarked that the practice in the courts he knew was, that when a motion of the kind was made in good faith, the adjournment went as a matter of course. If he failed to show that the present case was one of manslaughter, it would be of vital importance to his client to be able to procure the postponement.

His Honour:—The difficulty is, that if all the facts mentioned in the affidavit were proved, it would not assist in the present case, unless it was shown that the prisoner was in an insane fit at the time he committed the offence with which he is charged. No such allegation is on the record. The motion is therefore overruled for the present.

Mr. Hill then made an application for a postponement for one month on the ground of the bias and intense feeling entertained by the community against the prisoner. An affidavit in support, made by the prisoner, was put in.

His Honour stated that any objections to the Associates could have been taken before they were sworn, the Court was of opinion that the motion came too late and it was therefore overruled.

Mr. Hill then mentioned that he reserved all the objections he had taken to the power of the Court to form an opinion on any question but one of law. Not being able to establish the plea of insanity in consequence of the postponement being refused, he would have to show that the crime was less than one of murder.

G. W. Elmer being duly sworn, said:—I brought the prisoner on shore on the 9th instant and lodged him in gaol. I examined him and found what I took to be a cut across the end of his nose and an abrasion of the skin underneath the nose. His right eye was considerably blackened. That was all I noticed on Sunday. On Monday he complained of being sore and I had him examined by the doctor. He had a large scar on his left knee and several bruises on his back from his shoulders to his loins. There were less bruises on the right side than on the left. The bruises were about two inches long, and from a quarter to a half an inch in width. All the scars were something the shape of the toe of a boot. He had a lump on his head. The bruises were of a reddish tinge. They were vertical. The other marks on his head were a lot of little red marks as if pins had been stuck in, or hair pulled out. I saw several of the crew when I went on board and the body of the man who is dead. I know that Mr. Kelly had low shoes on. I noticed the boots the witness Brown wore yesterday when he was testifying. I cannot say if his boots were heavier than those Kelly had on.

Kuma Ishikawa, being warned to speak the truth and examined through the interpreter, said:—I saw a fight between some foreigners on the night of Saturday the 8th instant, on the hatoba. There were three men and one woman engaged in it. I think it was about half-past eleven o'clock. The fight took place underneath the lamp-mast at the end of the hatoba. I was asleep in my boat and heard the noise of jinrikshas coming along the hatoba. There were people in them and they got out. One was a woman. There was a man walking in front of the jinrikshas. Two men and one woman got out. Shortly afterwards I saw them fighting, but I did not see them commence. Two men were fighting. One caught the other by the beard and threw him down. The third man then put his hands on the box upon the lamp-post, and jumped on the man who was on the ground, with his feet. The two men were on top of the man on the ground at the same time. The man who was on the ground seemed to be insensible. The woman went to the man who was jumping upon the man who was down, and tried to get him to go away. She first called him by name and then went up to him and took hold of him as if to pull him away. The man seemed to want to stop and still jump on the other. The woman then kissed the man who was jumping on the other man and he stopped. The woman and two men then went away leaving the third man on the ground. The prisoner looks very like the man who was on the ground. The man got a lamp

from one of the scavengers and showed me his bruises. He wanted me to examine them but I would not do so as he was all covered with blood. He was very urgent, and I looked at them casually to satisfy him. During the fight the prisoner was the only man whom I saw on the ground. I did not see them get out of the jinrikshas. One of them called out for a sampan and I got up. I saw one man get out of a jinriksha where the mail boat goes off and then go down to where the Yokosuka boats go off. I am confident that was the prisoner. I did not see the first of the fight. I heard loud voices and then went on the hatoba.

Walter Loxton, being sworn, said:—I am a sergeant of police. On Sunday morning the 9th instant, I went to the hatoba and saw the last witness who said there had been a fight there the night before. In consequence of this information I went to the place pointed out at about half-past ten o'clock on Sunday morning and found a great quantity of hair and a small pool of blood. The blood was about six inches or a foot from the motor box of the light, and the hair was all scattered about. I picked up the hair produced.

John P. Reed, being recalled and sworn, stated:—I think Mr. Kelly the deceased had a smooth face and a small moustache. I do not know if the witness Brown has a beard or not.

Alfred Stauley, being sworn, said:—My shipmate Brown has no beard. He might have a slight one, but I think not. Mr. Kelly had a light auburn beard. The hair produced is nothing like either Kelly's or Brown's. On Saturday night the 8th of May I was on shore. I saw Mr. Kelly and the prisoner together. The house I was in is kept by Mrs. Glass. Mr. Kelly was not in the house while I was there. I was there about an hour. I saw Brown there. I saw no difficulty between Kelly and prisoner; I did see one at about nine o'clock between Brown and prisoner. I was at Mrs. Glass's from about eight to nine o'clock. I know that Mr. Kelly and the prisoner had no ill-feeling to one another previously. I know also that from the first of the passage there has been an ill-feeling between the prisoner and the cook. In common with the rest of my shipmates I can guess how that ill-feeling was engendered. I believe the murder was caused through the extreme jealousy prisoner entertained towards anybody who interfered with the stewardess. Mr. Kelly told me to go into Mrs. Glass's and tell the stewardess he wanted to see her. I did so. The prisoner, the stewardess and Brown were in the bar together. I told the stewardess Mr. Kelly was outside waiting to see her. The cook asked me to have a drink. The prisoner had his coat off at the time challenging the cook to go outside and fight. He was making use of very obscene expressions. I tried to pacify him but could not do so. I then asked the stewardess what kind of a woman she was, going ashore with her husband and making appointments with two different men, one in the house and the other outside waiting to see her. I opened the door to see if Mr. Kelly was outside, and when I returned I heard the stewardess say she loved Ross better than she did her own husband. I did not hear any threats made by Kelly.

Cross-examined:—I did not hear the prisoner threaten Kelly. I heard the prisoner say:—"What the h—does Mr. Kelly want about here?"

Counsel for the prisoner here took exception to the withdrawal of a question put by the Court, viz:—"Did you not state to me, and did I not take it in writing, that you heard Ross make a statement like the above?"

Mr. Hill called attention to the fact that the hair produced in Court had been pulled out of the prisoner's beard.

Harriet Brown, being sworn, said:—I am the wife of the cook. I was present on the hatoba about ten days ago and saw a fight in which Mr. Kelly, my husband, and the prisoner were engaged. I saw the whole of the fight. Mr. Kelly had his jacket off when the prisoner came down on the hatoba. I heard Mr. Kelly say:—"There is John Ross coming. If that is John Ross I'm going to lick him, and kill him and throw him in the water." I said:—"No, Mr. Kelly, you must not do that." He replied:—"That is nothing to do with you, it is between me and Ross." Before that Mr. Kelly called me on one side into a room with my husband. He said:—"I've got something against John Ross. I want to lick him for that." This conversation took place at a house in town. The prisoner came on to the hatoba,

and as soon as he stepped out of the jinricksha, Mr. Kelly put his arm round him, and I cannot say who was down on the ground first. Mr. Kelly cried out:—"Charley help me." That was to my husband. My husband went to prisoner and got hold of him. The prisoner gave Brown a kick, and he fell down. I got frightened and ran away. Kelly called out again:—"He'll murder me." I then went back and got hold of Ross, and found I could do nothing. I then went away. I did not hear any one say to Ross, "If I had had charge of you I would have put you overboard long ago."

Mary Glass, being sworn, said:—I saw the prisoner a week ago last Saturday at my house. I saw Mr. Kelly there that night. They seemed to be the best of friends. Nothing was said to me by either of his feelings towards the other. I do not know the cause of the difficulty.

This closed the defence.

Mr. Hill then addressed the Court on behalf of the prisoner, and urged that the testimony would not support a verdict of murder, as there was no proof of malice aforethought and previous intent. The circumstances upon which the prisoner relied to show no premeditation were, that the knife used was carried ordinarily by seamen, that he had been drinking, and that all his actions, rolling up his sleeves, and challenging to fight, show that no preparations had been made to commit the offence. All the circumstances went to show that there was no premeditation, and he would therefore confidently leave the matter in the hands of the Court.

The Court then adjourned until 10 a.m. on the following day.

#### Thursday, the 20th day of May, 1880.

The court-room at the United States Consulate-General, was crowded to hear the sentence on the prisoner.

When the Court assembled, the Consul-General desired the prisoner to stand up and addressing him said:—

Prisoner, you have had a careful, and, as the members of the Court believe, an impartial trial, and you have been defended by able and zealous counsel, who has done everything possible in your behalf. The evidence shows that on the evening of the 8th of May instant, you were on shore, and a portion of the time in company with Robert Kelly, the second mate of your ship. During this time bad blood was engendered between you, which resulted in a fight at the batoba, in which you appear to have received a number of bruises and injuries. Some three or four hours after this you went on board your ship, the *Bullion*, and seeing your victim in the galley, eating his supper, you stopped at the door, and threatened him with your swift-coming and merciless vengeance. You then proceeded to the fore-castle, and, showing your comrades your bruises, you cursed the alleged authors of them, and boasted of your coming deed of blood. You deliberately removed your clothing and put on your every day suit, and, buckling about your waist the belt and sheath in which you placed the large and well-sharpened knife, which you kept only for special occasions, you left the room rolling up your sleeves, and announcing that the time had come for exacting your revenge. You then proceeded to the door of the galley and called Kelly to come upon deck. He not heeding you cursed and derided him and threatened in foul terms to cut his heart out, and then, without a moment's pause, you jumped upon him, and thrust your knife into his neck, causing the blood to spurt over your comrade who was working in the galley, over the food the poor man was eating, over the dresser, and to stream down over the clothing of the stricken man. And then, upon the body of this dying, defenceless man, your vengeance not satisfied with his life, you struck with your knife repeated blows. Then going out of the galley for a moment, you returned to the door to gloat over your deed, and mocked at the victim you had done to death. You then went again to the fore-castle, and, wiping your bloody knife upon the palm of your hand, you held the latter before your shipmates, and bid them look upon the heart's blood of the murdered man. During all this time you were self-possessed, calculating, deliberate. You were not drunk, but had swallowed just enough of the vile compounds sold in the dens of Yokohama to fit you for the deed you contemplated. A more deliberate, foul, and malicious murder it would be difficult to conceive. The Court

accordingly convicts you of the murder of Robert Kelly on the morning of the 9th of May instant, in the galley of the American ship *Bullion*, while at anchor in the harbour of Yokohama, as laid in the charge, and you are sentenced—

Mr. Hill asked that the sentence of the Court should be delayed, pending the decision of the points he had raised.

The Consul-General stated that the Court could not grant the application, as the sentence was part of the judgment of the Court, and continued:—And you are sentenced to suffer death in such manner and at such time and place as the United States Minister in Japan may direct according to law, and may God have mercy on your soul.

The prisoner, addressing the Court, said:—I do not remember the first thing about it, your Honour. If I did I would not be ashamed to own it.

His Honour:—That may be. Your counsel will take all necessary steps on your behalf.

Mr. Hill gave notice of appeal, and the Court adjourned.

#### IN H. B. M.'S COURT FOR JAPAN.

Before R. T. RENNIE, Esq., Judge.

Saturday, the 15th of May, 1880.

VINCENT MIZZI, Steward, British barque *Flecher*, vs.  
OKE RIDDERBOLKE, Manager Temperance Hall.

This was a suit brought to recover money alleged to have been wrongfully taken by defendant in his capacity as manager of the Temperance Hall.

The plaintiff gave evidence to the effect that when he had been discharged from his previous ship there had been a balance of \$17.80 due him. He had been sent by the shipping master to the Temperance Hall, and after living there two days, the runner got him a situation. After being three days on board, he had come on shore and shipped, drawing at the same time an advance note for £4, which he gave to the runner. The latter gave him \$10 and he received \$5 from the manager. The charges were, \$2 for board and lodging, \$2 for shipping and discharging, \$10 for finding the situation, \$6 for cashing the note, and \$5 for guarantee.

F. E. White, constable to the Consulate, gave evidence that the \$17.80 had been paid to the runner of the Hall, who was in the habit of doing such business. Witness considered the charges of \$10 for finding a situation and \$6 for cashing the note, excessive, if same were paid.

Defendant, on being called on for his defence, stated that he was a Swedish subject; and though the Court explained that, by defendant's consent, the case could be gone on with, as he was manager of a public institution, defendant objected, and with a few severe remarks from the Bench on the waste of time caused by the withholding the plea till so late, the case was dismissed.

#### THE WITCHES OF THE CORDILLERAS.

I warn you that I cannot explain what I am going to tell you; but I am sure I did not dream it. I never used to believe in witches and magic, and I don't think I do now. I had often, during my wanderings about South America, heard vague stories about witches and magic, but it was long before I could get any one to tell me at all explicitly what the belief of the people was. At last I was confidentially assured by a well-informed and extremely cautious acquaintance that there really were witches; that though they were scattered about the country, there were places which were their head-quarters, where they held their meetings, and where new ones were admitted to the infernal mysteries; and it so happened that about two years afterwards I had occasion to go to the eastern slopes of the Cordilleras, which my friend had described as being the head-quarters of the witches.

'Bellisario,' I said to my companion on an afternoon's ride—a regular old *montanero*, dark, rough, and weather-beaten—"do you know of the place near here where the witches have their meetings?" Bellisario pulled the mule he was riding of a dead stop, gave a scared look round him, and said, 'No! For the love of Heaven, don't say the word here!'

It was just night-fall when we reached the cluster of two or three ranches, where we were to pass the night, built under some enormous overhanging rocks, down which poured a foaming torrent from the far-away glaciers above us. 'Ave Maria!' called my companion, in a loud voice, two or three times, to warn the inhabitants of our approach, as we pulled up about fifteen yards from the door. An old withered-up man—just the counterpart of my guide, only older and more grisly—came out, and, after answering, 'Ave Maria!' invited us to approach and to dismount. I went into the house, which contained three rooms, very clean, and furnished with care and even with taste. An old woman was sitting spinning guanaco wool when I went in, and a young girl was standing in the doorway of an inner room. She had a black shawl thrown over her shoulder.

dere, and drawn tight enough to show her graceful figure, and on her head was knotted a bright silk handkerchief. After talking for some little time, and taking the inevitable maté (South American tea), I begged to be excused while I went to look after my horse and my companion, who never put his nose inside the house.

'Bellisario, I can see there is some mystery about these people. Are they honest?'

He swore by everything that they were the most honest and most honourable in the world. I then said, 'Well, I shall ask them, if you won't tell me what the secret is. Perhaps they are witches?'

I said this quite by chance, but saw that I had touched the right chord. His face and manner changed, and he said in a piteous voice, 'Por el amor de Dios, señor, do not say that again. They are good people, but they would not like me to talk about them.'

I knew that I should get no more from him; and finding that he meant to pass the night at one of the little ranchos close by, where he had a 'Compadre,' or something of the sort, I wished him good-night, and returned to my hosts, and to supper.

There was nothing remarkable about the meal; and when it was finished coffee was placed on the table, in honour, as I felt certain, of the guest—myself. Presently the ladies of our party retired, leaving me smoking cigarettes with my ancient host. I made a few more remarks to him, but the conversation hung fire in a most tiresome way, and at last we came to a dead pause. I now thought I would ask my ancient friend if he could throw any light on the subject of witches. I turned to him as he sat apparently gazing intently at the few logs smouldering on the hearth, and said, 'Amigo, can you tell me anything about the meetings which the witches hold somewhere near here?'

He turned slowly round to me; but before he could answer me, I heard a crash in the next room, which made me jump off my chair.

'Nombre de Dios!' I exclaimed, 'what was that noise?'

'Nothing,' said my host; but he looked at me with an expression in his face which made me most heartily repent that I had ever asked him the question. His face, I thought, had undergone a sudden change; his eyes looked wild and red; all signs of decrepitude appeared to have departed.

'Do you really wish to know, or it is idle curiosity?' he asked me, in a tone very different from that in which he had spoken before.

My curiosity was intensely excited; so I answered, 'I do indeed wish to know. I have heard in the plains stories of the Cordillera, but no one could tell me anything worth knowing.'

'You are not afraid of the result?' he asked, with what sounded like a sneer in his voice.

'Certainly not!' I answered, with a laugh.

He seemed to think for a minute, during which he looked me over from head to foot with the deepest attention, and said, 'You don't know what you ask, but I will try you. Dare you follow me into the sierra to-night?'

I was somewhat taken aback at this proposal, but I loved an adventure of any sort, and immediately signified my consent.

'It is cold outside: you must have a glass of this before you go,' and he filled two small glasses with what looked like the spirit of the country, distilled from sugar-cane, but differently flavoured. He raised his glass, and said, 'Salud, señor,' and drained it; I followed his example, and said, 'It is extraordinarily good.' I might have said 'extraordinarily hot,' for it was like liquid fire.

'You are quite sure that you wish to come; that you come of your own perfect free-will?' he said, in a slow distinct voice.

'Quite sure,' I answered.

'You will promise to follow me closely, and to do exactly, as I tell you, asking no question?' he said again.

'I promise,' I replied.

'Good! Follow me.' And so saying he opened the door and went out. As we were leaving the house I heard the same crash in the inner room which I had heard when I first asked him the question about the witches, followed by a shout of laughter, so loud, so wild, so unearthly, that every drop of blood in me seemed to run cold. My companion turned to me, and laid his hand on my arm. He seemed to examine me intently. I did my utmost to look quite at my ease, but he said, 'Stop: you require more!' and he poured me out another glass of the spirit, which I drank off without hesitation or question.

It was very dark; but directly I began to walk my blood seemed on fire, and a light to be dancing before me, which proved plainly the strength of my host's schnapps. We at once turned round by the back of the rancho towards the rocks which I had seen on my arrival. We then went along by the side of the torrent, over a rough and broken path, so rough and so narrow that at times he gave me his hand to help me. I followed him in dead silence, and had been walking for, I should think, about twenty minutes, when the sound of the waters seemed to become much louder, and our path to be an abrupt descent. It was so dark that I could see nothing, and did not know where to put my feet. I felt the hand of my guide take mine, and draw me slowly along down this strange dark track. It was quite useless to think of retreating, even if I had wished it; but, strange as it seems, I felt no fear whatever, only intense curiosity to know what would happen next. I heard the sound of the torrent roaring overhead as it appeared, then an extraordinary rushing noise, which seemed all round me; and suddenly I felt myself seized by some irresistible force and whirled rapidly onwards and downwards. Then I heard crash upon crash, as though the whole of the rocks were being thrown down by some tremendous power, and shrieks of the same unearthly laughter which I had heard in the house. I was whirled round and round and over and over till I became insensible; and what happened to me then I cannot tell. When I came to myself I was sitting, or rather lying, on what felt like the loose dry sand on the floor of a cavern, and I was leaning against a rock.

There was a faint light in the place, and I tried very hard to collect my senses and discover my situation. I sat up, and could

see that I was in some rough natural cave, but the size of it I could not ascertain. The roof, and the greater part of the sides of it, were lost in impenetrable darkness, and it was only here and there that I could see the rough gloomy outline of some mass of rock. The light appeared to come from behind some dark rocks a little distance from me, and from what I imagined to be a larger cavern than the place where I now was. As I strained my ears to listen, I knew that there was something stirring out of my sight. First it was like the noise of muffled footsteps; then of voices very much hushed. I listened intently, and suddenly heard a shrill cry as of some one in the most extreme agony. Then again that extraordinary crash which I had heard before, and in a moment all was dead silence, and I was in utter darkness.

I remained for what seemed an age in this painful darkness. Then I heard a slight noise again, and to my intense relief I saw, once more, a flicker of light, which gradually increased to the same degree of brightness as before. Then I heard again the same muffled noises, the cause and source of which were still invisible. I put myself on my hands and knees, and crept towards the rocks, which were between me and the place whence the light proceeded. They were much further away than I had thought, but at last I reached them, and slowly and cautiously I raised my head over them. In an instant I heard crash upon crash, and there was a sudden flash of light which almost blinded me. This was followed by the wildest shrieks and shouts, and peals of extraordinary laughter. In a few moments the strangest sight met my eyes which the mind of man could conceive. Not the wildest imaginings of Retzsch's extraordinary pictures of the witches' Sabbath could approach what I now looked on. The dazzling light seemed to be everywhere, and to penetrate the enormous rocky vault. In front of me I saw the strangest groups of figures, men and women, but none of them old or ugly: my strange host of the evening, but looking younger, more active, more vigorous; he was standing by the figure of a beautiful girl, with his hand on her shoulder. The old woman I could not identify. If she was there, she was so changed as to be unrecognisable. Nor could I see the handsome girl who had so much attracted me. Presently, to my intense astonishment, I recognised the figure of the man who, two years before, had told me about this very place of the witches' meetings, and who had warned me against wishing to find out too much about it. He too was changed—youthful, handsome, vigorous, more like a young god of the old Greek mythology than the mortal I had known him; and as I watched more and more intently I seemed to recognise faces of both men and women which were familiar to me—faces which reminded me of far-away scenes in Europe, and days long passed by. These were all moving rapidly about, or standing in groups or couples. All were talking most earnestly, and gesticulating as though something intensely interesting was being discussed.

Suddenly I heard a sharp shrill cry, like some signal, and all was silence. Then began the softest and sweetest music. It seemed to float in the air all round me, and to penetrate all my senses with the most delightful, most intoxicating charm. Gradually it grew louder and louder: the strange forms in front of me began to move again slowly, and to a measured strain at first, then faster and faster, as the music grew faster and louder, and yet still faster and still louder, till my brain reeled with the extraordinary sight and the overpowering sound. The figures before me danced the wildest, the most extraordinary, the most fantastic dance, now in couples whirling with a speed which it took away my breath to watch, then joining hands in rings and circling round with lightness and grace. Faster and faster moved the dancers, louder and louder grew the music, till, once more the appalling crash was audible, and all was stillness and darkness.

I remained perfectly quiet, when suddenly I felt my hand clasped in that of some being of flesh and blood—not in the hard bony hand of my late guide to this extraordinary scene, but in a small soft hand of a young and, my imagination told me, a beautiful woman. There was nothing frightful, nothing that was not pleasant, in the touch of this soft little hand, and I allowed my fingers to close over it. Then I felt it gradually pulling me in the darkness. I tried to relax my hold of it; but softly and gently as I was held, it was as firmly as though in a vice of steel, and follow my captor I must whether I would or not.

I rose to my feet, and was led across the space which a few minutes before I had seen occupied by the strange dancers, and was taken what seemed to me an interminable distance in dead silence. I could hear the muffled sound of my own footsteps, but not one rustle or the slightest noise from my mysterious guide. Presently I found myself on a soft bed of some sort, a hand was placed upon my eyes, and in a moment I lost all sense of what was passing round me. How long I remained unconscious it was impossible for me to know; but I next remember finding myself lying on a soft luxurious couch, with a subdued rosy light round me. I raised myself up a little, and saw seated by my side a most beautiful woman. The softest and roundest of faces, and eyes shining with the most strange fire, but at the same time with an irresistible fascination. She placed her little white hand on my head, and I felt sure that it was the same small hand which had guided me there. Then she began to sing to me softly and sweetly in Spanish, but never had I heard that soft rich language so divinely uttered.

Suddenly the side of the chamber in which I was seemed to melt away, and I caught a glimpse of a magnificent banquet hall. Then slowly the wall appeared to close up again, and I was once more alone with my beautiful companion. Then again I heard these soft words and felt two beautiful arms thrown round my neck:

'These pleasures are yours, if you will love me. If you will join us, only say one word, and I am your love for ever, if you will. I never change, never fade; I grow more and more beautiful, and more and more loving as the sweet years roll by. Will you join us?'

Suddenly I heard the same shrill cry which had reached me be-

fore that evening, that cry of the most intense, most hopeless agony. I raised myself up with a start, and I saw a look of fury upon the beautiful face of my companion. Then as I gazed wildly round me to see where it came from, I distinctly perceived the form of the young girl who had been in the rancho that evening at supper, but how terribly changed and altered. Her clothes had been stripped from her, and she was bound to some object I could not see: but I can never forget the hopeless unutterable agony in her face.

'What does she there,' I asked, 'in this abode of happiness and delight?'

'She failed in her imitation,' answered my companion, with an expression of intense disgust.

'Must she always suffer like that?' I asked.

'Not unless she chooses,' she answered.

'But on what does it depend?' I asked again.

'Ask no more. You will not fail, as she has, in the beginning. Come,' she said, and once more grasped my hand in one of hers. She waved the other, and a mist seemed to cover the vision of the beautiful sufferer. Again I felt under the spell of my enchantress, and I seemed powerless to struggle any longer with my fate.

Softly she began to sing once more, and she chanted in the sweetest tones what sounded like an incantation. I felt my arm softly and firmly held in her little hands, and I saw her place a strangely-shaped instrument upon it, and in a moment the sharpest pain shot through me. I gave a sudden start, and at the same instant I heard again that fearful shriek from that wretched girl, and heard her cry, 'Oh! before it is too late, before it is too late, beware! beware!'

I started up, and with a violent effort threw off the grasp of my beautiful sorceress, and exclaimed, 'Never never! Leave me!'

I heard another fearful shriek. In a moment all was darkness.

My brain seemed to reel, and my senses failed me. I have only a confused recollection of what followed. Of moving with difficulty, of rough paths over rocks and briers, of the sound of foaming torrents, and of the fresh chilly night air; but nothing is distinct to me, nothing have I been able to make out; though I have often racked my brain to remember, it is a blank. It was a cold cheerless morning when I woke up on the bed in the room of my old host at the rancho. There was a driving rain and a bitter wind. I was lying there in my clothes, with a poucho of guanaco wool thrown over me, and as I tried to raise myself up I felt stiff and bruised, weary and sore all over. My clothes were damp, and my feet wet and soiled. It was some time before I could collect my senses and remember any of the extraordinary events of the night; and as I was sitting up in the bed trying to do so I was disturbed by old Bellisario coming to the door with his 'Buenos Dias, señor,' and telling me that my horse was ready and we had a long road before us. At the same moment the old woman, wife, or whatever she was, of my host, brought me a mat, which I sat on the side of the bed and sucked. She said nothing. Presently I asked her how her fair granddaughter was, and she answered in a short, and I thought very cross voice, that she was not well, and could not get up.

'Where was my host?'

He had gone out at daylight, nearly an hour ago. Bellisario again appeared at the door, evidently very impatient, so I rose from the bed and performed my toilet, which consisted of a shave, put my head through my large heavy poncho, gave the old lady my blessing, and mounted my horse in the bitter rain and wind. We rode on in silence for some time, and then I tried to ask my guide about the old inhabitants of the rancho and their youthful relation. He was not willing to be very communicative, but as we got further away he opened a little more, and told me that they were strange people who had settled there. I asked him if he liked the place and would come back with me there again; but he shook his head and said it was a place of bad name, and that there had been an awful storm in the night, and he could not sleep for the noise it made. All this time my arm had been hurting me in the strangest way, and I rolled up my sleeve to examine it; and there, to my astonishment and horror, I saw distinctly marked on it a small deep red diamond, with a strange hieroglyphic in the centre of it. That mark I bear to this day.

I never went back to the rancho, or heard any more of the old couple and the beautiful young girl; and my strange adventure has cured me of wishing to find out more about witches, either in Europe or in the mountain caverns of the Cordilleras.—*Time*.

### A STRANGE DICTIONARY.

Travellers come upon curious vocabularies in foreign parts. We recently met in Cairo with what professed to be a list of colloquial Arabic words for tourists, in which neither "donkey" nor "donkey boy" occurred. And in every Continental hotel queerly translated *menus* hang on the walls. Such was the famous *carte* at Dieppe in which "Soupe à la reine" was given as "Soup at the Queen," and "sauce piquante" as "the sharp sauce." Not long ago one could read in a Greek inn of "excursions for theater-boxes and tickets for complaints"; and be told that "the director is responsible only for such values that have been deposited at his office." In another place a notice is hung in the porter's glass case to say that here "informations shall be given." In Italy we have read of a mysterious, but evidently very intoxicating, drink called "whisky-dish," and have been advertised of the existence of "whisky-cold baths." Still more amusing are lists of words which by grammatical uniformity ought to be in our vocabulary, but which the stupidity or obstinacy of our forefathers led them to reject. There is a little poem, quoted, if we do not mistake, by Mr. Marchant in a book on *Hebraisms*, which offers us an example, in expressing the feelings of an ardent lover, of the beautiful unison and consistency of our language, "and which, until we had the good fortune to meet

with a German dictionary which has had a large Continental circulation, we thought unrivalled. One verse must suffice here:—

Let my longings not sink,

I would die if they sunk!

Oh, I ask you to think

As you never have thunk

And our fortunes and lives let us link as no lives could be lunk.

But for a long series of such solecisms, for a persistent, unwavering statement of what the English language may be in the mind of a foreigner, a little volume we recently met, which is already in its sixth stereotype edition, and therefore is not only presumably very popular, but carefully revised, exceeds everything except the English names in Paul Hentzner. No dictionary can be above criticism. More than any other kind of book, it is subject to be marked by the peculiar views of the compiler, whether in the transliteration of extraneous words or in the definition of simple ideas. Dr. Johnson was sometimes in a difficulty, and to explain such a word as "net" he postponed the question, and called it "a series of reticulations"; which is no better than the definition of another lexicographer, whose name has not been preserved, and who called a net "a lot of square holes tied together by a string." But a dictionary like Johnson's is one thing; a dictionary of translated words is another. One of the best examples of what this kind of work should be is of course Mr. Bellow's French Dictionary; and assuredly one of the worst is the German book referred to above.

We have long wondered why it is that the Germans have almost a monopoly of these curiosities of literature. So many Germans are acquainted more or less intimately with English that the number and daring of such translations are remarkable. German is a language by no means very remote from English. The exact equivalents of thousands of words are easily found; and, even in the matter of pronunciation, the German's frequent failure to speak good English may be accounted for on the principle that the two tongues are sufficiently near each other for him to be able to pronounce English with a German accent. French is written so differently from its spoken sound that the learner must speak by ear, not by sight; and French is, with the single exception of Arabic, the easiest modern language to speak, and speak badly. It is not difficult to understand why a Frenchman cannot pronounce English or German double consonants; nor is it odd that a Teutonic learner cannot make much distinction between the ten or a dozen different words which to his ears sound alike, as *ean, au, aux, oh, hant, &c.* But the German's tendency in speaking, and still more in writing, English is not of this kind. He is troubled rather by the ghosts of words which should exist but do not. We occasionally use "aberration," but never "aberr." We often use the form "abject," but never "abjectedness." We think a law may be abrogated, but do not characterize it as "abrogable." So, too, the law-breaker may abscond, but we are careful not to talk of his "absconson." Neither do we say that he ever "nibid" anywhere, that misfortune has "betid" him, or that he "wox" incautious, and was therefore "undid," and was eventually hard "hot." Perhaps we ought, by grammatical laws rigidly applied, to be the happy possessors of such forms as these. That we are not may be our misfortune: the editor—Herr Wesely—of Tauchnitz's "Pocket Dictionary of the English and German Languages" (Leipzig, 1876) evidently thinks it our fault, and uncompromisingly teaches us our own tongue as it ought to be, in his opinion at least. The most purely original portion of Herr Wesely's work is the "Table of the Irregular Verbs"; it has apparently been evolved by a mental process peculiar to the High German idiosyncrasy, and is valuable as affording a knowledge, not only of the words used above, but of many other words of a similar construction and equally delicate shades of meaning.

Under the letter "A" alone in the body of the Dictionary we have column after column taken up with such useful words as *abalienate, abapitze, aberr, aberring, abenthian and abenthiated, abist, absorbtion, abstringe, accommodableness, accommodateness, acquirable, and aggroup*—words which may perhaps be conceived to exist, but which few English ears ever heard. Besides these, there is an equally extensive class to which it is difficult or impossible to assign any definite meaning. They may be found useful to some future Gulliver or Alice. But what can be made of *abature, abited, abstrude, abeume, acclive, or accotide*? It is not very difficult to "abnodate" the puzzle offered by *amusive, or angulous*, but a man might be "appoplexed" before he could guess the derivation or object of *aggogled, or antiguggler*. There are many words, too, which are absolutely unknown to the English of this generation. They do not call up the slightest echo of sense in our ears. *Agio* and *agiotage* may just pass muster, but what shall we say of *achor, alust, aubin, and aam*? This last is, we are told, a substantive, and the equivalent of the German "ohm." Chestexplorer is, it seems, the English for stethoscope. Under the important and often-used expression *Chickabiddy* we are desired to "see biddy." Biddy is explained as "Hühnchen." There is no mention of *Bridget*, even in the supplementary "Collection of the most usual Christian Names and the most remarkable Geographical Names." This part of the work should have been called a "Collection of the most remarkable Christian Names and the most usual Geographical Names." Ead, we read, is the English form of Ida. Alcairo is the English for Cairo. Bob or Bobby is the usual English pronunciation of Robert. We write the German Charlotte as *Charlot*, and *Cæcilie* as *Ciss*. Conny is our equivalent for "Constantin." Denis for Dionysius. Frat stands with us for Euphrat, and Gill for Gulchen. We write Guiny for Guinea and Gui for Guido. Guy is not mentioned. Mawd is our form of Mathilde, and Mawdin of Magdalene, while Mawdlin stands in English for Lenchen.

From the quantity of mere pot-house slang included in the Pocket Dictionary we might conclude that Herr Wesely is either an innkeeper himself, or has been specially honoxed by some English "chapman," who favoured him with the meaning of such words as

awk, collop, chump, and "big-wig," which last is rendered into German as "ein consequenter mumm." Besides "chapmanry," which is translated by "kundschaft," there are many expressions relating to trade, and, strangely enough, to cheesemaking, cider-pressing, and similar country employments. The obsolete words may be accounted for by supposing that Herr Wessely has been studying the tavern scenes in Ben-Jonson and the early English dramatists: but where did he find "arrival-book" and "call-horn"? The compound words, indeed, are of startling length and complication. Some of them are of everyday use, and will be most valuable to Germans visiting England and anxious to study our domestic institutions. They will not be long on our shores without hearing "actionthreatener," "aim-sight," and "apronstringhold," especially the last. But they may go further afield before they meet with apronman, alightboard, airymotions, atiptoe, bakemeats, havin, belletrist, biland (a peninsula), bilander, brineprover, cabbageturnip. Perhaps these combinations are common in certain country districts, but Herr Wessely's pupils may search in vain in the dictionary for such a word as cheesecake, while they will hardly succeed in obtaining roast beef if they ask for it as "carbonade." Even when he gives old English words he mistranslates them. Thus he has "cadger," and explains it by "ein bäuerischer Mensch." The word should be "cadger," and should be explained by "pedlar," with perhaps a reference to its origin in days of falconry when the man who bore the "cadge" or cage on which the hawks were perched was known as the cadger. Hawker, an ordinary English term for a travelling merchant or "colporteur," has a similar origin and is correctly given by Herr Wessely. "Aitling" is a romp or a tomboy. Edulcorate is translated by *ausaiten*, but the latter expression is not given among the German words, and edulcorate remains a puzzle. Under "by" we have bygone, bylane, bylaw, byname, byspeech, bystander, byway, byword, but not byplay or bypath. Croo is given as an English word, and is translated by *gurren*; but *gurren*, again, is not to be found in the German list. In fact, the number of such omissions is one of the most singular features of this remarkable work. We have such obsolete or unused terms as catercousin, candlebomb, cubature, crummy, chitterling, bruske, brustling, burgess-ship, aboard, abroad, apeak, aslope, awaft, atilt, asquint, and many similar and unfamiliar combinations. What is abb? It is translated by *recherzettel*, a weaver's shuttle, and may be a common technical term in some places, and so are boss in the sense of master, and abernethy in the sense of biscuit; but we did not expect to find either in a dictionary. Any more than abecedarian, abece (an alphabet), smithcry, slabby, pituitous, meslin, looby, lungsick, or Loyds (*air*), which is translated *Schiffersicherungsverein*, as if we were in the habit of calling all insurance offices of the kind by the one name. But it would be impossible to open a page of the volume without discovering such forms, and we may heartily recommend the book as a source of unending and inexhaustible amusement to the weather-bound traveller within reach of a copy. Even if it "snew" (p. 223), he might not be sorry to have "pight" his tent in such a place, nor will he have "dempt" his labour lost when he has "lough" over Herr Wessely's very "Irregular Verbs."—*Saturday Review*.

## METEOROLOGICAL REPORT

FOR WEEK BEGINNING FRIDAY, MAY 14TH, 1880.

Observatory of Daigaku, Moto-Fujicho, Hongō, Tokio, Japan.

## REMARKS.

Heavy line represents barometer.

Light continuous line—max. &amp; min. thermometers.

Dotted line—represents velocity of wind

.....percentage of humidity

Max. velocity of wind 24 miles per hour on Saturday, at 3 a.m.

The barometer is reduced to the freezing point and to the level of the sea.

The highest reading of the barometer for the week was 30.208 inches on Wednesday at 7 a.m. and the lowest was 29.736 inches on Friday at 2 p.m. The maximum temperature for the week was 75° being only four-tenths of a degree lower than the corresponding week of last year. The minimum temperature was 50° 3, being four or five degrees lower than for the same week of last year. The total amount of rain was 2.80 inches, that for the corresponding week of last year being 1.759 inches.

## SHIPPING INTELLIGENCE.

## INWARDS.

May 16, American 3-masted schooner *Laura R. Burnham*, Kelly, 673, from Harret Iulet, Lumber, to E. B. Watson.  
 May 16, British steamer *Oceanic*, Metcalf, 2,440, from Hongkong, Mails and General, to O. & O. Co.  
 May 17, Japanese steamer *Tokai Maru*, Hogg, 1,042, from Kobe, Mails and General, to M. B. Co.  
 May 17, Japanese steamer *Tamara Maru*, Carrew, 538, from Hakodate, Mails and General, to M. B. Co.  
 May 17, British steamer *Radnorshire*, Davis, 1,201, from Kobe, General, to Adamson, Bell & Co.  
 May 17, British steamer *Glenfalloch*, Parkes, 1,460, from Hongkong, General, to Jardine, Matheson & Co.  
 May 18, French steamer *Volga*, Guiraud, 1,502, from Hongkong, Mails and General, to M. M. Co.  
 May 18, German barque *Talce*, Stolze, 342, from Takao, Sugar, to Chinese.  
 May 20, Japanese steamer *Genkai Maru*, Conner, 1,260, from Shanghai and ports, Mails and General, to M. B. Co.  
 May 20, British steamer *Guy Mannering*, Mann, 1,300, from London via China ports, General, to Hudson & Co.  
 May 20, Japanese steamer *Togakima Maru*, Hubbard, 946, from Kobe, Mails and General, to M. B. Co.

May 20, American Otter Hunting schooner *Stella*, Werner, 50, from Shanghai via Bonin Islands, to Captain.

## PASSENGERS.

Per British steamer *Oceanic* from Hongkong:—Commodore Smith, R.N., E. Beart, Mrs. Gordon and servant, and Mr. J. Sharp in cabin; and 1 European in steerage for Yokohama, and Captain H. G. Thomsett, R.N., Captain H. Geary, R.A., Mr. and Mrs. Thomas, Messrs. R. H. Sandeman, E. C. Ray, and Liddell and servant in cabin; and 4 European and 692 Chinese in steerage for San Francisco.

Per British steamer *Radnorshire* from Kobe:—200 Japanese in steerage.

Per French steamer *Volga* from Hongkong:—Mrs. Fitzgerald, Mr. and Mrs. Putzier and Messrs. Sugira, Dolring and Helm.

Per Japanese steamer *Genkai Maru* from Shanghai and ports:—Dr. and Mrs. Martin, Rev. and Mrs. Lambuth, Mrs. Wheeler and 2 children, Mrs. S. Bryau, Mrs. Quentin Hogg, Mrs. H. L. Parmelee, Miss J. Wilson, Miss D. Clark, Miss H. E. Fielding, Messrs. Marintur, J. Belknap, W. H. Poate, H. W. Martin, S. Eady, W. Hagart, Dr. Balster, Dr. Bridges, M. Colima, Loet, Gen. Miyoshi, Capt. Agan, Messrs. Wong, Sowze, Naoye and Wife, Fukugawa, Mayekawa, Robuyekawa, Nitta, Noda, Joshiakawa, Sone, Oyawa, Hisano, Nakasima, Lu Lu Pow, Miura and Mrs. Angan in cabin; 2 Europeans, 333 Japanese and 10 Chinese in steerage.

## OUTWARDS.

May 15, Japanese steamer *Kotonoge Maru*, Dithlefen, 1,133, for Hakodate, Mails and General, despatched by M. B. Co.  
 May 15, British steamer *Sunbeam*, Dobson, 1,154, for Hiogo and Nagasaki, General, despatched by L. Kniffier & Co.  
 May 16, Japanese steamer *Takachika Maru*, Nye, 1,407, for Niigata, Mails and General, despatched by M. B. Co.  
 May 17, Japanese steamer *Sharin Maru*, Kilgour, 800, for Kobe, Mails and General, despatched by M. B. Co.  
 May 17, German barque *Oscar Moyer*, Roder, 360, for Newchwang, Ballast, despatched by H. Giranert.  
 May 17, British barque *Charwood*, Hiscocks, 837, for Kobe, General despatched by Hudson & Co.  
 May 17, American barque, *Harvard*, Prey, 1,033, for Philippines, Ballast, despatched by Cornes & Co.  
 May 24, Japanese steamer *Hiogo Maru*, Moore, 896 for Hakodate, Mails and General, despatched by M. B. Co.  
 May 19, German barque *Tekli*, Petersen, 350, for Newchwang, despatched by Chinese.  
 May 19, Japanese steamer *Takasago Maru*, Young, 1,230, for Shanghai and ports, Mails and General, despatched by M. B. Co.  
 May 20, British steamer *Sunda*, Reeves, 1,029, for Hongkong, Mails and General, despatched by P. & O. Co.  
 May 20, Japanese steamer *Tokai Maru*, Hogg, 652, for Kobe, Mails and General, despatched by M. B. Co.  
 May 22, British steamer *Harter*, Branthwaite, 1,196, for Kobe, despatched by Smith, Baker & Co.  
 May 22, American 3-masted schooner *Laura R. Burnham*, Kelley, 675, for Shanghai, despatched by E. B. Watson.  
 May 22, British barque *Oceanic*, Frits, 320, for Nagasaki, despatched by H. MacArthur.  
 May 22, American ship *Lennox*, Peterson, 1,491 for Hongkong.

Treasure	...	...	\$ 450.00
----------	-----	-----	-----------

Per Japanese steamer *Genkai Maru* from Shanghai and ports:—

Treasure	...	...	\$30,000.00
"	...	...	Silver Yen 3,400.00

## REPORTS.

The French mail steamer *Volga* reports: Left Hongkong on the 11th of May at 6 o'clock in the morning and arrived in Yokohama on the 17th, at 8 o'clock in the evening.

The British steamer *Guy Mannering* reports: Left Shanghai on the 16th of May, arrived at Yokohama at 6.30, 20th May. Experienced first part of passage fine weather; latter part equally with much lightning. Yesterday afternoon off Cape Idzu exchanged signals with the British barque *Pym*, of Sunderland, the long looked for vessel.

## COMMERCIAL INTELLIGENCE.

**IMPORTS.**—The course of business drags wearily along. *Farm* is weak, some few small lots, both English and Indian, moving off slowly at about former rates. *Shirtings*,—a few parcels of good 9 lbs. have been sold, but beyond this nothing has been done. *Fancy and Printed Cottons* are almost neglected. *Mousselines* the turn dearer.

**COTTON YARNS:—**

Nos. 16 to 24 Common to Medium ... per picul	\$29.00 to 31.50
" " Good to Best ... "	\$32.00 to 34.00
Bombay, No. 20 Do. ... "	\$29.00 to 30.50

Japan Rice ... "	\$2.70 to \$2.90
Kerosene Oil ... case	\$1.60
Newchwang Pens ... picul	\$2.20

**EXPORTS.**

**SILK.**—There is no change to note in our silk market. The reports of the progress of the new crop both from China, Europe and from the interior of this country are so far favourable, and under the circumstances all prefer to remain inactive and await the course of events. Business is at a standstill, the sales of the week only amount to about 50 shipping bales, and prices are almost entirely nominal.

Stock about 2,200 Japanese bales.

Total shipments to date 17,601 bales against 18,278 bales at the same period last season.

	In London at 3/10½ per lb.	In Lyons at fr. 4.98 per kilo.		In London at 3/10½ per lb.	In Lyons at fr. 4.98 per kilo.

MATSUZAKA HOTEL,  
KIGA,  
(Hakone Hot Springs.)

Yokohama, July 19, 1879.

## W. & A. GILBEY'S WINES AND SPIRITS.

W. & A. GILBEY have special facilities for carrying  
on an extensive Foreign Trade, having held for  
many years in their Excise Bonded Stores, for the purpose  
of their Home Trade, a stock of not less than 12,000  
Casks of Wines and Spirits, which are equally  
available for Export. These stores are by far the largest  
private Duty Free Warehouses in the World, and are under  
the supervision of a staff of Excise Officers specially at-  
tached to these Warehouses.  
THE EXTENT of W. & A. Gilbey's purchases enables them  
to give the best VALUE to the public, as a twentieth part of  
the Foreign Wines consumed in the United Kingdom is  
supplied from their stock. In the year 1876 W. & A.  
Gilbey paid duty on 1,881,049 gallons of Wines and Spirits,  
and the average quantity bottled and sent out by them  
daily was 3,050 dozens or 36,600 bottles.

QUALITY is guaranteed by W. & A. Gilbey, and is the same  
whether the Wines or Spirits are obtained direct from their  
Head Establishments or from any of their Agents. The  
purity and genuineness of every article in this list are  
guaranteed in accordance with Act of Parliament, 38 and  
39 Vict., Cap. 63.

W. & A. Gilbey have always adhered to the standard of  
Bottle Measure recently recognised by the Government,  
namely—

6 bottles contain one gallon; 12 half-bottles contain  
one gallon.

SECURITY is ensured to the purchaser, each bottle bearing  
W. & A. Gilbey's seal and label guaranteeing quality and  
measure, and the strength also in the case of Spirits.

EDWARD FISCHER & Co.,  
Agents for Japan.

**KEATING'S INSECT POWDER,**

which is quite harmless to Domestic Animals.

In exterminating Beetles the success of this Powder is extraordinary, and no one need be troubled by those pests. It is perfectly clean in application.

Ask for and be sure to obtain "KEATING'S POWDER," as Imitations are Noxious, and fail in giving satisfaction.

SOLD BY ALL CHEMISTS IN BOTTLES, 1/- & 2/6 each.

**KEATING'S WORM TABLETS,**

A PURELY VEGETABLE SWEETMEAT, both in appearance and taste, furnishing a most agreeable method of administering the only certain remedy for **INTESTINAL** or **THREAD WORMS**. It is a perfectly safe and mild preparation, and is especially adapted for Children.

## TESTIMONIAL.

Medical Hall, Gildersome, Nov. 28th, 1876.

MR. KEATING,

Dear Sir,—I think it nothing but my duty to inform you of the immense sale I have for your Worm Tablets, which I may justly say is enormous, and in every case gives the greatest satisfaction. I have now in stock two bottles containing the Round Worms brought me during the last few days by customers, one Worm 40 yards long. I dare not be without the remedy.—Yours respectfully,

M. A. WALKER.

SOLD IN BOTTLES, BY ALL CHEMISTS AND DRUGGISTS.

Proprietor—**THOMAS KEATING, London.**

**REWARD AND CAUTION.**—Whereas fraudulent imitations of this unsurpassed remedy have been sold, I hereby request anyone knowing of the vendor of the same to communicate with me, on conviction of the offender a liberal reward will be paid.

April, 1880.

**SCOTTISH IMPERIAL INSURANCE COMPANY.**

**FIRE** Insurance granted, upon desirable buildings and their contents, in **TOKIO**.

**The "Japan Mail,"**

A Daily, Weekly, and Fortnightly Journal,

ESTABLISHED, 1865.

## TERMS OF SUBSCRIPTION.

WEEKLY EDITION. The "Japan Weekly Mail," a Weekly Review of Japanese Commerce, Politics, Literature and Art.—Per annum, \$24; Six months, \$13; Three months, \$7.

FORTNIGHTLY Edition, being a Summary of the foregoing, is published for transmission by the American Mail Steamers via San Francisco. Per annum, \$12; Six month, \$7; Three months, \$4.

THE JAPAN DAILY MAIL is published every morning (Sundays excepted) and contains the Arrivals and Departures of all Shipping, Passenger Lists, Cargoes, Vessels on the Berth and in Harbour &c. &c. Also the latest Telegrams, Japanese news, Reports of Trials in the Courts of Law, Meetings of public bodies, and all matters of interest to the Community. Special attention is called to this Journal as a medium for circulating local advertisements. It has a large and constantly increasing circulation, its low price bringing it within the means of all classes of the community. It therefore affords exceptional advertising advantages, and secures to all announcements the utmost publicity, the object aimed at by advertisers.

SUBSCRIPTION PER MONTH—ONE DOLLAR.

## THE UNITED STATES AND THE SHIMONOSEKI INDEMNITY FUND.

THE refund of the original share, received by the United States, of the pecuniary indemnity paid by Japan, together with subsequent accumulations from its investment, has long been seriously desired and insisted upon by the best American statesmen. It appears, now, that there is at last, as the *New York Times* says, "some prospect of justice being done." The House Committee on Foreign Affairs has agreed to ask "that the Government shall return to Japan the sum exacted as indemnity for firing upon American vessels from the Shimonoseki forts, in 1863, with interest, having first deducted the sum of 125,000 dollars, which is to be distributed as prize-money among the officers and crew of the United States man-of-war *Wyoming*. The Japanese Government originally paid to the United States the sum of 785,000 dollars, gold, which was invested in United States bonds by the late Mr. W. H. Seward, then Secretary of State, and was so judiciously managed that it now amounts to more than 2,000,000 dollars. The original exaction of this sum was regarded by all right-minded Americans as a piece of extortion to which our Minister in Japan was an unwilling party. There was no reason why we should have accepted this large sum of money from Japan, except that other nations had taken it; and it should be recorded, to the everlasting credit of our people, that, while the Governments of Great Britain, France, and Holland calmly pocketed the spoil taken from Japan by way of indemnity, American citizens have never ceased to complain that our share of this robbery has long been retained in the custody of the United States Government." The writer goes on to say that, so far as the world knows, there has never been any motion in Great Britain, France, or Hol-

land towards returning any portion of the loot. He then recapitulates the circumstances which gave rise to the claim for the indemnity, which he denounces as an extortion, and even justifies the action of the Choshu Daimio in firing upon a foreign ship. "The damage inflicted upon the American merchant vessel was inappreciable. The loss sustained by the man-of-war *Wyoming*, during the subsequent attack of the allies, could not have been more than a few thousand dollars. Yet, we took our share of the indemnity paid by Japan, amounting to \$785,000. However this transaction may be disguised, it was downright robbery. The only claim which the British Government had to participation in the expeditionary proceedings was that the British naval force in Japanese waters was strong, while the forces of other Western Powers were not strong. Lending its aid to the Governments of Holland, France, and the United States, Great Britain became a full partner with these in the subsequent robbery of \$3,000,000, our share of which is it now proposed to return to Japan. The vessels first fired upon had no business to be found in the Straits of Shimonoseki. To all intents and purposes, it was an inland channel, and repeated warnings had been given of its being closed to foreign commerce. The excursion of the *Wyoming* was undertaken with full knowledge of the relations which existed between the Prince of Choshu and the Imperial Government, as well as of the hostile intentions of his feudal chieftain. But, all other considerations apart, it must be conceded that the indemnity exacted was grossly out of proportion to the amount of real damage sustained by our vessels."

To this article in the *New York Times*, Mr. W. G. Howell, formerly editor of this journal, has replied in a letter to the *London Globe*. His arguments are those of everyone who defends the Shimonoseki expedition and the fine imposed upon the Central Government of Japan, and his statement of the relative claims of the powers concerned to shares of the spoil is exact. But he repeats a misstatement which has been so often made as to have given rise to a popular fallacy which is a grievous injustice to the then United States Minister in Paris. He writes:—"It is no source of reproach to the United States that they had no naval force in the Japanese waters; but, as a matter of fact, they had none, and took the only means at their disposal of showing their concurrence with the course pursued by the other Treaty Powers. Though some of the Powers concerned were anxious that the money should be paid according to the covenant, England was more anxious for some commercial equivalent, particularly the early opening to trade of the port of Hiogo and the city of Osaka. The Japanese, however, did not see their way to this, and after nature deliberation elected to pay the money. . . . At the division the United States Minister in Paris, where the matter was being discussed for convenience sake, contended that, as the general co-operation of all the four

Powers must necessarily have had great and equal weight, if not in the operations, at all events in the measures which preceded them and afterwards in turning the results to good account, it would be fair to look upon the several Powers as contributing in an equal degree to the success of the common cause, and therefore as entitled to share equally in the indemnity which the Japanese Government agreed to pay. This view was accepted, France benefiting by it more than under the principle suggested by her own Minister, while Holland, and the United States especially, derived even still larger advantage from it. England alone was required to make a sacrifice, but she did so—I venture to think with equal dignity and grace. . . . It is not too much to say that the "smartness" of the principle of division suggested by the American Minister, and conceded by the other Powers, greatly shocked very many excellent American citizens. They felt that they had little or no business with the money, and to do them full justice they have never since been comfortable about it." Now, as a matter of fact, the United States representative did not act in the manner ascribed to him by Mr. Howell, and in general belief. He simply accepted what was a deliberate, and as he characterises it, liberal, proposal of the British Government. Great Britain had certainly borne the heaviest portion of the expense and peril of the expedition, whether it were warranted or unjustifiable. "She contributed nine ships of war, France four or five, the Netherlands three, and the United States a small chartered trading steamer, manned with a lieutenant's party, and carrying one gun." When it appeared inevitable that the money indemnity, failing a commercial concession, must be accepted, she repudiated the notion of its division in proportion to the respective forces employed by the allies, and determined that the partition should be equal. In the United States diplomatic correspondence Vol. 1, 1866-7, pp. 273-4, we find a despatch dated Paris, January 19, 1866, to the Honorable William H. Seward at Washington. His Excellency Mr. John Bigelow, referring to a communication received in the previous month at his Legation from the British Embassy in the same capital, transmits a verbal note from Mr. Drouyn de Lhuys, advising him of "what appears to be a very satisfactory settlement of all the questions growing out of the Convention signed at Yokohama, on the 22nd of October, 1864." After mention of the final arrangement concluded by the representatives of the treaty powers with Japan for the payment of the whole indemnity, a modification of the tariffs and new guarantees for the opening of Hiogo, the envoy remarks:—"By the same note I was advised of the proposal of the British Cabinet to divide the indemnity fund equally between all the powers. The liberality of this proposal places the United States under greater obligations than any of the other treaty powers inasmuch as our equitable proportion of it was, I believe, the smallest." There is evidence enough here to show the injustice of the accusation made against the representative of the United States to the effect that he claimed for his nation an equal share of the compensation with the other combatants. He says, indeed, "I did not hesitate to embrace this proposal, subject only to the conditions by which my power was limited." There is a vast deal of difference, however, between promptly accepting a liberal gift, and clamoring for it. We fail to see how Mr. Bigelow could have gracefully acted otherwise than he did; and there is no "smartness" in his compliance. "France," he adds, "accepts these propositions" (the one referred to and others regarding the mode of deposit of the instalments) "and Holland undoubtedly soon will do so, if she has not already." It appears from the verbal note of Mr. Drouyn de Lhuys that

the American representative was not even the first to acquiesce in the measure. "The British Cabinet appearing to be more in favour of an equal division of the indemnity among the four powers, the Government of the (French) Emperor makes no difficulty in adopting this plan, and is ready, should this system of division be adopted also by the Government of the United States, to &c." Again, "The Minister of the United States is also advised that the English Cabinet had proposed that the covenanted indemnity . . . should be equally divided."

At the same time as the authority we have quoted exonerates the American Minister in Paris, at the time of the adjustment of the Shimonoseki indemnity, from any blame that might be held to accrue from an open demand for an equal partition, it also effectually disposes of the proposition which has once or twice been formulated in this neighbourhood that, if a refund of the money or any part of it is to be made, it should revert to England. Granting that that power was put from the very first, "to far heavier expense than her share of the indemnity covered," granting that "she was, pecuniarily, a heavy loser by the adopted principle of partition," yet that principle having been adopted at her suggestion, she at least has no lien upon a fund with the first nucleus of which she joyfully parted. Happily the notion that she would make any effort to obtain it, or would do aught but most indignantly reject it if proffered, could never be seriously entertained. At least the whole of the sum remaining, after payment of the expenses incurred by the American Government, and what may be deemed a fair reward to its men who were engaged in the struggle:—the entire sum remaining, with its accretions, should be returned to Japan, to whom it belongs.

#### THE METEOROLOGY OF TOKIO, FOR THE YEAR 1879.

IN each number of this review issued during the past year and a half, will be found a meteorological chart and report based upon observations made at the meteorological observatory established by the University of Tokio and located in Hongo Moto-Fujimicho, Tokio.

The first annual report from this meteorological station has recently made its appearance\*; and from its pages we shall select such facts and conclusions as would seem to be of interest to the general public.

A considerable portion of the volume is occupied by charts and diagrams in which the fluctuations of the various meteorological elements are represented by well-known graphical methods. One of the most valuable of these is the first series of six charts showing the height of the barometer for each of the three observations for every day in the year. An examination of these charts and of the tables which accompany them will reveal many things of interest concerning the movements of the barometer during the year.

It appears that January was the month of highest barometric mean, and that in August the mean was the lowest. The highest point reached during the year, however, was recorded at 10 p.m. on the 21st of April, being 80.515 inches. The lowest point reached was 29.087 inches at 7 a.m. on the 23rd of February, the total range for the year being thus 1.428 inches. The mean height for February was great, being, in fact, only inferior to that of

\* Report on the Meteorology of Tokio, for the year 1879, by T. O. Mendenhall, Professor of Experimental Physics, University of Tokio: Published by the University.

January, and hence February shows the greatest monthly range for the year, the amount being 1.318 inches, although the mean barometer was remarkably steady for that month, the whole range being only .339 inches. The mean barometer for the whole year was 29.952 inches, and this number differs by only one thousandth of an inch from the mean for the month of March.

But more general interest is felt in the results of thermometric observations than in those of the barometer. While it would undoubtedly be of greater value and interest if we could present a series of tables and charts of the temperatures to which we shall be subjected during the present season, yet an examination of those published concerning the temperatures through which we passed during the year 1879, cannot fail to possess some attraction for many of us.

The observations were taken by means of thermometers graduated in degrees Fahrenheit, and the mean temperature for the whole year was found to be 58°5. The coldest days of the year, or rather the days on which the lowest temperature was reached, were January the 2nd and January the 7th. On both these days the minimum temperature was 24°1.

The maximum temperature for the year was reached on the 15th of August, being 93°. During the whole month of August the temperature did not go below 69°4 and the mean for the month was 80°2, which was the highest monthly mean for the year. The lowest monthly mean was for January, being 37°7.

There is great fluctuation in the daily range of the thermometer in this country, as everybody has long ago discovered without instrumental aid. In this respect August seems to possess more constancy than any other month, and March the least. At all events the evidence of the year 1879 points strongly in that direction. For August the greatest daily range of temperature was 17°1 and the least was 11°2. In March, however, the greatest range was 29°8 on the 28rd, and the least was 8° on the 6th, and these are respectively the maximum and minimum daily range for the year.

The temperature fell to the freezing point or below as follows:—

In January .....	on 27 days.
„ February .....	„ 18 „
„ November .....	„ 1 „
„ December .....	„ 5 „

making a total for the year of 46 days. A temperature of 90° or higher was reached,

In July.....	on 7 days.
„ August.....	„ 5 „

or on 12 days in the entire year. When it is remembered that the highest temperature for the year was 93° which was reached on only one day, it will not be doubted that the degrees of heat reached in this locality are much lower than those common in the same and considerably higher latitudes in other parts of the world. At the same time it cannot be denied that the heated term is one which is decidedly oppressive. Unquestionably the high degree of humidity of the air here causes more unpleasant feelings during the hot season than would be experienced in many localities where the actual temperature is considerably higher, but the amount of moisture present very much less.

In the discussion of the observations upon the velocity and direction of the wind some facts of interest appear. The total movement of the air in all directions during the year was 49,890.6 miles, being at the average rate of 135.8 miles per day, or about 5.6 miles per hour. Taking into consideration the various directions in which this movement took place, a "resultant movement is exhibited

in one of the charts, showing a total displacement of 11,000 miles from a point 27° west of north." The greatest motion of the air during any single day of the year took place on December the 26th, the total number of miles being 597.7, or a trifle less than an average of 25 miles per hour for the entire 24 hours. It was on this day that the extensive conflagration in the city of Tokio occurred, and for which the high wind must largely stand responsible. The maximum velocity for the year was reached during that day, being about 47 miles per hour. The day on which there was the least motion of the air was May 31st, the total number of miles for that day being 21.5 or almost exactly an average of 1 mile per hour. There was less wind in June than in any other month, and the maximum amount, for a single month, occurred in March. A series of charts, exhibiting at once the prevailing direction and the velocity of the wind, establishes beyond question that the great majority of winds came from the north and north-west, and this is especially true of high winds, of which separate charts are given. Winds of a velocity of 20 miles per hour and over are recorded on forty different days during the year. Very much less wind came from the south-west than from any other direction.

Another meteorological element of great interest is the rainfall. From the observations it appears that the total rainfall for the year was 58.975 inches.

Of this, 18.409 inches fell in May and June, the greatest amount for any one month being 9.606 inches in the month of June. On June the 4th was the maximum fall for any one day in the year, the amount being 3.96 inches. Rain fell on 88 days in May and June, the maximum number of raining days in succession being 11, from May the 25th to June the 4th. The maximum number of clear days in succession was 10, from January the 1st to January the 10th. Snow fell on January the 27th and 28th, and on February the 7th and 11th, the total amount being 6.23 inches when melted. During the whole year, rain fell on 156 days; and 143 days were clear. A series of diagrams is shown, representing at once the rainfall and the direction of the wind. These show that during the Autumn and Winter the rain is generally accompanied by north-west winds, but during June, which was especially the rainy month, the accompanying winds were almost entirely from the west. The same is true for July, but during August the direction was mainly from the east. Taking the whole year together, by far the greater number of rainstorms were accompanied by winds from the north-west, north and north-east; in other words the prevailing direction was from the north.

While, of course, the diagrams which represent the meteorology of a single year cannot be relied upon as a means of generalization, yet it is believed that they afford the most convenient means of studying the various phenomena in their relation to each other, and if continued through a series of years they must become the source of much valuable information.

The meteorology of Japan, and especially of this part of the country, is a subject of great interest, and it is to be hoped that the series of observations and reports now begun may meet with no interruption.

#### ADULTERATION.

TO few subjects affecting the domestic interests of the people has more attention been paid during recent years in civilized countries than to the adulteration of food and drink. In France the practice of scientific adulteration is generally supposed to have commenced sooner than in England, but if so its suppression also began earlier. There

the skill of the analyst was followed rapidly by the hand of the law; and no sooner did the French chemists demonstrate the fatal extent to which numerous articles of diet were being contaminated, than the French Government undertook the punishment of the adulterators, and directed that the police should use all possible efforts for discovering offenders. A considerable time elapsed before similar action was taken in England, and then the matter was forced upon the Government by the voice of public opinion, expressing the imperative demand of a community startled into action by the appalling exposures which resulted from the labours of the celebrated *Lancet* commission. Now, throughout the British dominions, penalties for adulteration are sufficiently severe and rigidly enforced. For example, in two recent cases a publican was fined £50 (the lowest penalty) for putting sugar into beer; and a dairyman was mulcted in the sum of £10 for adding sixteen per cent of water to the milk supplied by him to retail dealers. The adulterants in these instances were not in themselves noxious, sugar merely increasing the intoxicating properties of beer; while the reason for the addition of water to milk is self-evident; but the cases are valuable because they shew the extreme care with which the laws of England protect the health of the people, and endeavor to ensure the purity of the multifarious articles of human consumption. Adulteration, however, is still pursued to a very considerable extent, notwithstanding the penalties attaching to the practice, and appears in the most unexpected forms. Not long since an inquest was held on the body of an infant whose death was alleged to have been caused by poisonous violet powder. The evidence showed that, after the application of the powder, the skin of the child showed signs of irritation, and a large blister formed over the whole length of the body. Expert testimony proved that the poisoning was due to a large percentage of sulphate of lime in the powder, and the jury found a verdict in accordance with that evidence, adding that violet powder should not be sold without having been properly analyzed and then only under proper supervision. The importance of the question of adulteration is also, as might be expected, attracting a full need of attention in the United States, where the Committee on Manufactures, appointed by Congress, lately furnished a report upon which has been prepared "a bill to regulate the manufacture and sale of articles of human food and drink." The report of this committee is long and interesting, and is predicated upon analyses made of many articles of food by Professor Collier, the well known chemist to the Department of Agriculture, and other eminent scientists, men of world-wide fame in their respective specialties. The disclosures made by Professor Collier and his confrères, respecting the extent to which adulteration is carried on in America, are positively alarming. Referring to the apparently simple article, coffee, the report informs us that six packages, each containing two small boxes of coffee-berries, were purchased. These berries were weighed, washed, and the turbid washings evaporated to dryness. By this treatment added substances were removed, and the following table indicates the per centage of the total weight of berries:—

	Colored berries.	Uncolored berries.	Per cent of difference.
No. 1.....	147	79	68
No. 2.....	72	53	19
No. 3.....	90	82	8
No. 4.....	128	64	64
No. 5.....	114	51	63
No. 6.....	91	33	58

The residues were then treated, and left, when burned, "a yellowish residuum which contained in every case chromate of lead, phosphate of calcium (indicating bone black) and insoluble sulphate of barium. These salts were added to these

berries for the purpose of 'facing' them, and by improving their appearance to enhance the market value of the berries. These salts were in no case found in the residues of the uncolored berries."

The outlook for the lovers of "pure Mocha" is not, under the circumstances, an agreeable one; but they at least have anyrate the negative consolation that tea-drinkers are in an equally bad, if not worse, condition. Referring to adulterations of tea,—which we have recently treated at some length,—the report affirms that:—"Our own citizens have far surpassed the heathen Chinese in successfully adulterating this article. Samples of what seemed good gunpowder tea,—found in Washington Market, New York,—under microscopic examination seemed to be fully one-half Prussian blue. In analysis, only enough tea dust was found to impart a smell."

In regard to "oleomargarine," the delectable substitute for butter to which we have referred on one or two occasions lately, Mr. Geo. Angell, chemist, is quoted as saying:—"I have microscopic photographs of oleomargarine showing the foreign living organism and eggs resembling those of the tape worm." The same gentleman also remarks that "the evidence of adulterations of sugars and syrups is simply overwhelming; chloride of tin, a poison, was found in twelve out of fourteen samples analysed; and ninety-nine barrels of sugar out of every one hundred recently sold in Chicago are adulterated." Milk, too, has not escaped. Mr. Angell asserts that "90 per cent of the milk sold in Boston is adulterated, and infants fed upon it are being starved if not poisoned." The result of the labours of the committee has been the introduction of a stringent measure under which "anyone who manufactures, imports, sells, barter or offers for sale any article of human food or drink, adulterated in anyway, or by any process, with any substance poisonous to life shall be subject to a fine of not less than one hundred nor more than one thousand dollars, and to confinement in the public gaol or penitentiary for a period not exceeding one year." There is every reason to believe that so necessary a measure will be passed into law, although we read that the oleomargarine manufacturers are present at Washington in great force to defeat it, a course of action on their part which speaks volumes for the peculiar industry they represent, since it is only substances "poisonous to life" that are affected by the proposed legislation.

However, it is not in such articles as coffee, tea, butter, etc., that the adulterator chiefly excels: to find him indulging in the full scope of his genius we must accompany him to such liquids as beer, brandy, rum, gin, etc. In a work entitled a "Practical Treatise on Brewing," published before the passing of the adulteration Acts, the author stated boldly that it was impossible to produce "the present-flavoured porter without them"—meaning drugs. One of the principal drugs used in the sophistication of liquors of all kinds is *Cocculus Indicus*, the fruit or berry of the *Menispermum Cocculus*. It contains from one to two per cent of a poisonous alkaloid and the seeds in powder or decoction give rise to nausea, vomiting, and griping pains, followed by stupor and intoxication. Mr. Taylor in his standard work on "Poisons" mentions cases of men being poisoned after drinking rum impregnated with this deleterious substance. "The introduction into the stomach of raw spirits is sufficiently destructive to health of itself," says the *Lancet*; "but the addition of *Cocculus Indicus*, Grains of Paradise, and Cayenne to spirits, forms a compound which no human stomach or system, however strong, can long withstand;" and yet these are the very substances in most common use for the adulteration of spirits because they restore to watered liquor the taste and inebriating qualities of strong spirit.

Fusel oil, too, is present in large quantities in low-class liquors, particularly gin and whisky. "Such spirits," i.e.

those impregnated with this oil, says Dr. Ure "intoxicate more strongly than pure spirits of the same strength, and excite in many persons even temporary frenzy." "It appears" according to Mr. Taylor, "to have at first a stimulating and afterwards a depressing effect."

What wonder is it, then, after the experience of other countries, that here in Japan, where there is no check upon the proceedings of the unscrupulous and dishonest trader, adulteration is rampant? In sentencing the man Ross to death for the brutal murder of his unfortunate shipmate, General Van Buren pointedly remarked—"You were not drunk, but had swallowed just enough of the vile compounds sold in the dens of Yokohama, to fit you for the deed you contemplated." Can nothing be done to remove the stain which rests upon the country of allowing the wholesale adulteration now so general? Surely the Government and Foreign Representatives could devise some means of affording to native and foreign inhabitants of Japan the same safeguards for their health found imperatively necessary elsewhere? And when the time comes, as it must sooner or later, for a proper consideration of this matter, it will inevitably entail the establishment of a system which will place "the vile dens of Yokohama" under proper supervision.

THE Geneva correspondent of the *Times*, writing on the 24th of March, states that the frequent occurrence of earthquake shocks in Switzerland during the previous twelve months had suggested, to the Helvetic Society of Natural Sciences, the formation of a permanent commission for the observation and study of these phenomena; and at their instance Professor Hein, of Zurich, has published a pamphlet which gives in a compendious shape much interesting information on the subject, especially as touching the character and consequences of earthquakes in Europe in times ancient as well as modern. Japanese readers may be a little astonished to hear that shocks as severe and destructive as any that have been experienced in this vicinity have occurred in the central continent. The most notable and disastrous earthquakes on record are those of Italy (526), when 120,000 persons are said to have perished, and of Sicily (1693), in which 60,000 inhabitants of the island lost their lives. The great earthquake of Lisbon occurred in 1755, and the most fatal Calabrian earthquakes were those of 1783, 1854, and 1870. Between 1850 and 1857 the number of earthquakes observed in every part of the globe reached a total of 4,620, not a few of which consisted of many distinct shocks. Of this total 1,005 extending over 582 days, occurred in the western Alps, and 81, on 69 days, in the eastern Alps. In the spring of 1764, 20 shocks were felt in Glarus in one month, the greater part of which were not perceptible in the neighbouring cantons. In the year 1870, although no extraordinary catastrophe happened, 2,225 houses in Italy were destroyed or greatly damaged by earthquakes, 98 people killed, and 223 wounded. Taking one day with another, Professor Hein tells us, two earthquakes occur on the globe every 24 hours. Sometimes these comprise one shock, sometimes several. They may be confined to one locality, or embrace within their limits entire continents. On November 16th, 1827, all the country between Bogota and Popayan, a distance of 1,500 kilometres, was visited at the same instant by an earthquake of exceptional violence. The shock of the Lisbon earthquake extended over an area four times as great as the whole of Europe; and in 1856 a single shock made itself felt along the entire littoral of the Mediterranean, from Syria to Corsica. On the other hand, the shock that in March, 1879, threw the people of Lintthal (Glarus) out of their beds, was felt neither in the north of the canton nor in the valley of the Upper Rhine. It would seem that it is sometimes valleys, sometimes mountains,

that mark the limits of a shock, albeit earthquakes are often felt simultaneously on both side of the Alps. The same earthquake, considers Professor Hein, may continue intermittently for months, and even for years. Thus the one which began at Viège, in the Valais, in July, 1855, did not finally cease until 1857. Japan does not possess any distinctive privilege of danger from seismic disturbance, or of frequency of perturbation. At Honduras, in 1856, 108 shocks were counted in one week; at Hawaii, in 1868, 2,000 occurred in one month. The strongest shock is rarely the first of the series, and never the last, while the most destructive often endures only two or three seconds. The conclusion of the correspondent's letter may be of passing interest to some of our local seismologists.

Earthquakes are divided into three categories, distinguished from each other by the impression they make on the senses and their mechanical effects. 1. A concussion having a vertical motion and a straightforward shock; 2, a concussion with a horizontal motion and a lateral shock; 3, an undulatory movement, during which the ground oscillates with a wave-like action. In the same earthquake a central concussion occasionally coincides with an undulatory movement at the extremities of the affected region. The professor gives examples of the effects of these various movements. In Calabria, in 1783, houses were shot upwards as if they had been blown up by gunpowder, and paving stones traversed the air like cannon balls. At Rio Bamba, in 1797, corpses were projected from their graves and several hundred persons lifted bodily across a river. In Calabria on one occasion the approach of the wave could be perceived before it was felt by the tossing of the trees, and at Caracas, 1812, the earth was agitated like a liquid in a state of ebullition. Besides the earthquakes perceptible to the sense, the movements of the ground, which can be detected by the use of suitable instruments, are innumerable and almost incessant. So far, indeed, is our globe from being the solid thing we are apt to consider it, that it is almost always in a state of agitation and unrest. On the other hand, the most careful observation has hitherto failed to confirm the theory of a regular rotatory movement. That of the coincidence of earthquakes with atmospheric phenomena is better supported by facts, for they are occasionally preceded or accompanied by thick and wide-spread fogs at seasons when fogs are not frequent, by sudden falls of the barometer and equally sudden changes of temperature; their occurrence, however, in the majority of cases coincides with normal meteorological conditions. Earthquakes are more frequent after sunset than in the daytime, in autumn and winter than in spring. The influence of the moon is insignificant. As for the supposed connexion between earthquakes and volcanoes, although the existence of volcanoes in the centre of earthquake zones cannot be questioned, it is equally indisputable that many earthquake regions are destitute of volcanoes, and in the Sandwich Islands there are often eruptions without earthquakes, and earthquakes without eruptions. The Alps, which constitute an earthquake zone of considerable extent and activity, show no trace whatever of volcanic action, and in the greater number of instances there is no apparent connexion between volcanic eruptions and disturbance of the earth's surface. The earthquake zones of Europe are the Iberian Peninsula, and the Alps, in only one of which are there active volcanoes, and the general conclusion of Herr Hein appears to be that the theory of earthquakes and volcanoes having a common origin, or of the latter having any influence on the former, has little, if any, foundation in fact. The professor makes no mention of the most calamitous earthquake that ever befell in Switzerland—perhaps because it is so well-known to his readers—the terrible one by which the city of Basle was devastated on the Day of St. Lucas (October 18), 1356. The cathedral, all the other churches, and many houses were either destroyed or seriously damaged, and hundreds of people buried in their ruins; and, as often happens in such cases, a fire broke out directly afterwards and completed the work of destruction. It is significant of the impression made by earthquakes on the imagination that, although upwards of 500 years have elapsed since the catastrophe of St. Lucas's Day, Basle has suffered since that time more cruel afflictions—such, for instance, as the 'black death,' which carried off almost an entire generation—all save this have sunk into oblivion, and until very lately its anniversary was kept as a solemn fast and commemorated by religious services. Even now, while slight earthquake shocks are re-

garded in most parts of Switzerland merely as interesting natural phenomena, their occurrence causes real terror in the canton of Basle.

IT is not now too late to notice an able article which appeared in the *Daily Alta California*, of the 2nd of February, on the Japanese postal system. Mr. Clarke, who left the service of the department on the 1st of January last, and had arrived in San Francisco shortly previous to the appearance of the contribution, is acknowledged, by the editors, as having furnished the information which it contains. Now, as the gentleman mentioned was evidently and naturally one of the foreigners best capable of giving the history of the institution, and the details of its organization, it is a pity that several inaccuracies have been allowed to appear in the statement made. However greatly the Japanese postal service may be indebted, to the foreign employés engaged, for its gradual extension, development, and ultimate perfection of organization, as far as regards its foreign mail operations, those gentlemen,—at least those of them who are still on the spot,—would be the first to disclaim concern in the establishment or completion of the domestic mail scheme. The Japanese Government has no doubt adopted foreign models for the construction of this branch of its service, but it has effected it without the assistance of any foreigners. For the very efficient postal communication which is now extended to all parts of the empire, the gratitude of Mr. Mayeshima's countrymen is due, under the government which initiated the measures, to him and his subordinates alone.

THE revelations made in the Consular Courts not only in this vicinity but throughout other parts of the Far East of the extent to which the sophistication of the liquor supplied to sailors ashore, under an untrammelled, because unlicensed, system of sale is carried, constantly gives rise to the inquiry whether no amelioration is possible. In this as in other respects, so long as extra-territorial jurisdiction prevails, a unanimity which is very difficult to arrive at is necessary in representative and consular councils before the evident grievances complained of can be removed. Brandy imported to Yokohama at an invoice cost of \$1.75, more or less, per dozen, can hardly be a pure and wholesome beverage. To what extent it and other liquors of the same class may be doctored and diluted by the irresponsible grog-sellers of the settlement does not require any great range of imagination to suppose or realize. It is a thankless and all but hopeless task to insist upon the necessity of concert among the administrators of law and protectors of order in such a crowd of jurisdictions and perhaps conflicting national interests; but the subject is of more than sufficient local interest to render it our duty to recur to it. In the present condition of affairs in Yokohama, any man with the necessary few dollars or cents of cash or credit can procure enough liquid poison to open a saloon for the entertainment of sailors. What the fare is, and what results it is likely to produce, an evening stroll through Honmura Road when a number of sailors are on leave, will abundantly demonstrate. For the rest, the records of the local foreign magistracies teem with evidence of the terrible effects produced by the quality of the potatoes furnished to poor "Jack ashore" in Yokohama.

THE case of Debenham and another v. Mellor, decided in the Court of Appeal at Westminster on the 24th of last March, must have carried consternation into the ranks of tradesmen. The whole question of the right of a wife to pledge her husband's credit, which has long been supposed to have been settled by the leading cases of *Seaton v. Benedict*,

and *Montague v. Benedict*, is again raised; and the very foundation of the principle upon which tradesmen have proceeded in practice with regard to giving credit upon the wife's authority is involved. The case, therefore, becomes one of great importance. The facts are simple enough. The action was brought by a firm of drapers against the manager of a hotel, for goods supplied to his wife and it was admitted that the goods so sold were such as would be reasonable and proper in the lady's station in life. The plaintiffs further proved, and it was not disputed, that the defendant and his wife were living together, apparently on the most friendly terms, this point being an important element in all cases of the kind. It would thus seem, following the decisions in the leading cases to which we have already referred, that a *prima facie* case had been made out by the plaintiffs' shewing that the wife of the defendant had authority to pledge her husband's credit for the articles she had purchased. The defendant, however, pleaded that he had expressly forbidden his wife to incur any liabilities on his account; but it was not pretended that this prohibition had come to the knowledge of the plaintiffs. At the trial in the Court below Mr. Justice Bowen ruled that the husband could thus withdraw the authority which would otherwise be presumed from the fact that the husband and wife were living amicably together, and that it was not necessary for the tradesman to know of the prohibition to purchase upon credit, if it in fact existed, leaving to the jury merely to say whether as a fact the defendant's wife had been forbidden by him to incur debts on his account. In this state of things there could be but one verdict; as what the husband swore he had said to his wife could not possibly be denied by the plaintiffs, and so judgment was entered for the defendant. The plaintiffs appealed, and the ruling of Mr. Justice Bowen was supported by Lord Justices Brainwell, Baggallay and Theigier, who were unanimous in their judgment. Some little doubt was raised, however, whether the decision would hold good against use and wont, that is when the husband had been in the habit of paying bills incurred by the wife with the tradesman by whom he was sued, but in the case of a "first order" the Judges were absolute, and their decision finally settles the law on the subject. As the matter stands, therefore, all a husband has to do is to forbid his wife to pledge his credit, and she may order what she pleases, for, as a *feme covert*, she will not be liable, and he being opposed to credit transactions will not be liable either. One exception has, however, been made to the rule now laid down; and that is as regards household bills for actual necessities of life. As a contemporary humorously remarks, "the famous authority of women to pledge their husband's credit is circumscribed within the narrowest limits. It will run to beef, but not to bonnets; a cabbage may be purchased without and even in spite of authority, but not a costume."

SOME years ago favourite fallacies were entertained in Shanghai, and the other treaty ports of China, respecting the wealth, asserted to be fabulous, of the isolated Korean Kingdom. One notion was that the corpses of the Kings were interred in coffins of pure gold. It was with the object of recovering some of these substantial treasures, and not with the more sentimental notion of digging up a few old bones and holding them to ransom, that Mr. Oppert is popularly believed to have organized the absurd filibustering expedition which resulted in such disastrous failure. The author's impertinence in publishing his account of the forbidden land is being exposed on all sides. Mr. A. A. Hayes, Junior, an old American resident in China, who was one of the "associates" on the Consular Bench at the trial in Shanghai of

a companion of the would-be marauder, writes as follows from New York to the *Nation* :—

The notice of Oppert's book on Corea, in your issue of the 7th instant, recalls some curious incidents to my mind. The raid on the king's tomb was one of the most extraordinary affairs ever known. Its inception and failure might have been concealed but for the Coreans, when they attacked the ghouls, killing an unfortunate Manilaman. Hearing of this, the Spanish Consul applied to Mr. Sewall (U. S. Consul-General at Shanghai), who at once arrested Jenkins. I was one of the four "associates" summoned to sit with the Consul-General in the trial, and well remember what a perfect burlesque it was. The Chinese, who had told a plain and coherent story on preliminary examination, were as dumb as oysters on the stand. When all had been called, the defendant's counsel said that he would rest his case on their testimony. Conviction was impossible, but, in the minds of those informed on the subject, the wickedness of this buccaneering expedition was remembered as surpassing even the absurdity of an attempt to destroy a granite mausoleum with coal-shovels. There is monstrous impertinence in Oppert's publishing an account of a piratical fiasco which is reported to have cost him a term of imprisonment at home.

IT does not appear to be very likely that Corea will for ever, or even for long, be allowed to enjoy that seclusion from intercourse with western nations which she shows so evident a desire to preserve. From the little that can be gathered from Commodore Shufeldt, it is evident that there was no alacrity on the part of natives, whether of private or official station, to enter into any relations with the *Ticonderoga* during the brief sojourn of that vessel in the port of Fusan. It is not definitely known, except probably to the chief of the expedition, when the man-of-war will return towards Corea: still less certain is the course that will be pursued on her arrival there. The nature of her reception must depend much upon the part taken by the Japanese, and the action of their Consul in Fusan is reported by the native press to have been eminently considerate and mediatory. The *Mainichi Shimbu* asserts that he used his utmost endeavours, but with complete failure, to induce the Governor of Torai Fu to forward the credentials of the American commander to the court at Seoul. The Government of Japan has probably, if it will only exert it, enough influence with that of Corea to persuade the latter to enter into treaty relations with the West. Failing to secure cordial Japanese coöperation,—and without it Commodore Shufeldt need hope for no concession from the people with whom he would negotiate,—it is difficult to imagine how he can do other than abandon the enterprise. With the force at his disposal he would hardly be warranted in attempting coercion, even if instruction from his Government authorized such a course, which again would be contrary to the declared policy of the United States. Whatever may be the result of this mission, however, it is apparent that other countries are eager to compel the Coreans to trade with them; and the final conclusion is inevitable. The Japanese press speaks, already, of an armed landing made by the crew of a Russian vessel at Ko-kin-dai.

#### SEISMOLOGICAL SOCIETY OF JAPAN.

ON the afternoon of Tuesday, the 25th instant, a meeting of the Seismological Society was held in the lecture hall of the Tokio Dai Gakko. The proceedings were directed by Mr. Hattori, the Vice President of the University, who has accepted the post of President of this newly formed society. Mr. Hattori adds to his knowledge of the English language a perfect ease and acquaintance with the routine of a public meeting, and thus, besides giving a sort of native and official countenance to the proceedings of the society, is able to fulfil, as thoroughly as could be desired, all the functions of a chairman. Mr. Knipping was first called upon to read his paper, in which he explained the principle of certain instruments designed jointly by Dr. Wagoner of Kioto and

himself; the present communication being an extension and amplification of theories laid down by the former gentleman in a paper in 1878. The lecturer referred to three different contrivances to be suspended from separate arms at the top of a heavy wooden framework, these instruments having the respective functions of registering the horizontal motions of an earthquake shock in two different ways and at the same time stopping a clock in order to fix the moment of the first shock. One consists of a pendulum suspended from a hanging weight. Another has the form of a light wire wheel hung horizontally from eight points on its circumference by separate threads united above, and having on its underside eight separate needles, which are alternately depressed or lifted according to its motions. Great care is taken to give rigidity to the supporting frame in order to prevent its vibrations affecting the instruments. Mr. Knipping also explained a contrivance for registering vertical shocks. It consists of a light buoy placed in a tub of water, and connected by a taut thread with a lever which marks its motion. With regard to this apparatus it was explained, that a vertical motion of the ground would take the water with it, but that the buoy would not immediately follow and this would mark the extent of vertical upheaval.

At the same meeting Mr. Gray, of the Koku Dai Gakko, read a paper in which he expounded two different applications of the pendulum principle; a principle which he said had first been applied in Japan to the measurement of earthquakes by Dr. Verbeck. Mr. Gray's first pendulum indicator is suspended from tight cross wires upon a light frame, a heavy weight at the end of the pendulum being connected at its centre of inertia with three silk threads passing over pulleys and marking a register. By this instrument it was proposed to register three component horizontal motions of the same shock, and from these to obtain by calculation the actual motion of the earth's surface, a result which, he believed, could not be ascertained correctly with less than three separate indications. At the same time a direct register of the motion of the pendulum would be taken, by a needle fixed at the bottom of the pendulum marking on a smoked glass, and would be useful as a check to the others. Mr. Gray also explained another arrangement—for a pendulum hung from a spring to a table, carefully contrived so as to secure perfect rigidity. By this the lecturer proposed to obtain records of both vertical and longitudinal motions, the number of vibrations and the intensity of the shock.

In the discussion which followed, Professor Chaplin of the Tokio University explained, that he experienced a general feeling of dissatisfaction with all instruments for registering earthquakes which were started into motion in the first place by the shock itself: for the result was that the motion of such an instrument was never actually simultaneous with, but always, appreciable after the earth's movement—a certain time being lost in setting the machine in motion. He himself had abandoned several contrivances of his own simply from this objection to them. In one apparatus, with a sliding paper to register the markings, the shock was perceptibly over, before the paper began to move: in another the shock had finished before the pendulum was fairly over. The speaker considered that we must have an instrument so constructed with clockwork or otherwise, as to be in motion at the time of shock, to enable us to judge of the extent and force of the earthquake by the variation occasioned in the normal movement of the instrument at the time. Professor Chaplin, in referring to a portion of Mr. Knipping's paper, in which the author proposed checking off, by hand, time-periods from registered intervals on paper with the aid of a watch, thought that considerable inaccuracy was thus unavoidable. He had himself made experiments in the simple action of calling to a friend to mark down periods simultaneously with his cry, and found that in reality much time was lost in this, apparently, instantaneous process. Professor Mendenhall also made a few remarks to the same effect. He proposed a motion of a pendulum for marking off periods as much more accurate than the greatest manual delicacy could be.

It was suggested that a committee should be appointed to examine and report upon all seismographs and other instruments submitted to the society. This seemed to meet with silent approval; and such an arrangement appears, indeed, very necessary in order that the worth and originality of the different theories suggested may be properly ascertained before they are presented to the society in general reunion. Though it may possibly have the effect of disheartening some

ambitious seismologists, it should also have the salutary result of preventing unnecessary renovations of exploded theories, or perhaps even any such dire consequences as attended that meeting, of a Geological Society, which has been so graphically recorded by Bret Harte.

## MUSEUMS AND EXHIBITIONS IN JAPAN.

### IV.—KIOYUKU HAKUBUTSUKAN.

THE most pretentious exhibition in Tokio, so far as the building which contains it is concerned, is certainly that which has the name of the Educational Museum; and is situated in the Ueno Park. The edifice is a two-storied, plastered structure, of foreign nondescript style, with some minor Japanese features. The museum, as might be supposed, belongs to the Mombusho or Educational Department, and a great part of the collection consists of modern school-furniture and appliances. Near the entrance are hung a number of large photographs of foreign schools and institutes, with plans, elevations and perspective views of various notable educational establishments in Vienna, America, England and elsewhere. Arranged near to these are models of schools and gymnasia and a number of full-size specimens of school furniture. The training of infants is represented by a large display of the coloured alphabets, puzzles, and other instructive playthings, by means of which young children are first seduced into a thirst for knowledge. There are some fine maps and globes to be noticed, as well as elementary astronomical charts and models.

No physiological phenomenon is much more curious than the extreme want of sympathy with European music naturally felt by the Japanese, or, we might say, *rice reared*, by ourselves for that music which evidently moves the people of this country in a way which we are at a loss to understand. The Educational Department seems, however, to have determined that the cultivation of European music must form part of the future education of the people. There are specimens of the piano, harmonium, and tonoscope-harmonium among the educational appliances of the exhibition. The Mombusho has lately added to its staff of foreign teachers a professor of music, and a large music school is being built at Kaga Yashiki. The War Office has, long since, adopted the idea of foreign wind instruments and bands for the army.

Among the exhibits may be noticed philosophical, and mathematical instruments, as well as stores of chemicals and chemical apparatus. Drawing is represented by a number of copies, casts, and perspective and geometrical models, as well as by the tricks of "drawing made easy," which are so much and so uselessly employed in some of our schools in Europe. There are also to be observed educational books for the blind, in which we see that the Japanese characters have been applied to the system of raised letters. We should mention, in this connection, that a school for the blind has been built and started in Tsukiji, which ought to prove an estimable boon to some of the many poor blind that are to be found in the capital.

In one part of the exhibition we notice a library and collection of Japanese and foreign educational works. This library deserves special mention as it contains standard books which many would probably be glad to consult frequently, if they only knew where they are collected.

The upper story of the building is devoted to collections less strictly educational, such as minerals, stuffed animals, (some rather worse for the stuffing), and fossil-bones and shells. The sciences of botany, geology and zoology are all represented. Worthy of observation also are certain geological models and diagrams, also some large architectural chronos of some of the most notable ancient buildings of Europe. On the whole, this museum is better arranged and more systematic than any others that we have noticed. The height and comparative spaciousness of the building also helps to display the objects to advantage. Free entrance is allowed to all on every day except Monday, when the museum is closed to give rest to the employes who are forced to work for the crowds of visitors that throng the rooms each Sunday.

This Educational Museum at Ueno may be considered, on a very small scale, as the counterpart of the Museum of

the Science and Art Department at South Kensington: which it also resembles in the fact of being situated at some distance from the city, and on the outskirts of the finest park in Tokio. The objections raised, with regard to the suburban position of the London Educational Museum, and the distance to be traversed by the majority of the people who wish to visit it, might also apply to the Kioyuku Hakubutsukan. At the same time it is an open question, whether the healthy, open situation does not render far more salutary any educational advantages to be gained by the far-off resident, dwelling, perchance, in some murky and crowded purlieu, who has to make an excursion in order to visit the exhibition.

## JAPANESE PERSONAGES.

### IX.

#### GENERAL SAIGO TSUGUMICHI.

THE subject of the present memoir is a younger brother of the late Saigo Takamori, formerly Marshal in the Japanese army and leader of the Satsuma clan, one of the promoters of the Restoration, and finally the head of the Satsuma rebellion. Young Saigo's earlier life was devoted to the study of literature, and more especially that which treats of military science. During the war of the Restoration he acted a prominent part, and fought battles in almost every part of the empire, from the commencement to the end of the struggle, always gaining splendid victories, and thus greatly distinguishing himself. After the conclusion of the war he was appointed General in the Imperial army, and nominated a junior noble of the 4th rank, and Commander of the Tokio garrison. Shortly afterwards, when the invasion of Corea had become a great question for discussion in the Cabinet, his views were opposed to those of his elder brother, who strongly insisted upon war, an idea which was ultimately abandoned. The two brothers then parted, the elder retiring from the Cabinet, while the younger remained in the Government; and it is said that from that time there was no real friendship between them. In the Formosa expedition in 1874, Saigo Tsugumichi was appointed Commander-in-Chief, and led the Japanese fleet and army to the island, where, after fighting several battles, he successfully subdued the brave and aggressive savage tribes. The expedition was thus terminated, and a war indemnity of five hundred thousand taels was paid to Japan by the Chinese Government. In 1876, the Philadelphia Exhibition was held, when the General was appointed Vice Commissioner for the Japanese Section. He therefore went to America, where he honorably, and to the satisfaction of all, represented the interests of his country at the great International Exposition. When the Satsuma revolt broke out in 1877, he wished to take up arms against his rebel brother, but the Government would not allow him to do so, perhaps suspecting that he might join his relative, though public opinion was assured that he, at least, would not act with such disloyalty. However, he remained in Tokio, in control of the War Department, during the absence of the then Minister of War, General Yamagata, at the seat of strife. Although Saigo did not take part personally in the campaign, his services in supplying the Imperial forces in the field with provisions and ammunition from Tokio without interruption, was worthy of praise, and greatly contributed to the termination of the war in September of the same year. The assassination of His Excellency Okubo, late Minister of Home Affairs, perpetrated in May, 1878, occasioned some changes in the Ministry. The subject of this sketch was then nominated Privy Councillor and Minister of Education, which latter office he left when he was appointed Minister of War, and Commander of the Imperial Guard in place of General Yamagata, who was transferred to the control of the Staff Office. In consequence of the changes effected in the Ministry at the commencement of the present year, General Saigo remained *Sangi*, having to devote all his attention to the duties of that post. His portfolio for the War Department was confided to General Oyama, and the command of the Imperial Guard was assumed by His Imperial Highness, General Prince Higashi Fushimi.

## CORRESPONDENCE.

[Our readers must distinctly understand that we are in no sense responsible for the sentiments or opinions of our Correspondents, for the accuracy of their assertions or for the deductions they may choose to draw therefrom.]

## ON SANITARY REFORM IN JAPAN.

To the Editor of the *Japan Weekly Mail*.

DEAR SIR,—May I request the hospitality of your columns for the following paper, which gives a brief sketch of the Sanitary reform in Japan during the last year.

But as a learned Professor of the University in Tokio, Mr. J. A. Ewing, has published the contents of his lecture "On Sanitary reform in Japan," in your valuable journal dated 15th May, 1880, I feel that I owe to you and the reader an explanation of the reason why I address myself to you on the same subject.

I had expected a clear and true account of the principles lately adopted by the Imperial Japanese Government in the matter of sanitary administration, and I was at first agreeably surprised by the prospect of such an account being given by a savant, who is not officially or directly connected with any branch of sanitary administration in Japan. I felt sure that there could not be any question of an *oratio pro domo* in his lecture, but only of an independent judgment of the new system adopted.

As I proceeded with reading the lecture, I felt, however, disappointed in many of my expectations; for, although the title says that the lecture treats of "Sanitary reform in Japan," I was not able to find anywhere an account or even a brief sketch of this reform. Instead of the latter, there are but complaints: "that the engineer's part in the sanitary administration is neglected, and that the present state of sanitary matters in Japan is not satisfactory nor even tolerable."

Now, as the author of the lecture does not give the reader an account of the lately adopted system, the question presents itself:—Is it true, what the lecturer says, that the engineer's part in the new system has been either forgotten or neglected? The reader of Mr. Ewing's lecture, who might not happen to be already acquainted with the new system, will receive the impression—as I did—that the "doctors," attached to the sanitary administration in some way or another, had usurped that part of sanitation which properly belongs to the engineer. That such is not the case and that Mr. Ewing is therefore mistaken as to the chief object of his lecture will result, I venture to remark, from the following account, which I wish to lay before you and the reader. I regret thus to be compelled to rectify what I call a misstatement by one of your able contributors, because the relation of what has been done in the matter of sanitary reform in Japan properly belongs to the director of the Central Sanitary Bureau of the Ministry of Home Affairs. This gentleman will certainly give, in due time, to the world, an official statement of all that has lately been done, because the object of the yearly reports of the Central Sanitary Bureau is no other than to state the work done by all who are connected with sanitary government in this country.

As several foreign gentlemen are, as I am myself, connected in some way with the care of health-matters in Japan, it seems better to explain now at once the principles of the new system of sanitary administration, and it seems the more warranted to do so, as the whole matter is by no means a secret, but on the contrary, of general public interest.

The account to be given by me will, moreover, serve to tranquillize Professor Ewing when he sees that the engineering aspect of sanitary reform in Japan has in principle not been neglected, but has in reality received the attention it requires.

Before commencing to explain the new system, I beg leave to pass in review some of the other points in Mr. Ewing's lecture, because it is but very rarely that the learned author recognizes the facts brought to light by others than himself before the time when he published his own lecture,—a proceeding from which the reader is sometimes left to infer that it is to Mr. Ewing, and not to the previous unnamed writers, that many of his statements are due.

For instance under the heads of water-supply, drainage and removal of excreta, many very true remarks are made by the author in regard to these subjects, but we find exactly the same remarks in the reports of the Yokohama Board of Health and in my own paper on the drinking water of Yokohama, published nearly two years ago in the transactions of the Asiatic Society, Vol. VII., as I will show hereafter.

There is, however, one original feature in the lecture, and that is Mr. Ewing's opinion that Japan, which only very lately commenced to give any official attention to health-matters, ought now at once to possess all the modern systems of water-supply, sewerage and drainage, which we admire in some of the more advanced European States. In his desire to see everywhere sanitary engineers at work in this country, the author forgets that even in the United States, and in the more advanced European States, such costly improvements were only made gradually and not within the short period of a year or two. Let us look into the back streets and dens of London, or any

other metropolis, and we shall find that the engineering aspect of sanitary reform does not yet receive even there all the attention it requires. I cannot but believe that Mr. Ewing would also pronounce the present state of sanitary matters in these back streets not satisfactory, nor even tolerable.

I am the last not to recognize the grave faults, which exist still in this country, especially in the larger and low-lying towns and cities, in regard to drainage, water supply, mode of constructing houses and closets, and public cleanliness generally. In my own reports, as well as in the reports of the Yokohama Board of Health, the truth has never been concealed, and the necessity for improvement has been repeatedly demonstrated. But would it be fair to throw blame on the people in this country or its Government, because all the improvements advised have not immediately been carried out?

The ameliorations advocated by Mr. Ewing in his lecture, were recommended by me and others long before he gave his lecture. Many of them require a relatively large outlay of money and, moreover, engineer's skill. Such great works cannot be made at a moment's notice in a country like this, but have to be introduced gradually. It is probable that the difficulty of raising the money for these improvements will become less, after the matter has been often discussed and made, so to say, a public topic. The people, or at least the better classes of the people, must first understand and be convinced of the great value of costly sanitary works, before we can think of their practical execution in all the larger towns of Japan.

Mr. Ewing is himself aware of all this when he says: "Of course the great difficulty in carrying out such works is their cost." Just so, the cost forms the greatest obstacle, not so much the want of engineering knowledge, for there are several very competent engineers with Mr. Ewing, in the Japanese service, who can give, and have already given, much valuable aid to the Sanitary Bureau, or to the local Government offices in regard to subjects of sanitary engineering.

When Mr. Ewing considers the present water-supply of Tokio, and condemns the state of things as excessively bad, then he is partly right, but why does he not make any mention of the very elaborate plan of a new iron aqueduct for Tokio, carefully prepared three or four years ago by Mr. C. J. van Doorn, chief engineer of the Netherlands' waterstaat, at present attached to the bureau "Do-boku-kioku" of the Ministry of the Interior? What must one call Mr. Ewing's proceeding of lecturing *ex cathedra* upon the Tokio-aqueduct and water-supply, without knowing what has already been done in the matter? The project of Mr. van Doorn, which not only provides for drinking water for the whole city, but also fire-cocks and a special arrangement for watering the streets, has been, "in principle," adopted both by the Ministry and by the Tokio Fu; but the cost of erection has been the only reason why the plan has not yet received practical execution. I am sure that this great sanitary improvement for Tokio is not now an engineering difficulty, but simply a matter of finance; and I know that the Government will carry out Mr. C. J. van Doorn's excellent project, as soon as the financial difficulties of the new enterprise are removed; this may last perhaps a shorter or longer time: I feel sure, however, that the matter will be done. Further on in the lecture we find the following:—"By a process of analysis chemists can detect whether water has been exposed to contamination by sewage . . . Professor Atkinson of this University has made analyses of specimens of the Tokio water, taken from different points along the course both of the Tama and Kanda system of aqueduct."

With all due respect to the excellent work done by Mr. Atkinson, I ask again why does Mr. Ewing neglect to mention the earlier analyses, made (in 1875) of the Tama and Kanda-water by Dr. Martin, who was then attached to the Government Sanitary Laboratory, and who published the results in the transactions of the German Asiatic Society? Dr. Martin has demonstrated earlier than any body else, that the water of the Tokio aqueduct loses of its original purity in its course through the wooden pipes within the city. Then the author remarks: "that the relative impurity of the water of the Tokio aqueduct is not only due to the diffusion or the leakage of the wooden pipes, but principally to the open distributing wells, where the water is stagnant and where many impurities have easy access." Although these remarks are perfectly true, Mr. Ewing does not say that I stated this fact already two years ago in the Seventh Volume of the transactions of the Asiatic Society, page 224. I then said: "The wooden pipes have, since the year 1878, been extensively repaired from Kashimada-mura down to the neighbourhood of Yokohama. As the last part of the work, in the town of Yokohama, has not yet begun, I should earnestly recommend the diance of the present system of round wooden tubs (distributing wells), placed upon the aqueduct at certain distances, for the purpose of drawing water for daily use. The water naturally rises into these tubs, and stands there as in dead ends, while only the water below flows further. Besides, the dust of the streets and other impurities may enter these cylinders and spoil the purity of the water. Instead of using the distributing wells, I deem it far better to fix at certain distances hand-pumps of different sizes in the wooden pipes, in such manner that the

under-end of the pump-tube is only 2 to 3 decimeters from the bottom of the wooden pipes. Thus the water will constantly be kept running and no outside impurities from the streets will be able to enter the pipes." There can be no objection to Mr. Ewing repeating the statements made by me and others, but we should like to have then the source mentioned, in such a way that the reader may know to whom the matter is originally due.

Mr. Ewing points out in his lecture further defects in the matter of water-supply, drainage and removal of excreta, and he suggests several ameliorations, which are fully worth the attention of the people and Government. But I beg to state that I have pointed out the same defects and that I have recommended the same improvements a long time before Mr. Ewing's lecture, as will be seen from a comparison with my reports.

#### *My own report.*

1. Introduction of a better system of disposal of slop-water, and better constructed drains, care being taken to keep the same watertight, open and clean. The drains now in use are leaky in many places; they do not allow a free passage to the slop-water and are usually not kept clean; they ought to be replaced by watertight open conduits, which allow the filthy water to flow freely through them... All kinds of stinking liquids and putrid gases are by the present gutters communicated to the air and to the soil, and by the latter to the water of the wells.... The proximity of the gutters to the wells and dwellings make them still more dangerous to health, and I think therefore that I cannot insist enough on the necessity of a radical change in the very imperfect system of draining, not only in Yokohama, but in all Japanese towns.

2. The removal of the closets from the immediate neighbourhood of the wells. These conveniences are in this country generally built quite close to the well; should it be impossible, from want of space to remove them, then they ought at least to be rendered perfectly watertight.... Few reservoirs are watertight enough to prevent the excreta from penetrating into the surrounding porous ground and from thus becoming the cause of pollution of the water. To remove these closets from the wells is of the first necessity for the public health. The walls of reservoirs must be made impermeable, so that no liquid whatever may pass through them."

Here a real novelty is to be observed in Mr. Ewing's lecture, viz.:—the pots turning round a horizontal axle. I may state however that the idea, like also that of double pots, has been discussed year the during past in the meetings of the Board of Health, and that, although there was apparently some advantage with the pots above ground and turning round a horizontal axle, it was found by the Japanese members too impractical, (1) principally because people are not accustomed to it; (2) because the expense would be greater; and (3) because far more space would be wanted for building a privy.

3. The termination, extension and amelioration of the Tamagawa aqueduct by conducting its water, which is wholesome and of great purity, by means of perfectly circulating iron pipes through the whole town. The present system of aqueducts, which end here and there in dead points, must be wholly given up.

The analysis of the aqueduct-water, compared with the ordinary degree of purity of good drinking water derived from wells, shows that the Tamagawa water is at the village of Kaibimada (the *prie d'eau* for Yokohama) of superior quality. I have been advocating the use of tight iron pipes, instead of wooden ones, the more so as the pressure could then be easily augmented and special arrangements for fire-cocks and

#### *Mr. Ewing's lecture.*

1. Near to every well is a wooden gutter close by. These gutters are often not provided with a suitable exit for their contents and the dirty water necessarily finds its way into the earth, whence part of it returns to the well.... No stagnant gutters near wells should be tolerated.... The task of removing the surface water from a city is a most enormous and difficult task, but at present, even the most obvious and easy parts of the work are left undone.

2. The soil and the wells are often polluted by the most dangerous form of contamination—the leakage from a neighbouring closet.

No leaky privies near wells should be tolerated.... More frequent emptying of the reservoirs should be enforced.... Glazed pots should be used, and the pot should be placed above ground and supported by a frame, so that it can turn round a horizontal axle."

3. Nothing better than to substitute the present wooden pipes and distributing wells altogether and use iron and lead pipes. Not only will this secure an excellent water supply for the whole town, but the water could with sufficient pressure be conveyed to the top of every house in the city and suburbs; it would serve for extinguishing fires without needing to be forced up by fire engines. The only disadvantage is the cost, which would be great, perhaps about two million dollars. The distributing wells should be clear of all sources of pollution. Loose covers might be provided to keep out dust. The distributing wells draw their water partly from the pipes and partly from the ground. The pipes should be disconnected from such wells as draw their

water also partly from the ground. The pipes should be kept in good order, etc.

From the comparison of the most important points in Mr. Ewing's lecture with the conclusions of my own report, it will easily be seen that the lecture is merely a repetition of what has been written before by me and others on the subject of water-supply, drainage and removal of excreta; while on the other hand the lecturer does not give an account of the system of sanitary administration, lately adopted by the Japanese Government.

The explanation of the latter system will be the subject of the following lines which I hope will be read with some interest by many of your readers. The system is founded upon the following three distinct divisions:

- I.—Executive Central Sanitary Government.
- II.—Advising (Scientific-professional) Sanitary-Boards.
- III.—Executive local Sanitary administration.

I.—The Central executive power in regard to health matters is especially in the hands of H. E. the Minister of Home Affairs, aided by the Central Sanitary Bureau at the Ministry of the Interior and the Government Sanitary Laboratories, established in various parts and under the direct orders of the Central Sanitary Bureau.

The latter Bureau is charged with the following duties:

- 1.—The carrying out of all Central Government sanitary laws and regulations, in regard to medicine, pharmacy, infectious diseases, burials and cremation, sale of food, water supply, sale of secret-medicines, sale of poisonous colours for colouring food, epizootics, veterinary regulations, etc.
- 2.—Registration and comparison of the statistics of mortality in the various Fu and Ken, and ascertaining the yearly death-rate in the various Fu and Ken.
- 3.—Statistics and comparison of the march, the degree of intensity, etc., of epidemic and infectious diseases.
- 4.—Statistics and comparison of other (non-infectious), especially endemic, diseases, as far as they are available.
- 5.—Yearly report upon the sanitary condition of the country, with the necessary statistics of causes of death.
- 6.—Control over the exercise of medicine and pharmacy by competent persons, issuing of diplomas or certificates to newly examined candidates, and registering of all the medical and pharmaceutical practitioners within the country.
- 7.—Advice to and correspondence with the local Sanitary Bureaux in the various Fu and Ken.
- 8.—Issuing of orders for immediate or temporary measures of prevention and suppression of threatening epidemics or infectious diseases.
- 9.—Yearly reports upon the work done in the various Government Sanitary Laboratories, in regard to the control upon medicines, patent-medicines, poisons, and other health-matters.
- 10.—Yearly statistics of vaccination and re-vaccination as collected from the various Fu and Ken. Direction and control of the *pare vaccinogène*, in order to secure a permanent supply of fresh, pure and effective lymph from calves.
- 11.—Hospital-statistics, as collected from various Fu and Ken.
- 12.—Veterinary statistics and report on the measures taken for the prevention and suppression of infectious diseases amongst animals.
- 13.—Yearly report and statistics upon venereal diseases and the inspection of prostitutes.
- 14.—Collecting of all useful information on the mineral springs of the Empire, and publishing of the analyses made of the same in the Laboratories.
- 15.—Promotion of a medical, pharmaceutical and sanitary instruction in the various Fu and Ken. Promotion of the home-manufacture of medicinal chemicals.
- 16.—Publishing of a monthly bulletin of sanitary matters, called *Yei-Sei-Zasshi*, in order to diffuse knowledge of health matters as much as possible in the various Fu and Ken.

The Government Sanitary Laboratories are charged with the following duties:—

- 1.—Control over the quality of medicines generally.
- 2.—Sanitary, juridico-chemical and toxicological researches for the various Courts of Justice (*Sai-ban-sho*.)
- 3.—Analysis of ores, metals, food, drinking water, medicines, etc., for private persons, according to a fixed tariff of cost.
- 4.—Advice and aid to the local Sanitary Bureaux and to the district Boards of Health in various Fu and Ken.
- 5.—Advice and aid to Japanese manufacturers of medicinal chemicals.
- 6.—Advice and aid to the Central Sanitary Bureau in hygienic or chemical matters.
- 7.—Education of students who have finished their regular course in natural sciences, in order to enable them to act as local sanitary inspectors or local health-officers.

#### II.—The Sanitary Boards.

The aim of these Boards is chiefly to advise and to assist the

central and local Executive Government in all health-matters interesting the welfare of the country.

The Boards are divided into three, viz. (1) One Central Board of health; (2) District Board of health, (one for each *Fu* or *Ken*); and (3) Sanitary Committees, to be elected by the people for each *Cho* or *Son* (towns and villages.)

The Central Board of Health is located in the capital and advises and aids H. E. the Minister of Home Affairs and the Central Sanitary Bureau of the Home department. This Board is composed of medical and chemical men, one engineer, a police officer and a secretary of the Department, as will be seen more in detail in the official notification No. 54, which I add hereafter. It follows that Mr. Ewing is mistaken, if he thinks that the engineering part of sanitary administration is not recognized by the Japanese Government.

The district Boards of Health, which are going to be erected in each *Fu* and *Ken*, will advise and aid the Governor and the local Sanitary Bureaux of each prefecture (*Fu* or *Ken*.) The district Board of Health consists of three to five medical practitioners, three members of the local assemblies (*Fu-Kuorai* or *Ken-Kuorai*), the director of the local government hospital, the chief chemist of the latter, the director of the local Sanitary Bureau and one police officer. As the director of the local Health Bureau is in several *ken* an engineer, it follows that the complaint of Mr. Ewing is not quite according to truth. In the Kanagawa *ken* there are even two Japanese engineers connected with the Board.

The sanitary committees in *Cho* and *Son* (towns and villages) have been chiefly established with the object of assisting the sanitary officer and the *Korcho* (burgomaster) in the carrying out of local sanitary measures. The members of these committees are to be elected from the residents by the people, as will be seen more fully in notification No. 56 B, of the Home Department.

### III.—Local Sanitary Bureaux.

In each *Fucho* or *Kencho* (office of the prefecture) there has been established a Sanitary Bureau, for the carrying out of all sanitary measures within the *Fu* or *Ken*. These bureaux will in future possess all three elements, viz. medical, chemical and engineering, but as for the moment a sufficient number of competent men could not possibly be found to fill the respective posts in the various *Ken*, it is clear that the measure, although adopted in principle, can only gradually be put in practice. Besides the chief local health officer, it is the intention to appoint gradually in each *Fu* and *Ken*, two sanitary inspectors or sanitary chemists, one engineer, two physicians and the necessary clerks. How, then, can Mr. Ewing write that the engineering aspect of sanitary reform in Japan has not received the attention it requires? On the contrary it seems to me that the Japanese Government has given far more attention to the engineering part of sanitary administration than many foreign countries do at present.

The duties of the future officers at the local Sanitary Bureaux are going to be regulated in detail, according to the following plan:—

The duties of the chief local health officer are:—

- 1.—Direction of the Bureau. Decision in the correspondence with the Central Sanitary Bureau at the Home Department.
- 2.—Statistics for the Central Sanitary Bureau (statistics of death and causes of death, of birth, of infectious diseases, of vaccination, of hospitals, of prostitutes and venereal diseases, of insanity, of blind, of deaf and dumb, etc.)
- 3.—Immediate communication to the Central Sanitary Bureau, in cases of threatening infectious diseases.
- 4.—Yearly general report, to the Home Department, of the sanitary condition of the *Fu* or *Ken*.

The duties of the sanitary engineer are:—

- 1.—All the branches of sanitary engineering within the *Fu* or *Ken*, especially the filling up, or draining, or raising of low swampy grounds, intended for habitation; the removal of pools, cleaning of canals and of muddy ditches near to inhabited places.
- 2.—All constructions in regard to sewerage and drainage, such as sewers, drains, cesspits, sinks, tanks, etc.
- 3.—All constructions in regard to removal or receiving of human excreta.
- 4.—All constructions in regard to water-supply, such as aqueducts, reservoirs, filter-beds, boring and cleaning of wells, etc.
- 5.—All constructions, in regard to dwellings for the poor, working men's dwelling houses, hospitals, temporary lazarets for infectious diseases, disinfection apparatus, public market-places, prisons, police offices, schools and charitable institutions for the blind, insane, etc.
- 6.—Construction of cremation-furnaces and the laying out of proper cemeteries or burial places.

The duties of the sanitary inspectors are:—

- 1.—Inspection of public buildings within the *Fu* or *Ken*, especially in regard to air, water, drainage, construction of closets and solidity of the building.
- 2.—Control upon the scavenging in general, and the regular removal of excreta from the privies.

- 3.—Inspection of the water-supply, especially in regard to the quality of the water, the dangers of pollution and the relation between the wells of drinking water and the privies.
- 4.—Inspection of sewers and drains, in regard to their cleaning and flushing.

- 5.—Inspection of all nuisances or injurious insanitary conditions of workshops, slaughter-houses, cemeteries or injurious traffic.
- 6.—Inspection of food, especially in regard to fish, meat, animals, poultry, fruits, vegetables, grain, bread, flour, milk, wines, etc.

- 7.—Inspection of such houses or buildings where infectious diseases are reigning, superintending of the cleaning and disinfection of such houses.
- 8.—Inspection of drugs and medicines sold at the druggists' shops, and control upon the due observance of the Government regulations in regard to drugs.

The duties of the physicians attached to the local sanitary offices are:—

- 1.—Inspection of the hospitals within the *Fu* or *Ken*, in regard to cleanliness and the treatment and nursing of sick generally.
- 2.—Care for medical aid to the poor.
- 3.—Care for medical aid to those who are wounded by accidents in the streets and who are brought to the local public hospitals.
- 4.—Care for proper treatment of the insane, of poor, deformed persons, of orphans, foundlings, etc.
- 5.—Arrangement of proper lazarets for infectious diseases, care for isolation of the sick, and disinfection.
- 6.—Superintending the vaccination bureaux, within the *Fu* or *Ken*, and statistics of vaccination.
- 7.—Superintending the inspection of prostitutes and care for proper lock hospitals.
- 8.—Aiding the chief local health officer in his duty of the various statistics enumerated already.

Such is the rough outline of the system lately adopted by the Imperial Japanese Government in regard to the sanitary administration of the country. It will no doubt take some time before the details of the system can all be in good working order, chiefly because the necessary amount of competent officers will only be available after some years. The educational colleges will do indeed a great service, if they are going to instruct the older students in the main and most important hygienic sciences. The future sanitary inspectors will find the best training place, no doubt, at the Government sanitary laboratories provided they have finished beforehand their regular course at one of the colleges. In the sanitary laboratories are daily numerous analyses and reports made on the most different sanitary subjects, and some of my best and older assistants have already gone to various *Ken* to act there as sanitary inspectors or health officers. But as to the engineers, the best places for learning will be the Tokio University or the Kobu-dai-gaku, which could both add a supplementary course of sanitary engineering for the older students. I feel sure that Mr. Ewing's efforts in that direction will be duly appreciated by the Government and that the Board of Directors of the university will be glad to make the necessary arrangement for this purpose.

Even in the middle and lower-class schools I should wish the simplest rules of life to be taught, as there is no more efficacious sanitary administration than the individual knowledge and appreciation of the value of the simple laws of nature in regard to human health. Enforcing ignorant people in health matters gives rise to disgust, antipathy and sometimes even revolt, while it does not give on the other hand the expected useful results. Any one interested in the promotion of the public health can help and must help, if one will see good results of Government measures, and education and instruction of the youth in the elements of hygiene will be by far the best means to promote the sanitary condition of the whole nation in a lasting manner. Japan has made enormous strides in the education of its people; the lower class schools are now remarkably well established, and the people eagerly send their children thither. From the poorest peasant child to the highest in rank all go to school in this country, and so I venture to hope that, in such a country where instruction is so highly appreciated, the first elements of the science of life will soon form an item in the school programme. Then the nation will become also more interested in health-matters, and such frightful epidemics which slaughter nearly 150,000 human beings within the space of one year, will gradually abate and become impossible.

I remain, respectfully yours,

A. J. C. GEERTS.

Yokohama, 27th May, 1880.

The following is a translation of the Government notifications in regard to the late reform:

### NOTIFICATION NO. 54.

It is hereby notified to *Kwan*, *Shio*, *In*, *Shi*, *Fu* and *Ken*, that the constitution of the Central Board of Health has been

enacted and that the functions that have been assigned to it are as it is found in the document hereunto annexed.

(Signed.) SANJO SANETOMI,  
Daijo-Daijin.

27th day, 12th month, 12th year Meiji,  
(27th December, 1879).

#### Constitution of the Central Board of Health.

The Board shall be constituted of the following officers, viz :  
One President, one Vice-President, and thirteen fixed members viz :

Eight medical men  
One chemist.  
One civil engineer  
The director of the Central Sanitary Bureau  
One secretary of the Home-Department  
One officer of police.

The president and members shall be specially appointed by the Government.

The vice-president shall be elected by the members by vote among themselves.

The president shall conduct the deliberations of the Board as regulated by its constitution and bye-laws, and shall report its conclusions to the Minister of Home Affairs.

The vice-President shall in the absence of the president act as president of the Board.

The members shall consider all questions laid before the Board, conformably to the provisions of the constitution and bye-laws.

Clerks shall be appointed to take charge of the recording of the proceedings to the meetings, of the drafting of documents, of accounts, translations, etc.

#### FUNCTIONS OF THE BOARD.

The Board shall be under the control of the Minister of Home Affairs, and shall deliberate upon all sanitary matters, interesting to the welfare of the empire.

The Board shall discuss, previous to their issue, all notifications of the central Government, relating to sanitary matters.

The Board shall have power at any time, to make inquiries into the various sanitary matters of the local Governments, and to appoint and send proper persons upon the business of inspection.

The conclusions of the Board shall all be reported to the Minister of Home Affairs.

The Board shall meet at least once in every month. Extraordinary meetings shall be held at any time at the bidding of the Minister for Home Affairs or of the president, or at the request of three or more members.

The presence of more than half of the members is required to form a quorum.

When any business comes up before the Board, at the motion of two or more members, the same shall be discussed, and any resolution adopted shall be submitted to the Minister of Home Affairs as the will and opinion of the board.

All decisions of the Board that are to be made public, shall be published bearing the name of the Board.

The rules of proceedings and the bye-laws of the Board shall, before adoption, be subject to the approval of the Minister of Home Affairs.

#### NOTIFICATION No. 55.

It is hereby notified to *Fu* and *Ken* that the Regulations for the District Boards of Health have been enacted as per documents hereunto annexed.

(Signed.) SANJO SANETOMI,  
Daijo Daijin.

27th day, 12th month, 12th year Meiji,  
(27th December, 1879.)

#### REGULATIONS FOR THE DISTRICT BOARDS OF HEALTH.

These Boards are instituted for their attendance to matters relative to health, and for their assistance to the governor of the *Fu* or *Ken*, in the preservation and promotion of the health of the people, living under his jurisdiction.

The Board shall consist of the following members viz :

Three or five medical practitioners.  
Three members of the local assembly (*Fu-kusai* or *Ken-kusai*.)  
The superintendent of the local government hospital.  
The chief chemist of the local government hospital.  
The director of the local sanitary bureau.  
One officer of the police.

The Board shall be under the control of the governor, who shall appoint the members thereof.

Note.—The medical practitioners shall, however, be elected by the members of the local assembly from among those living within the jurisdiction of such *Fu* and *Ken*, and the three members of the local assembly shall be elected by the delegates thereof, from among themselves.

The governor shall be the president of the Board : the vice president shall be elected by the members from among themselves.

The term of service of the members shall be two years, at the end of which they shall be re-elected afresh.

Note.—They are however re-eligible.

Besides the members one or two clerks shall be appointed to discharge the various minor duties of the Board.

Members of the Board shall receive no salary. In case any of them should reside at a distance of more than three *ri* from the place at which the meetings are held, they shall receive an adequate sum as travelling expenses, and proper remuneration may be given to those members who hold no other official position and who receive no salary from the Government.

The Board shall meet at least once in every month.

Note.—However, in the event of an emergency arising, or of pressing business, the members shall meet at any time at the president's call. Special meetings may also be held, when more than half of the actual members make a request for the same.

The principal matters for the Board to deliberate upon are :

1.—The practical mode of carrying out the sanitary laws promulgated by the Government.

2.—The drafting of local sanitary ordinances, to be issued by the *Fu* or *Ken*.

3.—Consideration of the business, laid before the Board by the governor, and of inquiries emanating from the Central Board of Health, the Central Sanitary Bureau of the Home Department, and from the sanitary officers of *Gun*, *Ku*, *Cho* and *Sen*.

The Board shall examine all reports on sanitary matters, made to the local government by the *Gun* and *Ken*.

The Board may suggest to the governor the taking of any practical sanitary measure expedient in its opinion.

Whenever the Board shall consider advisable the sending of qualified officers to inspect the sanitary condition of any locality within the *Fu* or *Ken*, it may so advise the governor.

All the proceedings of the meetings of the Board shall, without delay, be reported to the Home Department.

#### NOTIFICATION No. 55 (B) OF THE NAIMUSHO.

By the Notifications No. 44 and 49 (B), of last year, instructions were given that special officers should be appointed to take charge of sanitary matters within the *Fu* or *Ken*. Now a further notification is hereby given for the establishment of a local Sanitary Bureau and for the appointment of officers acquainted with the general principles of health-matters, in order that they may take charge of the duties mentioned in the document hereto annexed.

Note.—The constitution of each Sanitary Bureau in each *Fu* or *Ken*, should be drawn up in accordance with the following rules, and must be submitted to the Home Department for approval.

(Signed) HIROBUMI ITO,

Minister of the Home Department.

27th day, 12th month, 12th year Meiji.

#### TO THE *Fu* AND *Ken*.

#### DUTIES OF THE LOCAL SANITARY BUREAUX.

The local sanitary bureaux shall manage, in accordance with the existing regulations, all the sanitary affairs within the *Fu* or *Ken*, under the direction of the governor.

Matters that are newly broached or which require reformation, shall be put into execution, only after discussion and approval by the district Board of Health, and matters of great importance shall be submitted first to the Home Department, before being carried out.

The duties of the local Sanitary Bureaux are :

I.—Control over matters connected with medicine.

a.—Registering of every practitioner who cures or who quits the medical, pharmaceutical, obstetrical or veterinarian profession, and the framing of statistics showing the actual number of practitioners in each of these professions.

b.—To control the *dispensing, compounding* and sale of poisonous, powerful, falsified or adulterated medicines.

c.—To control the *dispensing, compounding* and sale of patent medicines.

d.—To give permission for post mortem examinations, if demanded by physicians, and the relatives of the deceased.

II.—Control over food and drinks.

a.—To examine the water supply in each locality, to inspect the quality of the water, the position of the wells or water-courses, the mode of cleaning the wells, and to prevent as much as possible all dangers for pollution of the drinking water.

b.—To control the sale of food and drinks and to prevent the sale of putrid, adulterated or unwholesome food or drinks.

c.—To control the sale of coloring matters, paints, dyes, powders, etc. used for coloring food, drinks, toys, clothing or articles for the toilet.

III.—Care for the public cleanliness.

a.—To take measures for the cleaning and repairing of streets, roads, drains, sewers, sinks, privies and for a regular removal of house refuse.

b.—To investigate the sanitary condition of schools, hospitals, jails, hotels, tenement-houses, theatres and other public buildings.

c.—To investigate the sanitary condition of factories,

markets, cattle-yards, slaughter-houses, places for drying fish, and other traffic.

d.—To determine the location of burial places and their boundaries, to establish regulations for burials and incinerations, specially in regard to the mode in which they ought to be carried out.

e.—To examine the nature of the soil in burial grounds, the construction of places of incineration, etc.

f.—To investigate hygienically the creation and preservation of public parks.

IV.—Measures for prevention of epidemic or infectious diseases.

a.—To take notice of the appearance of any infectious disease, such as cholera, typhoid fever, small-pox, measles, diphtheria, dysentery, etc., and to immediately take measures for the prevention of their spread.

b.—To inspect and regulate the mode of disinfection, and the isolation of patients suffering from infectious diseases.

c.—To determine the number and the location of lazarets for infectious diseases, to inspect the mode of treatment and nursing of the patients, and to regulate the disposal of the dead in the lazarets.

d.—To take notice of endemic diseases, of their classifications, of the nature of the ground, of the climate, and of the habits of the people in such localities where such diseases occur.

e.—To enforce preventive and repressive measures against the spread of epidemic or infectious diseases amongst cattle.

f.—To promote and encourage the diffusion of vaccination, the inspection of prostitutes and the proper treatment of venereal diseases.

V.—Medical provisions for the poor.

a.—To provide for, or encourage the establishment of hospitals, almshouses, and asylums (both public and private) for the blind, the deaf and dumb, insane persons and foundlings.

b.—To take measures for appointing special physicians to the various *Gun*, *Ku*, *Cho* and *San*.

VI.—Statistics and Reports.

a.—To register the number of births, miscarriages, and deaths, reported by *Gun* and *Ku* health-officers, and to make tabular and statistical statements semi-annually of the increase or decrease of the population, of the ages of the dead, and of the causes of death.

b.—To investigate and make tabular and statistical statements, semi-annually, of hospitals, almshouses, asylums for blind, deaf, mute, insane persons and foundlings, and also of such other establishments, both public and private, as have a similar character, of the number of physicians and their distribution in *Gun*, *Ku*, *Cho* and *San*, of the number of vaccinations performed and of the number of prostitutes inspected and treated.

c.—To make tabular and statistical statements, annually, of all who enter upon, or who quit the medical, pharmaceutical, obstetrical or veterinary professions, of the appearance or non-appearance of endemic diseases, of the number of manufacturers of medicinal chemicals, and of the increase or decrease of the sale in patent medicines.

d.—To make an annual report, stating all the particulars of the sanitary condition in the *Fu* or *Ken*, during the past year, together with such remarks and suggestions as seem justified.

e.—The above statistical tables and reports shall be forwarded to the Central Sanitary Bureau of the Home Department, at the stated times.

f.—To report immediately to the Central Sanitary Bureau of the Home Department the outbreak of any infectious disease, of any cattle plague, the cases of death caused by poisonous food, drinks, etc. and the establishment, the opening and closing of quarantine hospitals.

VII.—Miscellaneous.

a.—To observe and note the injuries to the health of the people, caused by their occupations and habits, and to provide for their gradual alleviation and improvement.

b.—To examine the quality of the mineral springs, to test the efficiency of the same for medical use, to take notice of the construction and installation of bathing places, of the mode of bathing, and to encourage every improvement in these matters.

c.—To investigate and to report upon native medicinal productions, the quantities in which and the localities where they are cultivated or obtained.

d.—To submit all the statistical tables and reports to the district Board of Health for reference.

e.—To collect from *Gun*, *Ku*, *Cho* and *San* any necessary information, when so required by the district Board of Health.

NOTIFICATION No. 56 (B) OF NAIMUSHO.

It is hereby notified that a local Sanitary Bureau having been organized in each local Government (*Fu* or *Ken*), some of the officers of this Bureau shall be appointed to take charge of sanitary matters in *Gun* and *Ku*. But unless support be given them by *Cho* or *San*, there are several measures which they will be unable to enforce. Therefore local sanitary committees shall be elected by the people, to assist the *Kucho* and the health-officer in managing the sanitary matters of the said *Cho* or *San*, conformably to the articles of the documents hereto annexed.

Note.—One committee may act for several *Cho* and *San* together. The manner of organizing the committees, the mode of working, etc., shall be submitted to the approval of the Home Department.

(Signed) HIROBUMI ITO,  
Minister for Home Affairs.

27th day, 12th month, 12th year, Meiji,  
(27th Dec., 1879.)

TO THE *Fu* AND *Ken*.

Duties of the sanitary officers of *Cho* and *San*.

1.—To register and report monthly to the *Guncho* or *Kurcho* all births, deaths and miscarriages.

2.—To inspect and to suggest the necessary measures for improvement in the mode of constructing, repairing and cleaning of streets, roads, wells, aqueducts, drains, privies, refuse-boxes, etc.

To give attention and to control hygienically the mode of constructing and of cleaning schools, hospitals, prisons, theatres, hotels, tenement-houses, bath-houses, hot-spring bathing establishments, brothels, etc., and to take such measures as will lead to their gradual improvement.

To examine and to improve gradually public market places, manufactories, workshops, places for raising and for slaughtering cattle, for drying fish and all other traffic which might form a nuisance or be injurious to health.

3.—To prohibit the sale of putrid fish, fowls, meat, vegetables, adulterated flour, unripe fruit, unwholesome salted food, etc.

4.—To examine the quality of drinking water, ice, milk and other articles used for drinking purposes, and to prohibit the sale of such drinks as are adulterated or dangerous to health.

5.—To control the compounding, the dispensing and the sale of poisonous, powerful, falsified or adulterated medicines. To control the sale of patent medicines and to prohibit the sale of such drugs as are used for provoking abortion.

6.—To control the sale of pigments used for the colouring of food, drinks, toys, etc.

7.—To inform the *Guncho* or *Kurcho* where burial grounds may be best located, to instruct as to the best mode of carrying out burials and cremation.

To examine the nature of the soil of cemeteries, the construction of the cremation-places, and to consider how such matters should be regulated, especially in times of the prevalence of epidemics.

To report to the *Guncho* or *Kurcho*, weekly, the daily number of burials and cremations.

8.—To notify at once to the *Guncho* or *Kurcho* whenever the local physicians report the appearance of infectious diseases, such as cholera, typhus, typhoid fever, small-pox, measles, diphtheria, dysentery, etc., whereafter the *Guncho* or *Kurcho* shall immediately order the carrying out of the necessary preventive and repressive measures. To report to the *Guncho* or *Kurcho* whenever a cattle plague breaks out and to take at once the necessary preventive measures.

9.—To propose to the *Guncho* or *Kurcho*, that the number of sanitary committees shall temporarily be increased, whenever an epidemic disease spreads; these committees shall be formed by means of election from the members of the *Cho* and *San* assembly.

To consider the proper mode of disinfection and isolation of patients, and to take charge of an efficient carrying out of these measures, in a manner proportionate to the prevailing disease.

To determine the place where to erect lazarets for infectious diseases, to examine and to take the necessary care that the patients are well treated in these hospitals, and that the dead are removed in a proper and decent manner.

To report to the *Guncho* or *Kurcho* the number of deaths, recoveries, admissions to and discharges from the hospital.

10.—To look after children who were not vaccinated and to promote a general diffusion of vaccination.

To induce the people to submit to a revaccination, whenever small-pox disease becomes unusually prevalent.

To collect tabular statements of the number of vaccinations performed by the local physicians, and to submit these statistics to the *Kucho* or *Guncho*.

11.—To make tabular statements of the number of inspected prostitutes, in such *Cho* and *San* where an inspecting station exists, and to report the number of those suffering from venereal diseases, monthly, to the *Guncho* or *Kucho*.

12.—To observe and to report to the *Guncho* or *Kurcho* the existence, the classification and the number of patients suffering from such endemic diseases as leprosy, kakké, ague, etc.

13.—To appoint local physicians and to secure the gratuitous treatment of the poor, in accordance to the local means and to the decisions of the *Cho* or *San* assembly.

14.—To observe such kind of clothing, food, houses and habits which are injurious to the health of the people; to report to the *Guncho* or *Kucho* concerning the same, and to cause a gradual improvement in such matters.

LONDON, 24th May, 1880.

Parliament was opened to-day by Royal Commission. The Premier made a statement concerning the affairs of Europe, which he characterised as not being critical. The strike of the Blackburn weavers has ended. Work was resumed upon the old terms.

LONDON, 26th May, 1880.

The Derby has been won by *Beud Or*:—*Robert the Devil* second, and *Mask* third.

## The Japan Weekly Mail.

'FAIS CE QUE DOIS; ADVIENNE QUE POURRA.'

### NOTICE TO CORRESPONDENTS.

No notice will be taken of anonymous correspondence. Whatever is intended for insertion in the JAPAN WEEKLY MAIL must be authenticated by the name and address of the writer, not for publication but as a guarantee of good faith.

It is particularly requested that all letters on business, relating to Advertisements, Job-printing, or Accounts, be addressed to the MANAGER.

And that literary contributions of every description be addressed to the EDITOR.

YOKOHAMA: SATURDAY, MAY 29th. 1880.

JAPANESE ENA 2540, NIKKI 13TH YKAN, FTH MONTH, 29TH DAY, DO-YO-SI.

### NOTES OF THE WEEK.

The P. M. S. S. *City of Peking* arrived on Monday last with San Francisco dates to May 4th. The homeward mail was despatched on Friday morning, per M. M. steamer *Volga*.

Reference to the latest traffic returns of the Japanese railway lines in operation shows a very considerable increase in the present income, as compared with that derived in a corresponding period last year. On the Tokio-Yokohama section the receipts for the week ending on the 23rd instant were 10,864.05 yen, an increment of 1,066.27 yen over the revenue of the corresponding seven days in May last. On the Kobe-Ootsu section the figures stand, for the two periods, at 19,521.89 yen and 13,180.61 yen respectively. It is true that on the latter line the number of miles now open is 55, while at this time in 1879 there was traffic over only 47 miles; but the percentage of increase is still considerable. In both cases the Railway Department may fairly be congratulated upon the addition to its business.

Between the 3rd and 26th of April the following vessels sailed from New York to the Far East:—April 5th, *John M. Clerk*, for Hongkong with 23,800 cases kerosene; April 20th, *Panay*, for Yokohama with 240 gals varnish, 107 pkgs glassware, 4 cs books, 1 cs paper, 1 pkge mfd wood, 1 cs organs, 1 cs clothing, 250 kgs nails, 450 lbs mf tobacco, 12 pkgs paint, 114 tons coal, 28,551 cs kerosene, 15 pkgs hardware, 3 do twine, 80 do drugs, 100 cs blacking, 785 pkgs clocks, 19 cases ir goods, 100 bbls sugar, 389 pkgs lamps, 16 cases pencils, 6 do saw machs, 56 pkgs rope, 5 do wick, 26 do mf iron, 90 bales domestics, 14 cs cd goods, 2 carriages, 40 cs ptg ink, 20 cs disinfectants, 33 cs brassware, 10 cs extract, 1 box leather, 70 bbls alcohol, 10 cs furniture, 1 i safe, 1 cs cigarettes, 2 cs notions, 9 pkgs machy, 200 bbls rosin, 200 gals lub oil, 300 lbs wax; April 23rd, *Waltkyre*, for Yokohama and Hiogo with 27,859 cases kerosene; April 26th, *Paul Jones*, for Shanghai with 28,138 cases kerosene. The *Cavalier* also sailed for Anjer on the 3rd of April with 24,600 cases. One vessel only was on the berth at latest dates, and that was for Shanghai.

The *London and China Express* publishes the following extracts from a letter written by Mr. W. G. Howell to the *Globe* in reply to an article in the *New York Times* on the subject of the Shimonoseki indemnity:—

The Straits did not pass through his (the Daimio of Choshu) territory, but he possessed one side of them, and, with the view of spitting the Tycoon, and embroiling him with foreign Powers, he declared them closed, and refused to allow foreign vessels to pass through them. He had not a shadow of right to take this course, which was an act of open rebellion against his suzerain; but when representations respecting it were made to the Ministers of the Tycoon, they confessed that, much as they deplored

the fact, they were not powerful enough to chastise their rebellious feudatory, and compel his obedience. The Treaty Powers therefore took the matter into their own hands.

The expedition answered the desired end: Choshu was forced to submit, and a fine of \$3,000,000 was imposed on him. To this expedition Great Britain contributed nine ships of war, France four or five, the Netherlands three, and the United States a small chartered trading steamer, manned with a lieutenant's party, and carrying one gun. It is no source of reproach to the United States that they had no naval force in the Japanese waters; but as a matter of fact, they had none, and took the only means at their disposal of showing their concurrence with the course pursued by the other Treaty Powers. Though some of the Powers concerned were anxious that the money should be paid according to the covenant, England was more anxious for some commercial equivalent, particularly the early opening to trade of the port of Hiogo and the city of Osaka. The Japanese, however, did not see their way to this, and after nature deliberation elected to pay the money.

At the division the United States Minister in Paris where the matter was being discussed for convenience sake, contended that as the general co-operation of all the four Powers must necessarily have had great and equal weight, if not in the operations, at all events in the measures which preceded them and afterwards in turning the result to good account, it would be fair to look upon the several Powers as contributing in an equal degree to the success of the common cause, and therefore as entitled to share equally in the indemnity which the Japanese Government agreed to pay. This view was accepted, France benefiting by it more than under the principle suggested by her own Minister, while Holland, and the United States especially, derived even still larger advantage from it. England alone was required to make a sacrifice, but she did so—I venture to think with equal dignity and grace.

It is not too much to say that the "smartness" of the principle of division suggested by the American Minister, and conceded by the other Powers, greatly shocked very many excellent American citizens. They felt that they had little or no business with the money, and to do them full justice, they have never since been comfortable about it. England from the very first, although put to far heavier expense than her share of the indemnity covered, has made repeated, I might almost say ingenuous, efforts to induce the Japanese to give commercial equivalents for the covenanted indemnity. She delightedly agreed to defer the payment of the latter instalments for five years, and would only have been too willing to forego the acceptance of every dollar of her share of it had even the shadow of an excuse been given her for doing so. But where she was, pecuniarily, a heavy loser by the adopted principle of partition, the United States Government could hardly have been at the expense of \$10,000. It actually received \$785,000, and the American people are right in thinking themselves bound to restore this. . . . Having said this much, I may safely leave the question of how far the writer in the *New York Times* has done well in vilifying the action of the British Government and the British Minister in Japan, or in recording to "the everlasting credit" of his own Government the restoration to the Japanese of a sum of money which it argued some bluntness of perception to claim, and a very sturdy moral digestion to have retained so long.

The *San Francisco Chronicle* gives the following account of the murder of its principal proprietor:—

At 8 o'clock last night, April 23rd, Charles de Young walked into the business office of the *Chronicle* and engaged in conversation with Edward Spear and E. B. Read, who had been attending to some business. He stood with his back to the counter, facing the Kearny street door, and was engaged in conversation with the gentlemen named, when the swinging door in front of him was quickly and suddenly pushed open, and Isaac M. Kallloch, son of I. S. Kallloch, Mayor of the city, rapidly entered, drawing a revolver before he was fairly inside the door. Mr. de Young caught sight of Kallloch and the pistol at the same time and ran toward the gate at the end of the counter. As he did so Kallloch fired at him, and fired again as he reached the gate. Neither shot took effect, and Kallloch fired again as Mr. de Young turned to the left and placed the counter between himself and his assailant. He was stooping behind the counter, when Kallloch reached over, placed the pistol within a foot of his face as he was looking upward, and fired again, the ball striking Mr. de Young in the month. Mr. de Young then drew his pistol and staggered to a desk about three feet distant, when Kallloch fired a fifth shot. Here Mr. de Young attempted to raise his pistol, but failed, owing to weakness. Kallloch then turned and fled to the door. Mr. de Young a moment afterward staggered backward a step, fell into the arms of Elias de Young, who was a few feet distant, and became unconscious, the blood gushing in a stream from his mouth. He was placed upon the floor and medical attendance was instantly summoned, but ten minutes afterward,

despite medical efforts, he was a corpse. Kalloch, upon running out of the door, encountered officers Peckinpaugh and Ward, who took him in custody. He was immediately taken to the City Prison and placed in Tank No. 4 of the New Prison. He said nothing whatever on his way there and maintained a stolid silence afterwards. The first shot that he fired pierced the east door of the office; the second struck the wall and bedded itself in the window-sill; the third passed through Mr. de Young's hat and lodged in the woodwork, and the fifth passed through the window of the private office of M. H. de Young and entered the wall. The fourth shot struck Mr. de Young in the mouth and ranged backward through the brain, producing unconsciousness and death almost immediately. In a few moments the office was filled with the friends of the deceased who had heard of the tragedy, and a tremendous throng gathered outside the office on Bush and Kearny streets. Coroner Dorr arrived at a quarter to nine and sent for his deputies. The dead waggon arrived shortly afterwards with a coffin, the remains were placed within it, and the dead body was removed to the Morgue. A hasty examination of the body showed that the ball had pierced the upper lip and ranged straight backward. The face was filled with powder-grains, which the nearness of the pistol blow into the skin. The third shot pierced the hat of the deceased, passing close to the head.

There were present in the office at the time of the murder Dr. Charles F. Potter, who was conversing with the advertising clerk, William Dreyppolcher, at the desk; and R. E. Douglas, advertising solicitor, who was sitting with Elias de Young, the half brother of the deceased, who caught him where he fell. The three employees were witnesses to the shooting, as was Mr. Potter, who dropped beside the desk upon the firing of the first shot and crawled along behind Kalloch.

The *Bulletin*, at a late hour last night, issued an extra in which the following was given as the alleged cause of the shooting:

The provocation for the shooting was the issuance of a book of sixty pages, on the title page of which is printed the following:

Only Full Report of the Trial of Rev. I. S. Kalloch, on Charge of Adultery—A Full History of the Affair—Doings of the Church—Kalloch's Pulpit Experience—Arrest—Arraignment, Trial and Result, with Accurate Portrait of Kalloch, and the Beautiful Lady in Black, and the Bedroom of the Lechmere—Boston, 1857.

The deceased only yesterday afternoon stated to the Managing Editor of the paper that he had been greatly annoyed by notes addressed to him, requesting him to send a copy of a pamphlet reflecting on Kalloch. That after some trouble he had succeeded in obtaining a copy that had been sent to a gentleman in this city. He expressed a fear that the circulation of the document would do him an injury and perhaps prejudice his case before the Court, as its publication might be attributed to him, and expressed the hope that there were not many of them in existence.

The correspondent of a Madras paper suggests that all native murderers, or those making attempts at murder, shall be punished, whether secured alive or dead, by hanging them for 24 hours on a gallows, with a pig's skin round their heads. Were this done, he thinks, all attempts at murder in Afghanistan would very shortly cease, because the natives dread contamination from swine more than death itself.

We understand that the United States Minister has confirmed the sentence of death recently passed upon John Martin Ross, found guilty of the murder of Robert Kelly on board the American ship *Bullion*. The sentence will not, however, be carried into effect until the result of the appeal to the Home Courts is known.

We are informed that, in accordance with a despatch received yesterday from the Ministry of Ports and Telegraphs, the hour of departure of the steamers of the Messageries Maritimes will be nine instead of seven o'clock as heretofore.

Any one who has watched the gradual falling off in appearance of the houses in Tsukiji, and more especially those who have had to pay for repeated repairs caused by the weather having got at the wood from the insufficiency of the paint covering applied, will receive with welcome the new asbestos paints now being introduced to this market by Mr. Thomas Seon. Owing to the distance that many people live from skilled labor in the newly settled States of America, and the expense incurred for putting on a coat of paint every year, the American paint manufacturers and the chemists in their employment, have for some years past devoted all their energies towards perfecting some form of prepared coloring matter which would be ready for use just

as supplied from the factory without any further mixing, and yet possess such properties as not to require renewal for a long space of time. This desideratum is said to have been achieved better by H. W. Johns of New York, than any other manufacturer, and his asbestos paints have attained a very wide and well deserved celebrity among those who are the best judges in such matters, viz:—the consumers. This fact is evidenced by the enormous quantities of their paints used at home and exported, and the consequent rapid spread of the firm's business. There are twelve standard shades of the asbestos paints, comprising every colour suitable for the tasteful decoration of all classes of buildings, and for general purposes. They are prepared ready for use in packages of various sizes to suit consumers, and are unexcelled by any in the market for richness and permanence of color, and durability as a protective coating for exposed wood or iron work. They are said to differ from all other prepared paints in containing no water, and by actual tests two coats of these paints are claimed to have proved equal in body to three of the diluted paints, while the price per gallon is the same or less. The firm also supplies a strictly fire-proof paint in light tints, put up in kegs and barrels ready for use, which ought to gain special favor in this country where fires are of such frequent occurrence, and danger from sparks in a gale of wind is so excessive. A good example of the excellence of the new material is afforded by the school house in Tsukiji, which Mr. Seon has recently painted for the American Mission, the roof of this building being covered with the patent asbestos roofing for which he is sole agent in Japan. We are informed that any person can apply the paint after a few minutes' instruction, a fact which goes far to enhance its value here.

A correspondent of the *Daily Mail* writes as follows:—

As it may be interesting to some of your readers to know what sort of a queer fish was recently exhibited by the Japanese and called by the local papers a wonder of the deep, I venture to give its classification to prove that all lovers of caviare have swallowed a good many of them in embryo, that it is anything but a wonder, and simply a straggler who might have lost his dead reckoning or else paid a visit to Japan out of caprice. It is the Beluga sturgeon of the Russians and inhabits nearly all the large rivers of Siberia, probably those of Northern China, and also the Volga and Caspian Sea. It was classed in the Berlin Zoological Museum, by Professor Lichtenstein, as follows:—Class, Pisces, Series II. Chondropterygii Genus I. Accipenser, Subgenus Accipenser Caspiensis. The only difference between this subgenus and the sturgeon of Northern Europe consists in its having a rounded muzzle, while the latter is formed more like a shovel.

The Siberian line, and also the line between Tokio and Hakodate, are in good working order; but the interruption on the Shanghai-Amoy cable still continues.

Some of our local linguists may be pleased to learn that a society has just been formed at Berne under the following short and euphonious title:—"Der Kunstighinsichtmehrberein-underbegrussenwiebishergewöhlichenhutoderdiemützabnehmenderincommodirenwollender-Verein." The members can hardly contemplate pronouncing the whole name of their club in the "wee sma' hours" unless it is conducted on strictly temperance principles.

It is to be hoped that the courageous action of Mr. Clifford, the 2nd officer of the *Pym*, in jumping overboard in a heavy sea, and endeavoring to save the life of the unfortunate carpenter whose death has formed the subject of an inquiry at the British Consulate, will meet with due recognition. Conduct such as that of Mr. Clifford is as worthy of reward as any feat of valour on the battle-field. We trust, therefore, that the facts will be brought under the notice of the Humane Society.

The New York correspondent of the San Francisco *Bulletin*, writing on the subject of Mr. Edison's latest sensation, says:—"Does any one want to invest in Edison's grand scheme for getting \$1,400 worth of gold out of every ton of tailings to be had? If so, there is plenty of company's stock to be had in New York. It is to be noticed curiously enough, that men of

science are just as sceptical about this new affair as they were about Edison's electric light. In the meantime, while waiting for the millions of tailings, Edison is making money by selling what he calls his polyphorm, a preparation warranted to cure neuralgia. I do not know whether or not it is any better than the general run of patent medicines advertised, but it is sure to sell for it has had free advertisements without end."

The great sale of Prince Demidoff's collection has attracted much attention in Europe from the multitude of valuable objects of art contained in it. Mr. Vanderbilt invested largely, so that some of the choicest gems go to America. Writing of the sale an exchange says that "one of not the least curious and interesting corners of the Palace of San Donato is the Imperial chamber dedicated to the memory of the Bonaparte family, and filled with objects of interest relating to that great house. There is to be seen a splendid study by Canova of the Prince Pauline Borghese, the 'Petit Caporal's' youngest sister, a ring of the hair of Napoleon I. when a child, and a paper-weight made of a piece of stone from the tomb of Napoleon at St. Helena, the cockade worn by the Emperor on his return from Elba, a tooth of Napoleon I. given by Madame Mère to Jerome, King of Westphalia, and snuff boxes, pocket handkerchiefs, rings, and even a pair of breeches belonging to the founder of the Napoleonic dynasty! Surely it would be worth the while of Madame Tussaud's agent to take a trip to Florence, for all this goes to the hammer."

#### PARIS LETTER.

PARIS, 27th March, 1880.

M. Pasteur, who gives most agreeable soirées, cures lions of chicken-pox and cholera-morbus by vaccination. M. Daubrée, another social savant, can make tiny celestial boulders. M. Hannay can manufacture diamonds and keep them in a goose-quill for a jewel case. M. Réan admits that the time is coming when creation will create its creator. Another learned man believes that we shall all have to seek refuge in Central Africa to escape the invasion of polar cold; and M. de Foinville, after demonstrating our natural descent from tadpoles, through oysters—animals that can be crossed in love, frogs,—and the man and his brother monkey, has no doubt that we shall emerge into another more advanced organism before the lease of our planet's existence expires, viz. 400 millions of years from the present date. But these are small accomplishments in comparison with the doctrines and doings of Mlle. Duclerc. This young and strangely gifted woman holds weekly meetings to advocate both the equality and superiority of the female *census* the male sex. She proclaims that the degeneracy of her sisters, as illustrated in their going to church and praying, is the natural consequence of their not being allowed to vote for town-councillors and members of parliament; that to ensure their being dutiful wives, and fond mothers, excellent house-keepers and true friends, the panacea lies, not in Pandora's, but in the ballot-box. Much excuse must be made for the return of spring—particularly after such a winter as we had—which, doctors say, sends the blood coursing rapidly through all the lanes and alleys of the system—the head not excepted. Were this lady not a free-thinker, severe fasting might reduce the pretty apostle, in black merino and spotless linen, to a sounder state of mind, but this would injure her chances for the governorship of Algeria, since Mère Michel, at present in New Caledonia for reasons of state, is the heir-apparent to the Presidency of the Republic. A statistician has calculated that, whereas seventy per cent of the population "kept Lent" in the orthodox sense ten years ago, not fifty do so now. I think the concentrating of official balls during the forty days period has much to answer for. During the supper at the last ball at the Elysée, at one o'clock on the morning of a Friday, there were no guests who displayed a preference for a slice of salmon over a wing of a chicken, galantine or truffled game. Where the sinners are ladies, they will, after a few hours repose, replace white satin and valenciennes by black sicilienne and cashmere, with lace flounces and a profusion of jet, and off to church. If it be Sunday, the sermons of the Rev. Mr. Didon are preferred. The crowd is greatest when he preaches; for it has got abroad that this young and sturdy Dominican is about joining Père Loyson's growing section of Old Catholics; but enough of the latter will remain attached to the Pope, to judge by the attendance at the churches on Palm Sunday, and the sale of cart-loads of box, which is sold in sprigs and bouquets to suit all persons; the purchaser then has his or her provision blessed, and it is then treasured up in bed-rooms or wreathed round the photos of those gone to the great unknown land. These recurring ceremonies, though always old, are ever new, and we like to see them; what we are ignorant of we may be excused for deploring. Hence the promenade to Longchamps during Holy

Week, to show off all that was new in the fashions for both sexes is as unknown to Parisians of to-day, as a Bourbon king. The famous Convent oratoria is replaced by chamber concerts which vary from being excellent to execrable, and from paying to gratuitous. The churches on Thursday celebrated several first-class musical masses. Rossini's *Stabat Mater* is the favorite. It is at Notre Dame, however, that it is necessary to attend if one desires to witness the ceremony of the Passion. The cathedral, naturally gloomy, is rendered more so by the very few lamps lighted, the emblems of mourning around, and the solemn plaintiveness of the organ and the wailing notes of the choir. Under these influences the most obdurate heart must feel touched by the agony of Him in whose memory the ceremony is celebrated. Indeed, all the churches deserve to be visited at this period. From Good Friday up to Easter Sunday morning the altars are deprived of all their gorgeous ornaments; the inside of the buildings hung with black. Many of the side chapels represent the crucifixion in life-like figures, and Christ lying in the tomb is positively emotional, and as each visitor is presumed to bring an appropriate bouquet and deposit it round the sepulchre, the effect is very imposing. During the three days the bells, as usual, are presumed to have gone to Rome to be blessed; or, in other words, they remain silent till Easter Sunday morning, when their merriest peals summon the faithful to rejoice. No public places of amusement remain open on Good Friday, save those that give sacred concerts: they are well patronized. This day is the sole holiday which the butchers take in the year, and even it is not a day of rest, as it is devoted to a thorough cleansing of premises and repainting of fronts. The Rev. M. Loyson delivered a series of lectures on the Passion, which were well attended and acceptable to Christians of every denomination. At the close of one of these, he solicited contributions for the support of his church: he required fr. 8,000 to pay off debts. This surprised not a few, as it was generally supposed he was endowed by the English Evangelical Society: this appeal explained the meaning of a neat envelope placed on each seat addressed to the Treasurer of the Church; inside was a card and pencil, on which the charitable could write down what sum they desired that the collector should call upon them to receive; the amount was nearly then and there subscribed. In order to meet all tastes, or rather all consciences, the daily journals of a certain class are in the habit of publishing dinner bills for those who do not. A free-thinker might not refuse the former; among its infinite variety of good things, but limited to every kind of fish, the choicest wines, and all the delicacies of the season in the way of fruits and vegetables. The table itself has also its most beautiful services, and the rarest flowers not only in the form of bouquets, but in zig-zag garlands round the spaces set apart for the dishes. Who would not like to "fast" on the following? Soup of vegetables and Parmesan cheese; patties of oysters and cream; carp, sole, salmon; "plover"—note the fact, for it is not a prohibited meat; caviare and plovers' eggs, truffled salmon pie, asparagus, ices, creams, and strawberries. The classes who thus abstain feel in duty bound to drive to church in their gala coaches, attended by powdered servants, while—as a type—the lady herself descends from the vehicle dressed in the plainest black, the shape as well as the bonnet recalling fashions twelve years old. Under no circumstance would any lady moving in society appear in a colored toilette during Holy Week. Those mothers, whose daughters are at Convent schools, assist at the religious ceremonies in these institutions, where the pupils, in long white veils, sing the mass, and are assisted by the graver voices of the nuns. As there are said to be arrangements even with heaven, a young lady while in "mourning" can select rich materials, provided they be black, but no ornaments are to be worn, and it is questionable if the bouquet of violets that peeps from a corsage be quite in its place. Among the most noteworthy changes in the general fashions, the jacket appears to have ceased to reign; the most preferred corsages are pointed in front, rounded on the hips and forming *postillon* behind: thus producing a voluminous appearance, and as the basque remains almost horizontal, we are thus brought back to the eighteenth century. Paniers have failed, and after the shepherdesses of Watteau and Florian, fashion reverts to the *nudes* of the Revolution and the reign which preceded it. The "visita," which are "short," have nevertheless a rival in the seductive mantelet. This has a large collar either in lace, jet, or satin; it fits tightly to the figure and closes in front. This mantelet and a *capote* hat—the shape still most in favor here—will predominate during the spring. The front is in Italian straw; the crown in surah; behind and above the *baculet* is a large golden ball, kept in position by a gold ring; on the left side is a sprig of lilac with leaves, just as if it had been freshly cut; the strings are in surah with ends in gold-spangled lace; heliotrope and *merveil-leux* surah are most in request, the latter especially. They have only one competitor to fear—iris silk gauze. Indian cashmere is in much request for ceremonial toilettes; and shawls are worn draped. As to patterns, the "spot" design in various colors is general, and also the new *damasquiné* tissue, where thousands of small lines cross and recross. Ivory colored satin is a favorite at soirées; all kinds of lace are receiving the saffron

color; parasols have appeared; they are always long and fine and in harmony with toilettes; they are edged with fringe or lace. The mania still reigns to match all parts of the toilette: the hat recalls the robe. Feathers will be renounced this season—they were too much abused during last—but instead, flowers, herbs, lace, and delicate tissues will dominate: the young and pretty *élégantes* decidedly refuse to patronise the flat coiffure. Instead of wavy bands, ever graceful, there are diadems of curls, and very voluminous and elevated chignons.

An old lady, who has not a wrinkle on her charming face states, that these can be cured, and that they are not necessarily the result of age, but come also from habit or sorrow; she recommends a pomatum composed of two ounces of the juice of the bulbs of white lilies, the same quantity of honey, and one ounce of pure white wax. If this confection is gently applied morning and evening the blemish will disappear.

The very successful ball given at the Chinese Embassy, and the popularity which Verdi's Opera *Aida* enjoys, are making their influences gradually felt in colors and materials: yellow, blue, and black, are favorites with the "heathen Chinese," and black and red with the Egyptian. At the Chinese ball the ladies' toilettes were uniformly excellent—a capital test of a soirée, and the proceedings were very gay; the native attachés proved very gallant fellows, and breaking through all habit, accepted ladies' invitations to dance. The conservatory, one of the prettiest in Paris, was deliciously cool, and filled with beautiful flowers, and a *playing* fountain. The opera of *Aida* is dazzling in its gorgeousness. It is being represented at the Grand Opera, where all is sumptuous and grand: Verdi conducts the orchestra himself. I have heard the opera in Italian and as at present in French, with all scenic accessories, and there can be no question that the latter representation is the superior. Mlle. Krauss, as *Aida*, was perfection, and Manuel, as *Rhadames*, was her fitting partner. They made burying alive lovely. Mlle. Marie Van Zandt, aged eighteen, and the friend of Patti and Nilsson, made her first appearance in *Mignon*, the pretty opera of Ambroise Thomas. She has a fair soprano voice, that can be made charming by cultivation, as the best judges are of opinion. She is slender and small, with a melancholy expression of features, and brown hair. She has a splendid future before her, and her mother, who is an artiste herself, will doubtless see that the opportunity shall not be lost.

The picture show is commencing to cause much activity in the artistic world; the number of ladies who have entered their works for European admiration—and purchase—is larger than in preceding years, and the present Government has shown itself more liberal in the way of admissions, a certain proportion to the stronger sex only being allowed. Indeed the Republic is very gallant, as it bestows not a little patronage on female talent generally. The Persian ambassador gave his annual spring reception on the 21st of March, the guests received sweetmeats, sherbet, and flowers; his lady was once a very handsome creature, but she is becoming very full indeed in habit, and, as she is rather small, the change is not to her advantage.

The corporation of Paris, instead of giving out children left to their charge, to be nursed by peasants, contemplates erecting a hospice or special baby city, with a farm to supply milk from cows and goats. It was stated during the discussion, that the infant mortality, with official nurses entrusted to rear children by the bottle, did not arise from bad milk or any inherent disease of the children, but simply from the improper state in which the bottles are kept; their filthiness turns the milk which in this condition can explain endless complications.

### JAPANESE NEWS.

[The following Notes on various Japanese matters are chiefly derived from the native papers, occasionally supplemented from original sources of information, and are carefully collated and edited, so as make them readable and intelligible.]

#### COURT, POLITICAL AND OFFICIAL.

His Majesty the Emperor visited the Fukiage Park, on Tuesday last, and witnessed the horse-races held under the auspices of the officers belonging to the Imperial Guard and garrison.

A native paper gives currency to a rumour that, owing to cases of cholera being reported from different localities, His Majesty's visit to the provinces will be indefinitely postponed.

Tokugawa Keiki, the ex-Shogun, was raised to the senior rank of the 2nd class on the 18th instant.

His Excellency Oki, Privy Councillor and President of the Senate, entertained several of the Princes of the Blood, the Prime Ministers, the Privy Councillors, the members of the Senate, the Foreign Representatives, and other prominent gentlemen, in all about three hundred guests, at his private residence, on the 22nd instant.

It has been announced that the new French Minister will leave Paris for Japan, early next month.

Koso Kinkoshii, *Sungii*, has been appointed Ambassador from the Korean Government to the Court of Tokio, and will leave for Japan early next month. His departure has been so postponed on account of the death of one of the Royal Princes of Corea, a short time since. Among other objects which will occupy the Ambassador's attention is the completion of a loan of 60,000 yen, which the Korean Government has arranged with a Japanese firm, the "Kiodosha." All the preliminary arrangements have already been made.

We (*Mainichi Shimbun*) hear that His Majesty the Emperor will shortly call upon His Excellency Terashima, at his private residence.

Kwazoku Hachianka, Superintendent of the Custom House Bureau in the Finance Department, inspected the Yokohama Custom House on the 24th instant.

Mr. Watanabe, Governor of Fukuoka, arrived in Tokio recently on official business.

Mr. Takesuye Shinichiro, Under Secretary of the Finance Department, has been appointed a Consul, but his post is not yet announced.

Friday last, the 28th instant, being the anniversary of the birth of Her Majesty the Empress, was celebrated with rejoicing in the Imperial palace. The Princes of the Blood, the Prime Ministers, the Privy Councillors, and the Choku-nin and So-nin of the Imperial Household Department, attended at the palace in full uniform to offer their congratulations, and then received the customary offerings of *saké* and *sakana*.

General Nazu has been replaced in the Imperial cortège during the approaching Imperial progress, by General Miyoshi.

The additional buildings to be erected for the accommodation of the Daijo Kwan are estimated to cost about 30,000 yen.

His Excellency Shinagawa, Vice Assistant Minister for Home Affairs, left Tokio the day before yesterday for the Shimosa Farm, on a tour of official inspection.

The Judges held a meeting at the Dai-shin-in, on the 27th instant.

A meeting of the Central Board of Health is to be held yesterday.

The *Nichi Nichi Shimbun* writes that a conference has been held between the Governor of Tokio and the Chief Police Inspector, regarding a system to be established for the relief of distress. Crime has been on the increase latterly, in consequence of the prevailing high price of rice.

### NAVAL AND MILITARY.

A powder magazine is to be built near the head-quarters of the Imperial Guard within the palace grounds.

The first battalion of the Hiroshima garrison has been marching through the prefectures of Shimane and Yamaguchi since the end of March, and practising field manoeuvres. It returned to garrison on the 13th instant. The second battalion started for the provinces of Bizen and Bingo on the 15th instant.

The engagement of M. Dagron, *Chef de Musique* of the War Department, expires next month, but as the military bands are not yet completely organized, his stay in Japan will be prolonged.

There have been over one thousand candidates for admission into the Kiododan (Military School) this year.

General Miyoshi, who recently returned to the capital from Osaka, attended at the War Department on the forenoon of the 21st instant, and had an interview with His Excellency General Oyama, Minister of War.

Lieutenant-General Shijo, formerly commander of the Nagoya garrison, arrived in Tokio on the 21st instant, and has left for his new post in Sendai.

Three torpedo boats, have been construction at the Yokosuka dock-yard.

Two regiments of the second brigade of the Tokio garrison are to proceed to the province of Boshu in a day or two to practise field manoeuvres, and the third battalion of the third brigade of the same garrison will start about the same time on a March through the provinces of Shinshu and Koshu with the same object.

A powder magazine is to be built at the rifle range at Muku-gaoka, belonging to the Police Department.

## INDUSTRIES, TRADE AND FINANCE.

Forty thousand koku of rice from the province of Bitchu were stored in the Asakusa godown, in Tokio, a few days ago, and are shortly to be sold by tender.

Chinese rice does not meet with ready sale in the capital.

A native juuk, laden with thirteen thousand bags of rice from the provinces of Owari, Kaga, Ise, and Nambu, and six hundred bags of beans, arrived at Shinagawa on the 20th instant.

The climate and soil of the prefecture of Okinawa (Loeshoo) being very well fitted for silk-worm breeding, Mr. Tajima of Saitama Ken, and Mr. Uyehara of Nagano Ken, are going to establish a silkworm breeding company in the southern prefecture.

A society has been formed at Sapporo, Yesso, under the name of the *Kaikosha*, with a capital of 20,000 yen, for the purpose of bringing waste land under cultivation.

Until the time of Godaigo Tenno, the salt mines in the village of Ooshika, in the prefecture of Nagano, used to produce large quantities of salt of much better quality than that made from sea-water, and the product was presented to the Emperor. In the reign mentioned the mines were closed, but they are now about to be re-opened by Kudo and some other residents of the village, who have applied to the Home Department for the loan of a sum of money to be expended in the further development of the mines.

One thousand sheep arrived by the *City of Peking*. They were purchased by order of the Agricultural Bureau.

The money deposited in the Post Office saving banks during last January amounted to 48,037.80 yen. The withdrawals were 20,754.32 yen.

The *Nichi Nichi Shimbun* says that "the Dutch merchants in Yokohama have applied to their Consul for permission to establish a rice guild. What steps will be taken about it?"

The *Bakka Shimpō* says that "the use of Japanese articles in America becomes more and more fashionable day by day. Large quantities of old curios, painted paper screens, &c., are imported into that country from here. We also hear that quite a number of men and women are employed in America manufacturing imitation Japanese articles."

The *Genkai Maru* has taken to Kobe gold bullion valued at 129,508.15 yen, belonging to the Finance Department.

Samples of the first and second qualities of white and yellow cocoons, and silk manufactured in the Tomioka Silk Manufactory, in the province of Joshu, are to be sent as exhibits to the Melbourne Exhibition. About a hundred different samples of timber grown in Yesso are also to be forwarded.

## MISCELLANEOUS.

The *Hochi Shimbun* contains a letter from its correspondent at Fusan, Corea, dated the 11th of this month. This communication is as follows:—"Whenever the *Kanko Maru* arrives here from Japan, she always brings a large number of passengers from the different prefectures. House-building is going on rapidly and increasing every day, so that there are now about two hundred and fifty houses and over two thousand Japanese residents. Several restaurants have been established, some of which are conducted in European style; they are all well patronized and very successful. The Coreans frequently visit the restaurants and express great admiration of the food, &c. Commerce, however, which is of more importance, is in a very dull state; and the only business doing is a trifling trade in shirtings and a few other articles from which a very small profit is derived, because it is the custom to sell to the Coreans on long credit. Early this month, an American man-of-war arrived here, but she left after a stay of three days. It is reported that the vessel is shortly expected here again, and also that an English man-of-war is coming over from Nagasaki. While the American vessel remained here, the Torai Fu authorities prohibited the Coreans from visiting the Japanese concession, so that as long as the American stayed in port, not even a single daily labourer came into our settlement."

Cholera has re-appeared in Osaka, and several fatal cases have been reported.

A fire occurred at Sanjo-kami-machi, in the province of Echigo, about 1.30 p.m. on the 21st instant. A strong south-eastern gale was blowing at the time; and about 2,400 houses,

beside the local office, a police station and other official buildings were destroyed. Thirty-six lives were lost, a great number of people were injured, and about seventy persons are missing. The fire was not extinguished until 7 p.m. on the same day.

The *Osaka Shimbun* states that Onui, the wife of Ikawa Seisaku, a resident of Yoshida-machi Takata-gori, in the prefecture of Hiroshima, gave birth to five children on the night of the 14th instant. Three of the infants were males, and two females, but the mother and all the children died during the same night.

The *Mainichi Shimbun* states that "some time last month, a Russian man-of-war arrived on the coast of Kan-kin-dai, Corea, for the purpose of entering into a treaty of friendship and commerce with Corea. The commander of the vessel presented a letter on the subject to the local authorities of that place, and asked them to transmit it to their central government. This they refused to do, stating that they were forbidden to do so by the laws of the country. We hear from another authority that at first the Russian man-of-war anchored on the coast at a place known as Kinjo or Injo, in Kan-kin-dai, where the commander of the ship immediately landed at the head of a body of men. The Coreans seeing the Russians landing, became greatly alarmed, and quickly closed the gates of the town, and assumed an attitude of defence. The Russians who were not in the slightest degree afraid of the movement of the Coreans, broke down the gates of the town, and forced their way in. Upon this the governor of the town was obliged to present himself, and received the Russians at an interview. The invaders upbraided the governor very severely for Corea refusing to conclude a treaty with Russia which is so close to the country, while it has entered into a treaty of peace and commerce with Japan, which is separated from Corea by a large extent of water."

Some of the loyal inhabitants of the district of Kaahiwaya, in the prefecture of Fukuoka, lately applied for permission to present a quantity of timber of large size grown at Wakasugi-yama, for use in the construction of the new Imperial palace. The offering has been accepted.

A wrestling competition is going on daily in the grounds of the Ekoin (Buddhist Temple) at Muko-Riogoku, Tokio. More than three thousand people attend every day and the competition will last a few days more.

Cholera seems to be making its re-appearance in numerous localities, and several cases are reported from Kosuge Mura, in the prefecture of Yamagata. Two fatal cases are said to have occurred at Takamatsu, in the province of Sanuki, and Kaminori Mura, in the province of Echizen.

Small-pox has declared itself in the neighbourhood of the town of Kofu, in the prefecture of Yamanaishi.

Mr. Akagawa, the editor of the *Futsu Shimbun*, having criticised the recently issued regulations for the control of public meetings in his paper, has been fined 15 yen.

## ARRIVAL OF THE AMERICAN MAIL.

## TELEGRAMS.

London, April 28th.—Twenty-six thousand weavers will strike in two weeks in the Blackburn District, unless wages are advanced.

Berlin, April 28th.—The Reichstag to-day, by a vote of 181 to 69, adopted the following resolution: It is unnecessary to reopen the question of taxation on tobacco by proposing the introduction of a tobacco monopoly.

One member of the Government participated in the debate, which was raised upon the abstract resolution, but Prince Hohenlohe Laugeburg, one of their usual supporters, proposed an amendment that it was inopportune for the House to express an opinion on the subject.

The amendment was negatived.

Berlin, April 28th.—The rejection of the vote against the tobacco monopoly has given rise to reports of a speedy dissolution of the Reichstag.

Berlin, April 28th.—The Socialist victory in the election at Hamburg caused great surprise.

Paris, April 28th.—The Radicals of Lyons intend to nominate Blanqui (Communist) for the vacancy in the Chamber of Deputies, caused by Blanqui's being ineligible. The effect of his election would be to further embarrass the present Ministry.

St. Petersburg, April 28th.—No official information has yet been published respecting the capture of Shevitch. The *Agence Russa* says: It may be positively affirmed that the report of his capture is untrue.

Constantinople, April 28th.—Sir Austin Layard received a telegram from Lord Salisbury asking him to specify the points of the Treaty of Berlin, which are still unexecuted, and to forward a statement of the financial position of Turkey, in order that Lord Salisbury may leave a correct account of those matters to his successor. The Marquis of Hartington has written to a friend in Constantinople stating that one of the chief tasks of the new Cabinet, will be to effect an improvement in the affairs in Turkey.

Rome, April 28th.—In the Chamber of Deputies to-day, Signor Bova, of the extreme Left, moved a resolution declaring the Chamber's regret that the Government should have again to present a request for provisional exercise of the budget passes to order of the day. Signor Bova made a speech violently attacking the Cabinet. Premier Cairoli refused to accept the resolution. Crispi accused the Government of wishing to postpone a discussion of the budget.

Lahore, April 28th.—A message has reached Jellalabad from Cabul, stating that a tribal combination has been formed at Khoora Cabul to attack the post there. Communication between Ross and Cabul is cut off.

Cabul, April 28th.—Native messengers report an engagement at Hydabad on the 25th instant between General Ross and the mixed tribes. The enemy was defeated with a loss of 1,200. The British loss is unknown.

London, April 29th.—Parliament was formally and simply opened to-day by Lord Selborne, Lord High Chancellor, the Duke of Argyll, Earl Granville, Earl Sydney and Lord Northbrooke acting as the Royal Commission. There was a fair attendance of Commons, including many new members. Only twenty Tory and fourteen Liberal Peers, two Bishops and fifteen Peeresses were present in the House of Lords.

In the House of Commons there was a meagre attendance.

Some Irish members, including O'Donnell and Fenyon, sat on the Tory side, and others on the Liberal side. The House floor and galleries were very crowded.

London, April 29th.—The *Standard* says: We have reason to believe that the Government does not contemplate the introduction of a bill for the redistribution of Parliamentary seats until the result of the census of 1881 is ascertained. It follows that a new Reform bill could not be laid before Parliament until 1882.

London, April 29th.—Arthur Wellesley Peel has been appointed Under Secretary for the Home Department. Lord Richard Grosvenor will succeed W. P. Adams as Liberal "Whip."

Lord Carlingford has declined the Ambassadorship at Constantinople.

London, April 29th.—The Catholic Archbishop of Dublin, in a pastoral says: Doctrines destructive of mutual

confidence are laid down by some public speakers as the first principles of morals. Patriotism is invoked as the spirit of disunion between priests and people. The evil genius of communism, which has brought such fearful woes in various lands, is only watching the opportunity which that disunion may give it to try and establish its hideous throne among us. Our people have yet many wrongs. Our educational system is imperfect; our land laws, though reformed, can still be employed as instruments of great injustice, and we must use every means which, with God's blessing, can be invoked to redress these wrongs.

London, April 29th.—It is announced that last week a steamer touched off Lundy Island, at the entrance of Bristol Channel, for the purpose of transferring two passengers to a fishing smack. A steamer named the *Helena* has a cargo of fifteen thousand rifles, four million cartridges, and a torpedo launch. These were to be landed in Crete about the end of May, when a revolution is to break out in various parts of the island. The two passengers are Cretan agents entrusted with the purchase of arms. This is the ship some American correspondents say was intended for a raid on Cuba.

Dublin, April 29th.—The Land League Conference in Dublin to-day unanimously passed a resolution favoring the speedy pushing forward of the bill for the suspension of ejectments for nonpayment of rent, for two years and Parnell, O'Donoghue and three members of the Land League were appointed a Committee to draft such bills.

Cork, April 29th.—The transshipment of the *Constellation's* cargo to different British gunboats has been completed. The *Valorous*, with the residue of the cargo, has sailed for Galway. Captain Potter and the officers of the *Constellation* were entertained at a banquet to-night, given by the Mayor and citizens.

London, April 29th.—The Duke of Edinburgh landed at Valencia yesterday. He was waited upon by the relief deputation and escorted to the Anglo-American Cable station, where arrangements had been made to insure direct communication with Princess Louise at Ottawa.

London, April 29th.—The handicap race at Newmarket was won by Sanford's *Aristocrat*—*Flotsam* second, *Fricola* third. Betting just before the race was 2 to 1 against *Aristocrat*, 6 to 4 against *Flotsam*, and 7 to 1 against *Fricola*. *Aristocrat* and *Flotsam* kept close together till half way down the hill, when *Aristocrat* came away and won by four lengths, with *Fricola* a bad third.

Berlin, April 29th.—It is probable that the Reichstag, which has been recently ill attended, will be closed on the 10th of May. Grave doubts are entertained whether the same Deputies will ever again assemble.

Bismarck has declared to some political friends his firm intention to go to the House, when the commercial treaty with Austria is being debated, for the purpose of officially expressing his views on the political situation. Bismarck deeply and sincerely regrets the victory of Liberalism in England.

The rumor that Count Kanoliji is about to vacate his post as Ambassador of Austria at London is unfounded.

Vienna, April 29th.—There appears now to be no doubt that the Turkish officials who were charged with the surrender of the ceded territory to Montenegro did not adhere to the tenor of the convention, and it is rather questionable whether the Porte, with the forces at its disposal at Chauratari, can carry out the convention, so the whole question appears again on the point of being reopened.

Constantinople, April 29th.—The Porte, in a note to Ambassadors, denies all responsibility for the Montenegrin trouble. It declares that the Turkish authorities have strictly conformed to the Convention, and declines to re-occupy positions taken by Albanians. Two thousand men have been sent to Scutari.

Rome, April 29th.—In the Chamber of Deputies to-day, Zanadelli, former Minister of the Interior, introduced as the order of the day a declaration, that the Chamber, being persuaded that the question of the policy of the Government will form an opportune subject for discussion, when the budget of the Minister of the Interior is introduced, passes to the order of the day.

Signor Zanadelli submitted that it was impossible to give a conscientious vote on a question of confidence in the Ministry, unless the vote was preceded by a detailed debate. In order to learn the true policy of the Cabinet,

it was necessary to adjourn in consideration of the question under debate.

Signor Lefres, present Minister of the Interior, declared that the Government could not accept Signer Zanadelli's motion, but that the question of confidence in the Ministry must be settled immediately. A division was had, and the Government was defeated by a vote of 176 to 153, the majority being composed of 83 members of the Right, and various sections of the Left.

The provisional exercise of the Budget for May was then agreed to. In consequence of the previous vote, Premier Cairoli requested the Chamber to suspend its sittings until the Ministry had taken the orders of the King.

The Cabinet Council, after a prolonged sitting, decided that the Ministers should place their resignations in the hands of the King.

London, April 30th.—Yesterday's rise in the price of silver was in consequence of the announcement that the amount of India bills offered Wednesday next will be reduced five lacs, making a reduction of £1,000,000 in the weekly total since the commencement of the India financial year. This caused a decided improvement in the rates of exchange on India and China, and the silver market naturally became very firm, though there was no business done in consequence of the exhaustion of supplies.

London, April 30th.—Sir A. D. Hayter has been appointed Junior Lord of the Treasury, and Lord Kensington Controller of the Household. Earl Cowper has been appointed Lord Lieutenant of Ireland; Lord O'Hagan, Lord Chancellor of Ireland, and Dr. Hugh, Law Attorney-General for Ireland.

Dublin, April 30th.—Parnell's Great National Land Conference yesterday was a signal failure.

St. Petersburg, April 30th.—On the anniversary of the Emperor's birthday, a reception was held at the winter Palace, the Envoys Extraordinary of Germany and Austria, and deputations from the German regiments of which the Czar is an honorary Colonel, attended. Much importance is attached to the presence of Envoys from Vienna, as none ever attended on a similar occasion. The Berlin *Post* connects the circumstance with the possibility of the renewal of an alliance of these Emperors.

Berlin, April 30th.—All the Jews of foreign birth in St. Petersburg have been ordered to quit the city within six hours.

Berlin, April 30th.—In the Reichstag yesterday the Coasting Trade bill was defeated, it being the third measure carried against the Government in three days. Rumours of dissolution increase, but before the Reichstag can be dismissed several important Government measures must be disposed of, including the Socialist and Usury laws, the bill to combat the rinderpest, and the commercial treaties with Austria and Belgium.

Berlin, April 30th.—In consequence of the refusal of the Reichstag to grant a subsidy, the Directors of the German South Sea Trading Co. have resolved to summon a meeting of the shareholders, to appoint liquidators to wind up the affairs of the company.

Vienna, April 30th.—During the fire at Groesbach, Moravia, some malicious persons incited the mob to attack the Jews. One Jew was mortally injured, another had his hand cut off, and others were saved with the utmost difficulty.

London, April 30th.—A Paris dispatch to the *Daily News* says: Wheat has declined considerably, and the position of the American and French corn syndicates is considered precarious.

Paris, April 30th.—The return billiard match between Slosson and Vignaux will not take place, Slosson having left Paris some days ago.

Paris, April 30th.—The Chamber of Deputies yesterday reversed its decision of Thursday reducing the duty on petroleum, because the high duty would be a leverage towards a commercial treaty with the United States.

Lisbon, April 30th.—In the Chamber of Peers to-day the President of the Council denied that there was any understanding with Russia regarding the Macao affair.

London, May 1st.—The *Pall Mall Gazette* prints the following prominently: "Frederick Greenwood, who has had the editorial direction of the *Pall Mall Gazette* from the first publication till now, will not be responsible for

political opinions that may appear in its pages after to-day." It is reported that the *Gazette* has a new proprietor.

London, May 1st.—John William Oakden, nineteen years of age, the champion 500-yards shot of England, challenges any man in the world to shoot forty shots, distance 500 yards, at a target four feet in diameter, with eight-inch bulls-eyes, or he will give eight points out of eighty shots, for £250 a side and a 100-guinea challenge cup. He will give or take £50 for expenses to any part of the world.

London, May 1st.—The trustees of the Bolivian bondholders have sold at 109 3-16 a sufficient amount of the United States four-per-cents to distribute the £45 per bond, ordered by the Court, but the distribution is hindered by various legal proceedings, begun by the Collins contractors under Colonel Church, they claiming payments for work out of the fund, and praying for an injunction against its distribution.

A request has been made by this Government that the Danish Government cause inquiries to be made for any traces of the training ship *Atalanta* on the Greenland Coast. Farrar Hirscholl has been appointed Solicitor-General.

London, May 1st.—The *Times*, in approving the appointment of Earl Cowper as Lord-Lieutenant of Ireland, says: "The worst in Ireland seems to be over. Spring has been seasonable, and the promise of the Summer excellent. If a good harvest succeeds the dismal experience of recent years, the exasperation of temper that comes from want will die away. The new Irish Administration has great difficulties to overcome, but if their counsels are equal to their opportunity, they may do much to remove the permanent causes of Irish dissatisfaction."

Dublin, May 1st.—The *Freeman's Journal* says: The details of Parnell's land scheme could never be carried out save by revolution. No Parliament likely to be elected for a generation would consent to compel all landlords to sell. The wildness of Parnell's scheme has obliged the original sponsors for land questions to protest against it.

Paris, May 1st.—The Salon opens to-day and will be illuminated on evenings by an electric light. Four thousand pictures are on exhibition.

Paris, May 1st.—A committee, headed by Duc de Rochefoucauld, Legitimist, of members of the Chamber of Deputies, has been formed to raise a fund for the defence of religious liberty. The Committee consists of nineteen members, twenty being treated by law as constituting illegal associations. Though most of the members are Legitimists, there are three or four hitherto regarded as Bonapartists, who must now be considered as repudiating Prince Jerome Napoleon, for the object of the Committee is to resist the decrees which Prince Jerome distinctly approved.

St. Petersburg, May 1st.—Seventy houses have been burned at Radomysl, in the government of Tchernigoff, and 180 at Nemeroff, in Podolia. Upwards of 200 families have been left homeless.

An emphatic denial is given to the story that foreign Jews are being expelled from Russia.

Valparaiso, April 6th.—The Chilean squadron bombarded Callao without effect. Two divisions have been sent from Arequipa against Moquebequa. Colonel Albarracin has captured 300 Chilean cavalry at Locambe.

President Campero, of Bolivia, had arrived at Tacna.

London, May 3rd.—Lord Charles Brudenell Bruce, re-elected to Parliament for Marlborough, has been appointed Vice-Chamberlain.

London, May 3rd.—W. S. Cartwright, a large colliery proprietor and owner of race horses, is dead.

Berlin, May 3rd.—The *North German Gazette* denies the rumors recently circulated by Progressist newspapers of Bismarck's approaching retirement from office, and says that the Chancellor, in consequence of the abstention from Parliamentary attendance imposed upon him by the state of his health, has enjoyed an opportunity for devoting his attention more continually to Ministerial duties in foreign and home affairs, and has himself stated that he daily acquires greater love for those duties, and that his former inclination to seize every opportunity to remain at his country seat proportionately diminishes their right and duty to do. Cazot was warmly applauded, and Republican members who had intended to speak stated that in view of the declaration of the Minister they would refrain from debate. Lamy then proposed an order of the day, demand-

ing that the law relating to the right of association be immediately laid on the table. The Government moved the order of the day, pure and simple, which was adopted, 362 to 137.

John Lemoine, yielding to the urgent request of the Directors of the *Journal des Debats*, has withdrawn his acceptance of the post of Minister at Brussels.

Berlin, May 3rd.—The Hamburg Senate has transmitted to the Bundesrath an energetic protest against the incorporation of St. Paul's in the Zollverein.

Dublin, May 3rd.—Captain Potter and the officers of the *Constellation* have arrived in Dublin. They attended the Gaiety Theatre to-night. An arch of flags, in which the Stars and Stripes predominated, was thrown across the street in front of the Mansion House.

Berlin, May 3rd.—The President of the Reichstag had a conference with Bismarck, at which it was settled that the House could adjourn on the 11th of May.

London, May 2nd.—A Constantinople despatch says the *Levant Herald* has been suspended for hinting that the Government had better begin reforming before the English Cabinet recognizes the necessity of executing the "Bag and Baggage" policy.

Constantinople, May 3rd.—The assassin of Colonel Commeroff has been finally declared sane, and will probably be hanged in a few days.

Berlin, May 3rd.—The Reichstag to-day approved the extradition treaty concluded between Germany and Hungary. The bill approving the provisional commercial arrangement between Germany and Austria passed its first and second reading. The measure was recommended by a Plenipotentiary of the Bundesrath and the Director of the Foreign Office, Herr Von Philipsborn, who said the Government hoped that within the course of a year they would succeed in extending to commercial matters the understanding between Germany and Austria which existed in political relations. Herr Hoffman, President of the Imperial Chancery, pointed out that the bill afforded a basis for any future understanding. A treaty would be of the highest value, even if it contained nothing beyond the "most favored nation" clause. The present arrangement, though only provisional, contained everything it was possible to obtain in the present state of affairs.

Cabul, May 2nd.—The whole of General Ross' force has arrived. General Stewart now takes charge, General Roberts retaining divisional command.

Two natives have gone on a mission to Abdurrahman Khan.

The leading priests and Logar Chiefs have submitted. A hundred Kehistan Chiefs have been sent home after guaranteeing safety to the Sirdars whom the British intend to send there.

The Government is inclined to favor Abdurrahman Khan as Ameer, but great caution is necessary. A mission will be sent to meet him at Kurudz.

Calcutta, May 2nd.—Owing to the aspect of affairs in Afghanistan a reserve division of Bombay troops is about to be mobilized and sent toward the Candahar line.

London, May 2nd.—The usual banquet, given by the Council of the Royal Academy, took place Saturday night. The Prince of Wales, replying to a toast to the royal family, alluded to the work of the Duke of Edinburgh in Ireland. He said his brother had an opportunity of taking supplies from the *Constellation*, that gallant ship, sent over by our American cousins, who are so noble and generous. Gladstone replied to a toast to Her Majesty's Ministers. The President of the Academy, Sir Frederick Leighton, proposing a toast to "Science and Literature," took occasion to welcome Bret Harte, who responded in a humorous speech which was much cheered.

London, May 2nd.—Editor Greenwood writes to the *Standard*, giving his reasons for quitting the *Pall Mall Gazette*. He says: "We do not propose to allow our independent paper to be extinguished. Its spirit resides in us, and will soon reappear in a new shape. Hoping to redeem the paper from the threatened assignment, we formally offered a large sum for the copyright, which was refused." The proprietor of the *Pall Mall Gazette* writes to the *Standard*, emphatically denying that his paper will be henceforth conducted as a Ministerial journal.

Berlin, May 2nd.—Owing to Bismarck's nervous system being much overstrained, the physicians of his family urge

his temporary retirement from State affairs, and it is expected he will take a long leave of absence.

London, May 2nd.—The laying of the Channel cable, connecting with the new French cable at Brest, is completed, and telegraphic communication is now open between Penzance and Brest.

Rome, May 2nd.—The King has signed a decree dissolving the Chamber of Deputies. Elections will be held on May 16th, and the New Chamber will meet on May 28th.

London, May 2nd.—At a Cabinet Council, summoned to-day, Lord Wolverton was appointed Paymaster-General, and Osborn Morgan, Judge Advocate-General.

Paris, May, 2nd.—The saw mills at Aubervilliers have been destroyed by fire. The immense stores of timber were burned.

Bombay, May 2nd.—General Stewart has sent a large field force through Logan Valley to open communication with Cabul.

New York, May 4th.—A cable dispatch to the *Herald* from Paris says:—Onr St. Petersburg correspondent telegraphs as follows: The revocation of the appointment of Count Tolstoy as a member of Public Instruction removes one great obstacle in the way of the success of the reform plans of General Loris Melikoff, and is a source of very great satisfaction in all quarters.

Princess Kontoholuy, the lady president of the Red Cross Society, has received an order decreeing her to be prepared with a large supply of lint bandages, which are probably intended either for the troops on the expedition to the Chinese frontier, or for General Skobloff's command.

A banquet has been given by the Czar at the Winter Palace to officers of the Horse Grenadiers of the Guard and of the Battalion of Finland, being the troops to which the soldiers who were killed in the recent explosion at the Palace belonged. Covers were laid for 200 guests. It is a significant fact that the only diplomat present was the German ambassador, Baron de Werder; his military attaché was also among the guests.

The Empress has within the last few days had several attacks of delirium. The condition of Prince Gortchakoff has not improved. He is losing his memory, and repeats to himself incessantly all his daily communications to the Emperor.

Calcutta, May 3rd.—The Maharajah of Alwar has written to the Government offering to be at the entire cost of maintaining a native regiment of Afghanistan volunteers, and his own personal service.

The appointment of the Marquis of Ripon as Viceroy of India is, on the whole, received favorably. Much disappointment is expressed that Lord Dufferin's health prevented his appointment.

Dublin, May 3rd.—Captain Potter and officers of the *Constellation* arrived in Dublin to-day. They attended the Gaiety Theatre to-night. An arch of flags, in which the stars and stripes predominated, was thrown across the street in front of the Mansion House.

Cabul, May 3rd.—The military force is now again so strong that any operations can be undertaken. The country has been without settled government for eighteen months, and the rural population is in a very disorderly state. The population of Cabul, comprising the partisans of the different hordes, is always ready for excitement. The rebellion is now practically ended. Very few rebels remain in arms, and the villagers are helping to hunt them out.

Constantinople, May 3rd.—English officers in the Turkish gendarmerie have been informed that their contracts will be renewed if they will consent to 45 per cent reduction in salary.

Rome, May 3rd.—The King declines to accept the resignation of the Ministry, but has accepted their proposition to dissolve the Chamber of Deputies.

Boston, May 3rd.—The *Bulletin* says: A large importing house here, who have agents in China, have not received any confirmatory advices regarding the reported troubles with Russia, and the price of tea is not affected in the least. The markets here show no signs of uneasiness, and prices have rather a tendency to further decline. It is suggested in some quarters that the rumors have been set afloat in the London market in order to give a stimulus to the trade.

London, May 4th.—A Paris dispatch says: A stand fell at the Leric races near Agen. It is reported that 100 persons were injured.

Paris, May 3rd.—In the Chamber of Deputies to-day Lauey, Republican and Catholic, introduced an interpellation contesting the validity of the ancient statutes cited by the government in support of the decrees against unauthorized religious congregations. Minister to Justice Cazot argued that the laws were perfectly valid and had not in any sense fallen into disuse, but had always been enforced when the government of the day considered it necessary, although various governments had from time to time allowed them to remain in abeyance, either through negligence or culpable connivance, he held the republic was perfectly justified in defending itself and the government would, therefore, put into operation the existing laws, as it was their right and duty to do. Cazot was warmly applauded, and the Republican members who had intended to speak stated that, in view of the declarations of the Minister of Justice, they would refrain from debate. Lauey then proposed an order of the day demanding that the law relating to the right of association be immediately laid on the table. The Government moved the order of the day, pure and simple, which was adopted by a vote of 362 to 137.

New York, May 4th.—A cable from London of the 3rd says: In the House of Commons to-day the question of Charles Bradlaugh's right to his seat came up for discussion. In a well-considered and temperate speech Bradlaugh claimed that he should be admitted upon making an affirmation instead of taking oath. He quoted in support of his claim the fact that by virtue of the provisions of the evidence amendment Act of 1879, he and all other atheists were permitted to give evidence in a Court of justice, although they did not call on God to witness their truthfulness, nor say that they believed God. The Speaker, Mr. Brand, said he had grave doubts as to the effects of the Acts referred to, and did not think it applied at all to the oath required of members of Parliament. He therefore wished the House to decide the question. Lord Cavendish referred to the precedent in the case of Baron Rothschild, who was elected before the passage of the law permitting the House to dispense at its pleasure with the provisions requiring a member to swear by the true faith of a Christian, and moved for the appointment of a select committee to consider the case. Sir Stafford Northcote seconded the motion and the House voted to appoint a committee.

The Queen had a council at Windsor this morning, at which all the members of the new Cabinet were present.

Lord Charles Brudenell Bruce (moderate Liberal), re-elected to Parliament for Marlborough, has been appointed Vice-Chamberlain.

London, May 3rd.—Parnell, having been elected to sit for Cork, A. M. Sullivan has consented to stand for Meath county.

Washington, May 3rd.—A telegram was received to-day at the legation of Chili from Panama, which says the Chilean navy bombarded Callao on the 22d of April, causing heavy damages on the shore and nearly destroying the Peruvian corvette *Union*. Lima is threatened by the Chileans, and great distress prevails.

London, April 28th.—The following additional Cabinet appointments have been made: Chamberlain President of the Board of Trade, and John George Dodson, President of the Local Government Board.

The following appointments, outside of the Cabinet, are also announced: Henry Fawcett, Postmaster-General; Anthony J. Mundella, Vice-President of the Council; Grant Duff, Under Secretary for the Colonial Department; Lord F. Cavendish, Secretary to the Treasury; Dr. Lyon Playfair, Chairman of the Committee of Ways and Means; Sir H. James, Attorney-General; J. McClaren, Lord Associate of Scotland; Mr. Balfour, Solicitor General for Scotland; Earl of Cork and Orrery, Master of the Buckhounds, instead of Master of Horse, as reported yesterday; Duke of Westminster, Master of Horse; Marquis of Landsdown, Under Secretary for India; Earl of Morley, Under Secretary of War; Thomas Brassey, Civil Lord of the Admiralty; Campbell Bannerman, Financial Secretary of the War office; Lord Carlingford, Ambassador at Constantinople.

The Cabinet, with fourteen members, is now complete.

No appointment will be made for the present to the office of Lord Lieutenant of Ireland.

Goschen declined the Ambassadorship at Constantinople.

London, April 28th.—Although no distinctive policy has yet been adopted by the Home Rulers, it is certain that a great effort will be made by Parnellites to prevent the party from attaching itself to the Liberals.

The Parnellites have passed a resolution pledging an active section to the Independent Opposition. The Parnellites will take their place in the House on the Opposition benches. In the absence of Parnell, O'Donnell acts as Chief.

Shaw's supporters have refused to participate in Parnell's land conference to-day, owing to the extreme resolutions to be submitted on land tenure in Ireland.

London, April 28th.—The *Times*, in a financial article, says: A statement to the effect that the leading German statesmen are highly favorable to bi-metalism is published in the *Paris Bourse*. If this is well-founded, the German Government appears at length to have realized what was predicted from the first, that in her existing commercial position Germany is incapable of maintaining a single gold standard. The *Paris Bourse* says: The leading men of Germany have been won over to the cause of bi-metalism not through conviction but necessity and advocates of a new plan for international agreement on a common basis include Von Kordorff, Von Merlosch and Schoilemerolst. We (the *Times*) have no sympathy with their dream of a uniform ratio between gold and silver, which is about as realizable as a uniform ratio between cheese and corn; but the fact of an agitation having arisen in any shape for the rehabilitation of silver in Germany is too significant to be overlooked.

#### THE JAPANESE PRESS.

#### RE-APPEARANCE OF THE "MAINICHI SHIMBUN."

(Translated from that paper.)

ON the 11th of May, the 13th year of Meiji (1890), the Governor of Kanagawa Ken addressed the following notice to our office:—"Notice is hereby given, that the *Tokio-Yokohama Mainichi Shimbun* published in your office, is suspended from further publication." When we received this order, the employes of our office, who number more than a hundred men, looked into each other's faces in a most distressed condition, and some of them said:—"Nothing can be more unfortunate in the life of a man than the suspension of his calling." If our paper should be suspended for a month, some of our employes would lose the means of supporting their fathers and mothers, wives and children, and if our paper was suspended for so long a time as two or three months, then some of our employes would die from starvation! Should we then supplicate the Government to release us from the doom of suspension? As regards the suspension of Japanese newspapers by order, the authorities do not give any definite explanation respecting the offence committed, and as there was accordingly no explanation given of the offence committed by us, we had no means afforded of apologising for our fault. Shall we then give up our present occupation, and seek other employment, so as to get a fresh means of livelihood? The order of suspension being different from that of suppression—in the latter event we would obtain another employment at once—but in the case of suspension only, it is impossible to say if a paper will not be released at any moment, and if our paper was released after all our men changed their employment, it would not then be the Government that stopped the publication of the *Mainichi Shimbun*, but the journal itself that ceased of its own accord. After a few days, we went to our financial office, and examined the books to see the increase or decrease of the number of our subscribers. We then found that after our paper was suspended, our subscribers had increased on an average by more than ten persons every day, and some people on receipt of the news of our suspension wanted to buy our paper, while others, not being aware of the news, wished to subscribe to our paper from the date of the arrival of their instructions in our office. We were very sorry for the former who wanted our paper when they heard of our misfortune, but more especially were we sorry for the latter who were not aware of it. We accordingly at once despatched replies to our new subscribers in the following words:—"Through

inadvertence we committed an offence, and received an order for the suspension of our paper. We are unable to say as yet when the suspension will be removed, and therefore we are very sorry that we cannot comply with your order at present. However, if you will be so kind as to desire to see our journal, please wait until our paper shall be released from suspension." We have written more than a hundred such letters in reply to the new orders from subscribers.

We have been placed in a very peculiar position. On the one hand we wished to ascertain the private will of the Government about our suspension, but could not obtain even the slightest hint on the subject, the gulf between the Government and the people being as wide as the distance between the sky and the earth. On the other hand, when we wished to take up our pen, we found our head filled with political opinions, and thus discovered ourselves incapable of preventing our hand from committing an editorial offence. When we counted on our fingers the time which had elapsed since the suspension, we found that it lasted for ten days, and that we had no publication of ten numbers of our paper. During those days we were very weary of spending our time in idleness, and did not know what to do; indeed this is a special kind of seige which is laid on a newspaper office. What a happy day is the 20th of May, in the 13th year of Meiji (1880), the day on which the Governor of Kanagawa Ken issued the following notice to our office:—"Notice is hereby given that the *Tokio-Yokohama Mainichi Shinbun*, published in your office, that has been suspended since the 11th instant, will be allowed to reappear from to-morrow, the 21st instant." On receipt of this order, our employes were all highly delighted; some seized their pens, others commenced to set type, while a third party turned the machine; thus everybody began to attend to his work, as if the sun was rising in the east. All our people commenced to work with zeal, and as it was after 6 o'clock in the evening when we received the notice of our release from suspension, our employes all worked by lamp-light, and forgetting both their hunger and want of sleep, finished the publication of the new issue of our paper, by cock-crow at daybreak. Thus we availed ourselves of the first opportunity of apologising to our subscribers for our non-publication of this journal for several days. In consequence of this hurry there will probably be twice as many mistakes in our present issue than ordinarily, and we therefore wish our readers to excuse us on this occasion.

It was on the 11th instant that our paper was suspended, and when our Government suspends the publication of a newspaper, it gives no definite explanation respecting the offence committed by the journalist, nor as to which of the sentences or reports were in violation of the laws. Thus we have no means of repenting for our past offence, nor can we guard ourselves from similar conduct in future. Now we stand at present in the position of a man searching for a path in darkness, and if we wish to direct our course to the east, we cannot see if we may not be in danger of falling into a creek, and if we wish to step westward, we are unable to see if our progress may not be obstructed by the sea. However, on looking into some of the past numbers of our journal issued just before we received the order of suspension, we find that on the 10th instant we dealt with the decision of the Senate respecting the local taxes in Tokio Fu, but we believe that article gave no offence. On the 11th instant we wrote about "Mr. Secretary Inouye's mission to China," but we only cannot see that this article was a breach of the law, or liable to endanger the peace of the country. As the Loochoo question affects the honour of our country, we thought it our duty to comment upon the advantages and disadvantages of the reported objects of Mr. Inouye's mission. However, judging the course of our late suspension from our experience in the past, we suspect we received the formidable order of suspension in consequence of our editorial note on the 11th instant, respecting "Mr. Secretary Inouye's mission to China." It is said that the *Choya Shinbun* was suspended in May of the 11th year of Meiji (1878), on account of the assassination of the late Okubo, Minister for the Interior, and we hear that the suspension of the *Choya Shinbun* and the *Akebono Shinbun*, in the month of February this year, was on account of their comments upon the incident which occurred to His Royal Highness Prince Heinrich of Prussia, when out shooting. It is now thought that the recent

suspension of our paper originated from our remarks upon "Mr. Secretary Inouye's mission to China," which article was published by us on the morning of our suspension. We believed that the Loochoo question affects, to no small extent, the honour or disgrace, the advantage and disadvantage of Japan for all future time. Therefore, just as Mr. Gladstone animadverted upon the Afghanistan war, it is the plain duty of our countrymen, we believe, to discuss the Loochoo question in all its bearings and phases. However, we are not in a position to say that as our Government are very cautious they may not have deemed our comments prejudicial to their diplomatic designs. Therefore, although it is much against our will not to continue our article on the Loochoo question, yet, as the suspension of a paper is a very heavy and formidable burden for which the mere following up of an article cannot atone, we shall not continue the subject of "Mr. Secretary Inouye's mission to China," and are going to pass on to other subjects. We trust that our readers will not blame us for the course we now pursue, and they may rest assured that when we get an opportunity some other time of discussing the now prohibited question, we shall not fail to do so. We have written this article in order to supply a part of the history of the *Mainichi Shinbun*.

#### LAW REPORTS.

##### NAVAL COURT HELD AT H. B. M.'s CONSULATE AT KANAGAWA.

Before MARTIN DOHMEN, Esq., H. B. M.'s Acting Consul, President; Lieut. the Hon. FRANCIS SPRING RICE, of H. B. M.'s ship *Modeste*; and FREDERICK DUNBAR WALKER, Esq., Master British ship *Madame Demorest*.  
Monday, the 24th of May, 1880.

Mr. F. Lowder appeared on behalf of the complainants. Captain Hatfield, the accused, suggested that the Court should consist of five members instead of three.

Counsel for the prosecution pointed out that the matter was in the discretion of the Court itself, and read the paragraph bearing on the subject.

Mr. Dohmen said that if the captain had mentioned the matter previously, the Court would have been summoned according to his wishes, but to make a change now would involve an adjournment of two days, and as the matter was by law left to the discretion of the Court, no change would be made.

Counsel for the prosecution said the case had only just been put in his hands, and therefore he would not make a long address, but would simply read the charge.

The Court called for the captain's certificates, but Mr. Lowder, as *amicus curie*, pointed out that according to the latest enactment on the subject, the Court could not call for the certificate until it was suspended or cancelled.

Mr. Lowder then read the following charge:—

We, the undersigned, seamen of the *Clydesdale*, do charge Jacob Kelly Hatfield, master of the said vessel, with various acts of drunkenness and otherwise wilfully endangering the safety of the ship, its crew and cargo, while in charge of the same.

We charge the said Jacob Kelly Hatfield:

1st.—That he committed an act of drunkenness on the 27th of September last, the day the ship left New York:

2nd.—That he committed another act of drunkenness about the early part of December:

3rd.—That he committed a third act of drunkenness on the 23rd of March last, on which occasion, the ship being about one mile from the land, the said Jacob Kelly Hatfield came into the fore-castle and, while sitting there, said "he had pointed the vessel once before and would do so again," leading us to infer that he meditated the wilful destruction of the vessel; upon this and at our request the mate took charge of the ship.

Signed: HENRIE MYERS.

L. JANSSON.

ALFRED BURMAN.

ANTONIO MENDES.

RICHARD HART, his (x) mark.

JOHN WILLIAMS, his (x) mark.

T. SCHMIDT.

NIEL MCLENKXAN.

CHARLES CARLYSON.

EDWARD CULLEN.

Solemnly declared before me.

(Signed.) MARTIN DOHMEN,  
Acting-Consul.

May 19th, 1880.

In answer to the Court, the captain said his certificate was an English one.

Mr. Lowder called :—

Henrie Meyers, who being sworn, said :—I am an able seaman on board the *Clydesdale*. She left there on the 27th of September, 1879. I have nothing to say except as to the charge of drunkenness. On the first day out from New York, as the pilot was leaving us, the master was drunk. He was drunk, and I do not think he was capable of taking charge of the ship. I saw him at the time. He remained that way about twelve hours. I cannot say if he came on board drunk, as we went out about three a.m. It was blowing a four knot breeze. The master was drunk and not able to take charge of the ship and sail her. The mate took charge. The next occasion when he was drunk was when we were somewhere near the Cape of Good Hope. I saw him drunk. He was so drunk as to be unable to take charge of the ship. It was very rough weather, the ship was under main and fore lower foretopsails. We were pumping heavily all the time. I do not know how much she was leaking. We had to work the pumps every two hours by the watch. The mate took charge of the ship. The drunkenness of the captain lasted two days. He was so drunk as to be unable to take charge of the ship. The third occasion was as we neared the coast of Japan. I believe it was on the 19th of April. I am not sure whether it was March or April. The ship was in a bad position. She was about a mile and a half from the shore when the wind struck her from the north-west. We expected to be lost that night. The reason why we expected that was because there was no command, and the ship was in danger. She was on a lee shore. The master was too drunk to take charge on that occasion. He was drunk about a day and night. I did not hear the master say anything in the fore-castle that day.

Cross-examined by the captain : The day before I came on shore I went into your cabin. I did not beg your pardon and say I had to follow the crowd. We were all called aft. I asked you three or four times for my discharge. I was with John Williams when he came to you on the street and asked for a discharge and offered to give up his wages. I acquiesced and would have agreed to take my discharge on those terms. If I had got my discharge then or at any other time, I would not have brought this charge. I should have had nothing more to do with the ship and should not have done so. On the 27th of September, when the ship left New York, she had all sail on her. You laid down and went to sleep.

By the Court : The ship left New York at 8 a.m. and the pilot left at 7 a.m. When he left the captain took charge for a couple of hours and then he went and laid down and nobody could find him. The first mate had charge of the deck from 8 a.m. to noon, and the second mate, during the afternoon. On the second occasion we had only the main lower topsail set all night. We were hove-to. I and another man went to loosen the fore lower topsail, and it blew away. The captain came out of his cabin occasionally and rolled about. He was too drunk to stand. When we made the coast of Japan we were about a mile and a half from land. It was close to Kobe I think. The wind shifted at about 11 p.m. At first it was calm with rain. Then the wind shifted again and blew hard. There was no light in sight. We were trying to make Yokohama. When first I asked for my discharge it was before this Court was ordered. When we left Sandy Hook the wind was from the south. It was fair and all sail was set except the royals. Most of the sail was on the ship when the pilot left. The captain did not fall down. Any one could see the captain was drunk. I never had a word with the captain. When the ship arrived here I asked for my discharge, but the captain said he wanted me.

Cross-examined by the captain : I was mistaken when I said the ship was hove-to. We were running with a fair wind. We were under the main and fore topsails and not under the reefed foresail.

To Mr. Lowder :—On the occasion when Williams asked

for his discharge and said he would forfeit his wages, I would not have forfeited mine. My reason for wanting my discharge was I had no more respect for the ship I was on board. This I swear to.

Charles Welden, sworn said :—I am an ordinary seaman on board the *Clydesdale*, I sailed in her from New York. On the 27th of September I saw the captain drunk, but from the state of the weather I did not consider he committed any act of drunkenness except in ordering the tug to let go the hawser when some distance from the vessel, so that it got under the vessel. His appearance and speech made me think he was drunk, but in the state of the weather he was competent to take charge of the vessel, though he would not have been if a gale had sprung up. I cannot say how long he continued drunk. He was drunk on deck two or three hours, and then went below, and I don't know when he came up again. We were off the Cape in the early part of December. It was blowing a gale of wind. I don't remember when it came on. On the occasion I refer to the captain put on mizzen upper topsails and main top-gallant sail, thus pressing the ship in the gale. She was leaking heavily, and pressing on so much sail made her ship heavy seas. When we were off the Cape he was drinking right along, in my opinion. Sometimes he became intoxicated, and sometimes not. The third occasion was on the 18th, 19th, and 20th of March. It was between 8 and 12 on the 18th, say about 11 p.m. when we sighted the coast of Japan. The weather was fair, but there were signs of bad weather. He was running in to land to find Yokohama. I suppose he wanted to find the land, and then coast along until he got into the bay. After sighting the coast it was a little after daylight on the following morning when it came on to blow heavily, almost dead on shore; it lasted all that day and the following night, and commenced to lull away the following morning, I think. When we sighted the land the captain was on the poop sitting in his chair. I went below at 12 p.m., at the end of my watch. The captain had stopped on deck till then. When we sighted the land, at 11 p.m., he had no appearance of liquor on him, nor at 12 p.m. I came on deck at 4 a.m. I saw the captain; he was on deck, or came up soon after. He appeared to have considerable liquor on board. His face was flushed, and his walk showed it as well as his speech. All hands were kept on deck all that day on account of the ship's danger. I think that from 10 a.m. that morning, till about daylight on the following morning, he was incapable of handling the ship. During that time I consider that the ship was in danger. If the wind had not shifted between 10 and 11 that night, she would have gone on shore. I think the captain should have tacked off shore instead of running in shore, as he did. I did not hear any one advise him to tack off, but I heard murmurings among the crew. The captain appeared to keep charge of the ship, giving his orders to the mate, who obeyed him. During the worst of the gale the captain was below, and the steward said he was asleep. I heard the captain mutter on the poop on the night of the 19th : "Yes; she will go on shore, and I don't care."

Cross-examined by the captain :—I do not know whether you refused to pay the tug captain's bill because he let go the hawser. I do not know that you were a tectotalter during part of the voyage. I can swear you were under the influence of liquor during that time, to the best of my knowledge and belief. I cannot say positively what time the ship's head was wore round. The gale commenced between 8 and 12 a.m., if my memory is correct; I thought it commenced in the morning. I remember giving you some money after leaving port. I have been going to sea between two and three years. I consider you carried too much sail on several occasions.

The Court adjourned until 1 o'clock.

On resuming, Mr. Lowder called

John Williams, who, being sworn, said :—I am an able seaman on board the *Clydesdale*. I shipped in New York, and made the voyage in that vessel here. I am one of the men who signed the complaint. It is true. I saw the captain drunk on the 27th of September, the day we left New York. I knew he was drunk by his actions and the way he was carrying on. When the ship was off the Cape I was at the wheel. The captain was reeling drunk. He had fallen, and was rolling on the deck and caught told of the binnacle. It was blowing a gale of wind at the time.

I only saw him drunk once. He gave orders to set the lower fore-topsail, but before it was sheeted home it blew away. I know of the third occasion. It was between the 19th and 23rd of March. He ran the ship right on a lee shore, between two headlands. He was drunk then. He was able to walk about. I remember his coming into the fore-castle, and when within a yard of me he said "he had pointed her once, but she would not go, but he would point her again. We were all old sailors, and would all go to h— together." On that occasion we appealed to the chief officer. I saw the chief officer, and said to him:—"For God's sake let us get the ship round and off the land, as we are endangering the ship and all hands." He said:—"You know what sort of a man we've got to deal with since we left New York," and that he didn't like to take charge. But he did take charge of her and brought the ship round. Three or four times I asked the captain for my discharge, but he refused. I said I had not much money coming to me; but I would give him half if he would give me my discharge. He told me he thought the English Consul would not give me my discharge. I am afraid to go in the ship, as he has threatened to put her on shore. I have no objections to the ship if the captain was not in her. I cannot tell how much wages are due me.

Cross-examined by the captain:—I said to you that I had done wrong. I meant by that overstaying my leave. I have seen men fall on deck in a storm from a sea, but your fall with Meyers was different to that. You were drunk, and took him down with you. I have seen sails blown away when they were being set. I do not know that you took those headlands for an entrance to the Kii Channel. I remember the 24th of March, when you called us all aft and asked if we could suggest anything to be done. [The captain proposed to go to the Bonin Islands.] We said:—"Captain, you can do what ever you think best."

Niel MacLennan, sworn, said:—I am an able seaman on board the *Clydesdale*, and signed the complaint. I remember the 27th of September. The captain was drunk when we left New York. I saw him drunk off the Cape. I saw him drunk several times, but not as bad as he was on the three occasions mentioned in the charge. The third occasion was close to the land off Kii. He was too drunk to take charge of the ship. He came to the fore-castle and said he had pointed her once, and he would do it again. I was at the wheel when the appeal was made to the mate to take charge of the ship. I was at the wheel from noon to 2 p.m. When the captain came to the fore-castle and made that remark it was sometime during the afternoon.

Cross-examined by the captain:—As near as I can remember, the words were as I have said them.

By the Court:—We took the words "point her" to mean point her in towards the land. When the captain made use of the expression "point her," I thought he meant to run her on shore, and that he was drunk and did not know what he was doing. That was the only time he ran her too close. I was at the wheel when the appeal was made to the mate to take charge.

Teodor Schmidt, sworn, said:—I have heard the evidence already given before the Court. I can speak to having myself seen the captain drunk on the three occasions mentioned. I have nothing to add to the evidence. On the last occasion I was laid up with the scurvy, and can only speak as to what the captain said in the fore-castle. I thought he meant to put the ship on shore. He seemed drunk at the time. I have not asked for my discharge. I could go in the ship so long as the captain is not in her.

Cross-examined by the captain:—I know nothing of my being about to go boatswain of the ship. I worked more than two months on the voyage. I was not a sick man when I came on board the ship.

L. Jansson, sworn said:—I signed the charge. I remember the three occasions on which the captain was drunk. I saw him drunk on all those occasions. I was sick in the fore-castle with scurvy, and heard Hart say to the mate, that he had better take charge of the ship, as we were in danger of our lives.

Cross-examined by the captain:—I fell off the house and laid up then. I never had the yellow fever. I worked when I was able. I laid up with scurvy, and four weeks from a fall, and worked six months. We are eight months out from New York.

By the Court:—I said I heard Hart request the mate to

take charge of the ship. It was in the fore-castle. The mate took charge, saying he must take charge or else he would lose his certificate. It was in the afternoon the captain said, in the fore-castle:—"I pointed her once, and she wouldn't go, and I'll do it again." It was about a couple of hours after, that Hart asked the mate to take charge during the afternoon before the captain came in the fore-castle. I was too sick to notice what the captain did during the two hours he was in the fore-castle, but I am sure he was there.

Richard Hart, sworn, said:—I am an able seaman on board the *Clydesdale*. I have heard the evidence which has been given. I saw the captain drunk on the three occasions mentioned. I have not seen him so drunk on other occasions, but I cannot say how many times he has been half seas over and kicking up a noise. He has not been sober all the time. I remember appealing to the mate to take charge of the ship. I kept no dates. It was, as near as I can tell, about 3 o'clock in the afternoon. I was very bad with the scurvy. I can see out over the bulwarks from the fore-castle door, and I could see the rocks quite plain. They did not appear to be more than two miles off. Shortly afterwards the chief mate came into the fore-castle and looked at the barometer. He said he had only once before since he had been going to sea seen as low a glass. The captain had not been into the fore-castle at that time. I knew the captain was drunk when I was speaking to the mate.

Cross-examined by the captain:—I think I have worked since I have been in the ship about five months, and been two months badly. I was well when I went on board the ship. I did not lay up till after passing the Cape, when I got a wetting, and after that I sometimes laid up. I remember arriving at the Bonin Islands and going on shore and being nursed for eight or ten days.

By the Court:—I was sick at the time I asked the mate to take charge of the ship. I did not do so at the request of the rest of the ship's company. I could not say if the mate took charge of the ship before the captain came into the fore-castle. I do not know if the mate then had charge. When the captain came into the fore-castle he went into the port side and I do not know what he did there.

William Drew, sworn, said:—I served on board the *Clydesdale* as cook from New York to Yokohama. I have been discharged since I arrived in Yokohama at my own request, and with the consent of the captain. I have heard the evidence referring to the three occasions. The captain was under the influence of liquor. I could not call him drunk.

Cross-examined by the captain:—With the exception of these three cases I don't remember seeing you under the influence of liquor. I do not know who called me here as a witness to-day.

Alfred Burman, sworn, said:—I am an ordinary seaman on board the *Clydesdale*. I have heard the evidence given. I saw the captain on those three occasions. I think he was drunk. I joined in this complaint.

Antonio Mendez, sworn, said:—I am an ordinary seaman on board the *Clydesdale*. I have heard the evidence given before the Court. I remember the three occasions spoken of. The captain was drunk and not only a little the worse for liquor. He was incapable of taking charge of the ship.

Edward Cullen, sworn, said:—I have heard the evidence already given. I saw the captain drunk on those occasions. He was drunk. I call a man drunk when he is pretty full and does not know what he is doing.

Charles Carlyson, sworn, said:—I am an able seaman on board the *Clydesdale*. I have heard the evidence. I remember seeing the captain drunk on all three of the occasions mentioned. I mean by drunk that he did not know what he was doing.

Robert Trapp, sworn, said:—I am a boy on board the *Clydesdale*. I have heard the evidence given. I do not think the captain was drunk on all three occasions, only on one, the third. On the other occasions I should think he had been drinking a little, but I would not call him drunk.

By the Court:—I am living in the after part of the ship. The crew have no cause for malicious complaint. I do not know of there being any conspiracy against the master.

Auguste Visberg, sworn, said:—I am an able seaman on board the *Clydesdale*. I have heard the evidence that has

been given in Court. I think the captain was decidedly drunk on the three occasions mentioned.

This closed the evidence in support of the charge.

The captain called James Scott, who, being sworn, said:—I am chief officer of the *Clydesdale*. I have never taken charge of the ship, nor have I ever been requested to do so. It is customary for a captain to give his orders to his officers at night, and then go below and go to sleep. I have heard the evidence, and did nothing in regard to wearing, tacking, &c., except what I have been ordered to do by the captain. I have found some of these men who have testified at times mutinous and disorderly. Can't swear but that you may have had a drink or two, but that was leaving port, and I have never seen you so that you couldn't command or give me orders. I have seen signs of liquor on you once or twice during the voyage of seven months, but nothing to prevent your looking after the vessel. I know you were a teetotaler from leaving New York to the 27th of November, and then again through the Indian Ocean to the middle of March. At least I never saw you drink anything.

Cross-examined by Mr. Lowder:—I mean by being a teetotaler that he abstained from drink. The only occasion I saw signs of liquor on the captain was when we came out of New York. He might have had a glass of liquor when off the Cape, but I didn't notice it. On this last occasion I could not say he was the worse for liquor. During the time we were standing in, I did not consider we were in danger. We were standing in to try to get a pilot.

By the Court:—There are no entries in the log book against any of the complainants. When the pilot left the ship at New York I consider the captain was capable of taking charge of the ship. We sighted the coast on the 19th of March, and reached in; the wind being about south-south-east. I was in charge of the deck, and the captain told me to stand in and try and pick up a pilot or fisherman to assist us. Saw a schooner which hoisted a Japanese flag. The wind was moderate. The barometer fell, and by midnight the wind came round to the northward and blew a fresh gale. It did not blow hard till it veered to the northward.

Thomas Brown, sworn, said:—I am the second mate of the *Clydesdale*. I have heard the statements made against you. I have been with you five years as boat-swain, &c., and have never known you to be incapable or drunk yet.

By the Court:—I know of no cause why the men should conspire. I expect that they could not get their discharge, although they wished it. I keep a regular watch. On the second and third occasions spoken of we were working by the captain's orders. When we left New York the captain was not drunk. He took charge of the work.

Thomas McGregor, sworn, said:—I am the carpenter of the *Clydesdale*. I have been with you three years. I have never found you drunk. You were always capable of doing your duty on board the ship. I have been thirty-four years going to sea and never saw a better or more competent ship-master. The reason for these complaints is a conspiracy amongst the men. They want to leave the ship here. It has been going on ever since they left New York. I do not know of this conspiracy, I only guess at it. I have heard their conversation several times.

William Coburn, sworn, said:—I am an ordinary seaman on board the *Clydesdale*. I have been with you about a year and a half. I have seen you under the influence of liquor, but not incapable of doing your duty. I have had no threats from those men to prevent me giving evidence. In my opinion the statement that you tipples at sea is not true.

Cross-examined by Mr. Lowder:—I am among the crew a good deal. I do not know of any conspiracy against the captain. I believe this charge has been made because the men could not get their discharge. Such is my opinion, but I did not hear any say so.

By the Court:—I live amidsthips.

John Sifeit, sworn said:—I was recently third mate of the *Clydesdale*. I have never seen you drunk. I have seen you with a little liquor in you, but never incapable of doing your duty. The statement of Welden and others that you were in the habit of getting tight at sea is not true. I don't know how this charge has originated. I know the

men wanted their discharge before they arrived here. I have heard them say, when a month out from New York, they would have their discharges by fair means or foul. Hart, Schmidt and Jansson, the leading men in this charge, have been the most useless men on board.

Cross-examined by Mr. Lowder:—They growled because they had to stand at the pumps every two hours and in bad weather every hour. They also said that the old man was tight. Some ships make more water than others. I did not consider the pumping out of the way. She probably leaked. That class of vessel usually does leak when five or six years old. I did not hear any of these men here say they would have their discharge by fair means or foul. Robert Allen and Owen Carrot, who have been discharged here, said so.

Peter Anderson, sworn, said:—I am an able seaman on board the *Clydesdale*. These men said that they wanted me to sign that paper, but I wanted to stop on board the ship and refused to do so. The men asked me this morning what boat I was going on shore in. I told them the captain's boat, and they then said I had better look out for myself.

This closed the evidence in denial.

The captain addressing the Court said it was evident that the seamen had brought this charge to get clear of the ship as is not unusual in crews shipped in New York. He had discharged part of them and kept the rest. He had to keep some to do the work. It would be plain to the Court that these men had tried to get even with him for refusing to discharge them, and he was bound to take these men along with him under any circumstances.

Mr. Lowder said that with regard to the charge of repeated drunkenness, about fourteen men have testified to the facts. The defence had rested mainly on a charge of conspiracy. This charge is a very grave one and should not have been hastily brought without proper grounds to base it on. There did not appear to be any foundation for the accusation, as far as the evidence before the Court went. All the witnesses guess about the fact of the presence of the conspiracy, and say there was general growling on board, which was not surprising considering the amount of pumping which had to be done. There was no evidence that any but two out of the whole fourteen men ever asked for their discharge, and they even say they have no reason to object to the ship, but only to the drunkenness of the captain. Counsel then went through the evidence of the various witnesses for the defence and showed that it did not rebut that for the prosecution, but on the other hand, showed there was a good deal of foundation for the charge. Counsel considered that the evidence had fallen short of proving the 3rd paragraph of the charge which under Section 239 of the Act of 1854, would be a misdemeanour and punishable with a fine of £100 and imprisonment for six months. This, he was happy to say, was not proven, but he must say that he believed the other charges of drunkenness were fully proved, and under Section 24 of the Act of 1862, were punishable as a gross misdemeanour.

The Court then adjourned till 10 a.m. on Tuesday, May 25th.

—  
Tuesday, the 25th of May, 1880.

The Court re-assembled at 10.30 a.m., when the following decision was read:—

The Court finds that the evidence adduced at the investigation is insufficient to prove the charges brought by ten of the crew against the master, Jacob Kelly Hatfield; but the Court cannot absolve the said master entirely from blame, as it has been clearly established that he has at times been more or less under the influence of liquor during the voyage from New York to Yokohama, and for this he is severely reprimanded and ordered to pay the costs of the Court, under section 263 of the Merchant Shipping Act.

(Signed)

MARTIN DONNEN,

H. B. M. Acting-Consul, President.

FRANCIS SPRING RICE,  
Lieut. R.N.

F. D. WALKER,  
Master Mariner.

## IN THE IMPERIAL GERMAN CONSULAR COURT.

Before E. ZATTE, Esq., Consul.

F. GRUNWALD and F. RETZ, Assessors.

Tuesday, the 25th May, 1880.

WM. BERLOWITZ vs. CHAS. SEITZ.

This was a charge of assault and battery, and making use of foul language.

The Court tried to pacify the plaintiff, and get him to withdraw his suit; but failing in its efforts, the case was brought to trial.

The complaint stated that on the 9th of May, 1880, whilst on the road between Yokohama and Totsuka, and also in Totsuka, defendant met plaintiff, and struck him several blows with a whip,—at the same time calling him a great scoundrel, liar, and ruffian, in a manner contrary to law, and injurious to plaintiff's feelings and his honour.

This was an offence against par. 185 of the penal code.

Plaintiff and defendant both appeared in person.

The witnesses were excluded from the Court.

Defendant made the following statement:—My name is Chas. Seitz. I am 37 years of age. I am a stevedore. I have lived in Yokohama some time, but have never been punished before.

The complaint having been read, defendant was asked if he had anything to say against the charge. He said: On the day mentioned, I called the plaintiff a scoundrel, a liar, and another bad name. I also beat him, as stated in the charge, several times with the whip. But plaintiff had provoked this by having called the house of Mrs. Weldrum not respectable, and a brothel, though he visits there. The proofs of this are the statements of Captains Larsen, Hanck, and Roedor. Captain Larsen has informed me of this statement made by plaintiff. These captains have all left Yokohama. I beat plaintiff because I live with Mrs. Weldrum, and have a child by her, and consider her my wife. I did not attack plaintiff without warning him to retract what he said against Mrs. Weldrum. As he refused to retract and denied that he ever used the words, I struck him. I have a witness now in Court who was present and heard Captain Larsen tell me what plaintiff had said.

The witness were called in singly before the Court.

Henrich Amandos August Elsen, sworn, said:—I am 42 years of age, and a book-keeper. I live in Yokohama. On the 9th of May I was with Messrs. Freitag and Berlowitz in the gardens of the tea-house at Totsuka, to which place we had made an excursion. We were there about half an hour when Mr. Munsch and defendant came back from a visit to Daibutz and stopped at the tea-house. Freitag, Berlowitz and myself left the gardens to visit the caves. When we left the tea-house defendant met us and stopped before us. He jumped out of the carriage and sprang on Berlowitz. He took the latter's arm and asked him if he would retract what he had said. Berlowitz replied that he did not know what he had said, and thereupon defendant beat him. I tried to quiet the parties, and when we got back to the tea-house there was more excited talk, and defendant again beat plaintiff and also threatened to beat me. I forgot to mention that I also heard defendant call plaintiff the greatest ruffian and scoundrel in Yokohama. Defendant was not drunk.

Edward Freitag and Robert Walstab gave substantially the same evidence as the previous witness.

The decision of the Court was that defendant was guilty of assault and battery and sentenced to pay a fine of 800 marks (\$200). In default of payment imprisonment for six weeks. Defendant to pay the costs of the proceedings.

## IN H. B. M.'S COURT FOR JAPAN.

Before R. T. RENNIE, Esq., Judge.

Tuesday, the 25th day of May, 1880.

SAMUEL COCKING vs. D. MORGAN, master British steamer *Flintshire*.

The petition set forth that this was a claim for the recovery of the sum of \$95.90, money payable by defendant to plaintiff for the value of two kegs of merchandise, marked 291 in diamond, N. under, received by defendant

to be carried from London to Yokohama in the steamship *Flintshire*, whereof defendant was master for the said voyage, and there to be delivered to the said plaintiff according to the terms and conditions of the bill of lading in that behalf granted, and which said kegs of merchandise had not been delivered by the defendant to the plaintiff, but had been wholly lost to plaintiff.

Mr. Litchfield appeared for the plaintiff, and Mr. D'Iffanger represented Messrs. Adamson, Bell & Co., the ship's Agents, who appeared for defendant.

Mr. Litchfield said the goods were shipped in good order, but when plaintiff went to take delivery, only a lot of staves and some chemicals, which corresponded to those in the packages shipped, were tendered him. For the plaintiff he was prepared to prove that the goods were packed in good and sufficient oak stave kegs with iron hoops. The contents were chloride of tin, which was not a dangerous substance, and was not calculated to damage itself, or its packing, or any goods in its neighborhood. Some chlorides are dangerous, but chloride of tin is not.

Counsel called

Samuel Cocking, sworn, said:—I am a merchant carrying on business in Yokohama. I have done a good deal of business in drugs and chemicals. I expected a lot of goods by the *Flintshire*. This (exhibit A.) is the bill of lading for them. They are marked on the bill of lading 291 N, on margin. The goods are my own, purchased on my account, and shipped to me. I think the *Flintshire* arrived here a month ago. No kegs with the mark as on the bill of lading were delivered to me. When I found that there were none I sent in a claim to the agents for short delivery. After I did that there was a bundle of matting with a few staves and some damaged chemicals wrapped up in it tendered to me. I did not accept delivery of these. I got two merchants to hold a regular survey on the lot of stuff there was there. They took samples of the staves. The goods I was expecting according to the invoice were chloride of tin. I have frequently imported it previously, but not in large quantities. I usually get it in wooden casks of from 1 cwt. to 5 cwt. each. Most of it has arrived in very good order. I have never had to make a claim before. The market price in Yokohama for chloride of tin about two months ago (the last lot I sold) was 35 cents per lb. These kegs contained 1 cwt. each. I do not know who is the master of the *Flintshire* on this voyage. This (exhibit B) is a note of the claim I sent in to the agents of the vessel.

Cross-examined by Mr. D'Iffanger:—I cannot speak as a chemist as to the liability of chloride of tin to get damaged by exposure to dampness.

By the Court:—I saw the shipping clerk of defendant's agents, and he told me they refused to recognise the claim, as they had had a survey (by Dr. Geerts, I think), and he had advised them not to pay it.

Herman Grauert, sworn, said:—I am a merchant in Yokohama, at 75A. I held a survey last month at Mr. Cocking's request, at the Hatoba. The goods were said to have been landed ex *Flintshire*. I could see no marks. There was a heap of chemicals wrapped up in Chinese matting. There were some staves and some wooden hoops. The staves were of oak wood. According to my judgment, I should say a cask made from such staves would be very good for chemicals. It is difficult to say, but I should think the cause of the damage was bad handling on board the ship. I have had experience as an importer of drugs. I have been established here nine years, and have imported drugs all the time. I have had no chloride of tin lately, and do not know what its value is. Have never imported chloride of tin. Went within two yards of the chemicals, and noticed no bad smell. The staves I saw were similar to this (exhibit C).

Cross-examined by Mr. D'Iffanger:—(shown exhibit D) That might also be a stave of the cask; it has a strong smell.

By the Court:—I have never imported chloride of tin. I suppose it would be in one cwt. packages, such as similar articles come in. They generally arrive in good order, and I suppose this would. By they, I mean chloride of potash.

C. H. Cobden sworn, said:—I am a British subject. I am shipping clerk to Jardine, Matheson & Co. I have had considerable experience in landing goods. I was called by Mr. Cocking in April last to hold a survey. I was shown

a lot of staves and mats with chemicals. There were Mr. Grauert, Mr. Cocking, and myself. Mr. Wex was also present. I saw the staves; they were mostly in good order, the same as exhibit C. I saw none so bad as exhibit D. I have had considerable experience with chlorides, particularly chloride of lime. In this lot I surveyed I did not notice any strong smell. If I had gone as near a heap of chloride of lime as I went to this I should have been able to detect a smell. I know nothing of chloride of tin. I have never seen it before. I have seen chloride of lime come out from England in similar packages in perfect order. The casks were all smashed up.

This closed the case for the plaintiff.

Mr. D'Ifanger said that the grounds upon which the defence rested were, that the goods had not been damaged in the ship through bad handling, but that the condition they were in was owing to their being of a nature to destroy both themselves, and other goods with which they came in contact, this he should prove by the evidence of a professional chemist, and also that they came under the clauses of the Bill of Lading which exempt the ship from claims for decay, and which say that such goods may, if necessary, be thrown overboard.

D. Scott, sworn, said:—I reside at No. 9, Bluff. I am a British subject and marine surveyor. I surveyed the stowage of the *Flintshire* both before and after discharging. I saw the two casks in question on board the ship two or three days before they were discharged. They had been properly stowed.

Cross-examined by Mr. Litchfield:—I saw the casks on the second day the ship had been unloading. Some of the Chinese cargo had been removed. It was probably from Hongkong. The Singapore cargo was all over the ship. The staves of one of the casks were broken. I cannot say when that damage was done.

By the Court:—The casks were stowed in tiers. They looked to me to be light ones. When I saw them there was no pressure on them.

James Martin, Jun., sworn, said:—I am a British subject. I live at 239, Bluff. I am a storekeeper. Early in April last I was employed on board the *Flintshire*. I remember seeing the casks in question. When I first saw them in breaking out the cargo, the head of one was out and some of the staves broken. I have been a shipmaster, and I consider they were properly stowed. In the state they were I consider it would have been difficult to have landed them without their falling to pieces.

Cross-examined by Mr. Litchfield:—One of them certainly could not have been landed without collapsing. It appeared to be a very seedy package, and poor for that kind of goods. The cooperage was bad, and the whole thing was slight.

By the Court:—The head had fallen in by bad cooperage.

Mr. Litchfield admitted that exhibit D (put in by defendant) was one of the staves which had been picked up on board the *Flintshire* by Dr. Geerts, and was the one referred to in the document written by him.

Mr. D'Ifanger said that he had been greatly disappointed at not being able to secure the attendance of Dr. Geerts, the witness on whose testimony he most relied, but who absolutely refused to appear before the Court. He had, through the English Consul, applied to the Dutch authorities to have him subpoenaed, but the Dutch Consul said that he had no power to do so. Neither would the doctor testify before his own Consul in presence of plaintiff's counsel nor submit to a cross-examination. All he could do therefore would be to submit the survey report made by Dr. Geerts, duly authenticated by the signature of the Dutch Consul.

His Honour thought that the Court could take the document for what it was worth, and did not think the rule excluding such evidence inflexible.

At the request of plaintiff's counsel the case was adjourned till 10.30 a.m. on Thursday, to allow counsel to argue the admissibility of the document in question.

Thursday, the 27th day of May, 1880.

On the Court resuming, His Honour observed that the certificate tendered in evidence on behalf of the defendant was not in the form of an affidavit, but the signature of Dr. Geerts was merely verified by the Dutch Consul.

Mr. Litchfield stated that he had until now been under the impression that an affidavit had been made by Dr. Geerts, before his Consul. If the document had been an affidavit there might have been some excuse, under the circumstances, for attempting to put it in evidence.

His Honour:—The question with me is whether I am not entitled to take the certificate in evidence for what it is worth. For instance in the same way as an extract read from a work on chemistry?

Mr. Litchfield:—But not more than extracts from a book.

His Honour:—Am I entitled to take into consideration the statement in this document as to the effect of packing chloride of tin in a particular way. I will read the certificate, (certificate read stating that chloride of tin, packed as that claimed for, would be liable to destroy the casks.)

Mr. Litchfield:—If the certificate is to be received I might just as well put in the British Pharmacopœia, which would probably be considered a better authority than even Dr. Geerts.

His Honour:—It is very common to read extracts from medical works.

Mr. Litchfield:—In cross-examination, but the facts have to be proved first in the same way as the laws of foreign countries. These cannot be proved by the mere production of a book, except as to those countries where the laws have been codified, but, under 15 and 16 Vic., must be proved by experts. In the same way chemical facts must be proved. Certainly they must be proved in some more regular way than the mere production of a report of which the other side knows nothing. The plaintiff had no notice that Dr. Geerts was going to make a survey. This brings us within rule that pre-appointed evidence must be watched closely. If a certificate of this kind is admitted in evidence, the door is opened widely for all sorts of irregularities.

His Honour:—If the defendant had been represented by counsel, he could have put the certificate into the hands of one of the plaintiff's witnesses upon cross-examination, and have asked him if he did not agree with it.

Mr. Litchfield:—The fact must have first been established that the witness understood chemistry, and if he recognized Dr. Geerts as an authority on the subject. The usual procedure is to ascertain the work written by the witness's favourite professor and then ask him how far he agrees or disagrees with it. But extracts from a book cannot be taken in opposition to sworn evidence.

His Honour:—The defendant has done his utmost to procure the attendance of Dr. Geerts.

Mr. Litchfield:—I am quite aware of that, your Honour.

His Honour:—Therefore cannot he be said to have laid the necessary foundation for an application for the admission of this certificate for what it may be worth. I cannot find any absolute rule prohibiting the admission of a document of the kind for what it may be worth.

Mr. Litchfield:—Neither can I, your Honour, but there is the primary rule that evidence must be given *virâ voce*. This is also mentioned in the Judicature Acts, which, however, go further. Order 37, Rule 1, of the Rules and Orders made under those Acts, provides that in the absence of agreement evidence must be given *virâ voce* and in open Court. The Court may, however, allow affidavits, &c., to be received in evidence upon such terms as the Court may deem expedient. When witnesses cannot be obtained, they are examined by means of interrogatories, &c. If the other party *bonâ fide* desires the production of a witness for cross-examination and such witness can be produced, no order shall be made authorising the evidence of such witness to be given on affidavit.

His Honour:—The note to that Order carries the effect of it much further.

Mr. Litchfield:—Taylor in the last edition of his work on evidence, page 453, edit. 7, says:—"That no examination or deposition to be taken by virtue of these acts respectively, shall be read in evidence at any trial without the consent of the party against whom the same may be offered, unless it shall appear to the satisfaction of the judge, that the examinant or defendant is beyond the jurisdiction of the court, or dead, unable from permanent sickness or other personal infirmity to attend," &c. It was not, of course, pretended that Dr. Geerts came within any of those exceptions. We should like to know also if Dr. Geerts has given this certificate in the capacity of a merchant or a chemist. The

defendant's case is, apparently, that the chloride was not properly packed.

His Honour:—That point is not mentioned in the certificate, which is merely headed:—"Report upon two casks of chloride of tin, &c." Surely there must be some cases in which chemists have made reports and then left the country?

Mr. Litchfield:—I cannot find any, and do not recollect such a case in my experience. I do not think this is to be wondered at, because the question could only arise in a place like this. In England, evidence of the kind would be taken by a commission, probably by consent. If unsatisfactory evidence of this description is admitted it will place me in the position of being able to procure certificates from Greeks, Belgians, &c., and thus putting in a multiplicity of evidence. The principle I contend for is, that a commission should issue.

His Honour:—I have no power to issue a commission as regards foreigners.

Mr. Litchfield:—Dr. Geerts might, I think, be induced to appear before a commission, because in that case fees would be payable to him. I can recollect that he did not appear to show any reluctance to give evidence in the case of *Malcolm v. Smith*.

His Honour:—It appears a very strange thing to me that the Dutch Consul has no power in the matter. I must consider this question further, as the point involved is a difficult one. Can you say, Mr. D'Iffanger, that Dr. Geerts surveyed these casks?

Mr. D'Iffanger:—No, your Honour, but I can produce Mr. Wex, who saw him survey them.

His Honour:—I have by no means made up my mind to take the report, but before I consider it further, it should be in evidence, as a matter of form, that an individual named Geerts did examine the casks, so as to connect the person giving the certificate with the person who inspected the casks.

Mr. Litchfield:—I am prepared to admit that, your Honour.

Mr. D'Iffanger:—Is it too late for me to call more evidence, your Honour, to show that chloride of tin is dangerous cargo?

His Honour:—The defendant's case was not closed. The Court adjourned when the question arose respecting the certificate and I shall therefore receive further testimony. The amount claimed is small, but the principle involved is serious. When could you produce your further evidence?

Mr. D'Iffanger:—In a very short time, this afternoon.

His Honour:—I should like to have some further evidence, and I shall therefore adjourn the case, and permit both parties to call fresh evidence.

Mr. Litchfield:—We shall require some samples of the chloride of tin.

Mr. D'Iffanger:—The staves are in the possession of the Court, and there is enough sticking on them to spoil your clothes.

His Honour:—Well, I'll adjourn the case until 11 o'clock to-morrow.

#### NAVAL INQUIRY.

Before J. J. EUSLIE, Esq.,

Friday, the 28th day of May, 1880.

Inquiry held at H. B. M.'s Consulate, at Kanagawa, Japan, regarding the death of A. G. Fogelstrom, late carpenter of the British barque *Pym*, of Sunderland; official number, 68,910.

Mr. Euslie read the following entries in the official log respecting the accident:—

"Sunday, October 5th, 1879, 6 p.m., lat. 41 deg. 16 mins. S., long. 44 deg. 49 mins. E. Weather appeared threatening and barometer falling; thought it prudent to shorten sail as the ship was going into a heavy head sea. After clewing up the main-top-gallant sail, and hauling the jib down, heard 'a man overboard.' Ordered the helm to be put down, and found it was the carpenter, A. G. Fogelstrom. He had got a rope with a turn around his left arm, holding on. Three or four men were over the side, and nearly got hold of the collar of his coat, when he slipped his hold. He then caught hold of two more ropes, but they both slipped out of his hands. The ship's way being stopped, he drifted on to the port quarter, when a life-buoy was thrown about a fathom or a fathom and a half from him, when he commenced to swim towards the life-buoy. H. J. S. Clifford, second

officer, jumped overboard with the second life-buoy, and commenced to swim towards him. By this time the boat was got out, and the ship falling around; threw a rope to H. Clifford, and hauled him aboard again, when he jumped into the boat as she was leaving the ship. As soon as the man was overboard, W. Ryan was sent aloft to keep a lookout for the carpenter. H. C. F. Uriel, chief officer, being on the top-gallant fore-castle, saw the man take the life-buoy. F. Frank, A.B., also saw him take the buoy. Paul Laud, A.B., states that whilst in the boat he saw the carpenter had the life-buoy, and told the second mate. James Harvey, A.B., also states the same. When they pulled as hard as they could to the life-buoy, found the buoy, but no man. Seeing a flock of birds a short distance away, made towards them, but could see nothing of the man. Picked up the two life-buoys, and laid in the boat until I called them aboard.

[Signed by the Master, first and second officers, and four seamen.]

"Christian Luther, A.B., states:—I was on the flying-jib-boom with the boy, J. R. Bainbridge, and saw the carpenter fall. He had a foot on the foot-rope and a hand on the life-line. I do not think anything struck him, and I cannot give any cause for his falling. I told the boy to light the flying-jib sheet over when I saw him falling. I told the boy to never mind the sail, but hurry in-board and try and save the man's life.

"The boy, J. R. Bainbridge, states:—I saw the carpenter with one foot on the foot-rope, and he had hold of a rope with one hand. I saw him slip his foot and fall, and as he fell he tried to catch hold of the flying-jib sheet."

[Signed by the Master, Luther, Howgate, and Bainbridge.]

Lionel John Harris Stapleton, master of the barque *Pym*, said:—I have heard the log read, and confirm the same. I have nothing further to say. I believe that there was nothing more that could be done than was done. I do not know what the given names of A. G. Fogelstrom are.

Harry Christ Frederick Uriel, chief officer, said:—I have heard the entry in the log read, and it is correct. There was a boat got out. The second mate went in her. I hove the life-buoy over. I became acquainted with the fact from hearing a man sing out from the jib-boom, "man overboard." I saw him alongside having hold of a rope that was thrown to him. One end of it was fast to the ship. I saw him let go of it. He could not hold it any longer. We tried to pull him up by it. It was before the boat was in the water. After the boat got out the second mate went in her. He was about half a ship's length astern. We were under sail at the time, and in the act of clewing up some of the sails. As soon as we heard the cry of "man overboard" we brought the ship to by the captain's orders. She was not going fast through the water. She drifted to leeward. There was a rather high sea. The waves were so high we could not see him all the time from the deck. There was a man aloft to look out for him. The boat stayed away twenty minutes.

Henry James Simpson Clifford, second mate, said:—I have heard the entry in the log read. It is correct. Jumped into the water just after the two ropes were slipped by the man. I saw him catch hold of them. He was hauled up the ship's side, and I was just going to catch him by the coat collar when he slipped the rope. After he slipped the first rope another was hove to him, and I jumped overboard with the life-buoy and swam towards him, but did not reach him. As I jumped over I saw him where he was, and swam in that direction, but the waves were so high I could not see him after I was in the water. It was the second buoy I had. The first one was thrown to him. There was a rope thrown to me from the ship, and I got on board, and then went in the boat, together with two hands. I got the direction to steer in from the mate on the fore-castle head. I did not see him after I got in the boat. We picked up the other life-buoy and there was no signs of a man. There was a flock of birds at a short distance, and the captain told us to go to them to see if there was a man there. We did not find him there, and rowed about a little while, and as it was coming on dark and the wind was increasing we were ordered on board.

James Harvey, A.B., said:—I have heard the log read, and the statements of the mates. They are all correct. I

have nothing to add to them. We did all we could to save our shipmate. We could do no more.

Farland Frank A.B., said:—The entry in the log is correct. I was ordered up to the main-top-gallant yard when the man fell overboard. The last time I saw him was when he took hold of the life-buoy. I didn't see him after the boat was in the water, owing probably to the sea being high. Everything was done which could be done to save him.

Christian Luther, A.B., said:—I was on the jib-boom with Fogelstrom when he fell overboard. I do not know how he fell. I did not notice him until he was half way down to the water. He was hauling the jib sheet over. I was busy with the sail. I have heard the entry in the log read, and the other evidence. I have nothing to add. I think everything was done that could be done to save the man.

L. J. H. Stapleton, recalled:—I usually employ the carpenter to stow sails when shortening sail. He went out to stow the jib. He was in the habit of assisting in furling sail throughout the voyage. He was carpenter and seaman.

#### FINDING.

I find that A. G. Fogelstrom, late carpenter of the British barque *Pym*, of Sunderland, official number 68,910, fell overboard while at sea in lat. 41.16 S., and long. 44.49 E., and came to his death by drowning. I also find that all available means were used to save the life of the said A. G. Fogelstrom.

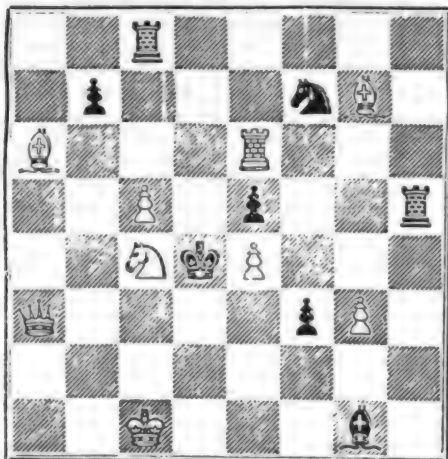

(Signed) J. J. ENSLIE.

#### METEOROLOGICAL REPORT

FOR WEEK BEGINNING FRIDAY, MAY 21ST, 1880.

Observatory of Daigaku, Moto-Fujicho, Hongō, Tokio, Japan.

#### REMARKS.

Heavy line represents barometer.

Light continuous line—max. & min. thermometers.

..... represents velocity of wind

..... percentage of humidity

Max. velocity of wind 16.5 miles per hour on Saturday, at 8 a.m.

The barometer is reduced to the freezing point and to the level of the sea.

The highest reading of the barometer for the week was 30.104 inches on Thursday at 10 p.m. and the lowest was 29.710 inches on Saturday, at 2 p.m. The barometer has been throughout most of the week low, but rising. A maximum temperature of 82° was reached on Wednesday, the 26th instant, the range for that day being also unusually great. The amount was 24°·5, which is considerably higher than the maximum range during May of last year. It is a peculiar coincidence that the maximum temperature for May of last year was reached on the 26th being 84°·5. The total rainfall for the week was 0.910 inches.

#### SHIPPING INTELLIGENCE.

##### INWARDS.

May 22, British barque *Pym*, Stapleton, 748, from Antwerp, General, to Simon, Evers & Co.  
 May 22, U. S. S. sloop *Alert*, Com. C. H. Huntington, 1,020, 4-guns, from Surveying cruise.  
 May 23, British barque *Lord of the Isles*, J. Watt, 317, from Takao, Sugar, to Chinese.  
 May 23, British 3-masted schooner *Ching Tin*, Beckie, 304, from Takao, Sugar, to Chinese.  
 May 23, Japanese steamer *Shinagawa Maru*, Walker, 908, from Kobe, General, to M. B. Co.  
 May 24, Japanese steamer *Sumida Maru*, Hubenet, 896, from Hongkong via Kobe, Mails and General, to M. B. Co.  
 May 24, American steamer *City of Peking*, Berry, 5,079, from San Francisco, Mails and General, to P. M. Co.  
 May 26, British steamer *Malacca*, Seaton, 1,046, from Hongkong via Nagasaki, Mails and General, to P. & O. Co.  
 May 27, Japanese steamer *Hiroshima Maru*, Haswell, 1,200, from Shanghai and way ports, Mails and General, to M. B. Co.  
 May 27, Japanese steamer *Iliogo Maru*, Moore, 896, from Hakodate Mails and General, to M. B. Co.

May 27. British steamer *Merionethshire*, Richards, 1,204, from London via Hongkong, to Adamson, Bell & Co.  
 May 28. Japanese steamer *Kumamoto Maru*, Drummond, 1,240, from Samusawa, Mails and General, to M. B. Co.  
 May 28. Japanese steamer *Togoshima Maru*, Hubbard, 946, from Kobe, Mails and General, to M. B. Co.  
 May 28. German barque *Androklos*, Voyt, 400, from Takao, Sugar, to Kwong Man Tai.

## PASSENGERS.

Per Japanese steamer *Suwida Maru* from Hongkong via Kobe:—Messrs. A. da Selveira, H. Sakata, J. Watanabe, Y. Murakami, S. Akaba, K. Kobayashi, T. Niino, G. Haraba, D. Reynolds, Dr. Schendel, Gov. Watanabe, Messrs. Fujikawa, Taneda, Grita and Ogawa in cabin; 4 Chinese and 96 Japanese in steerage.

Per American steamer *City of Peking* from San Francisco:—Messrs. T. W. Buchanan, W. S. Campbell, Bourier, Samaro Takaki, Rev. T. S. Carter and wife, Miss Jennie S. Vail, Messrs. J. M. Donald, Mrs. R. Burnett, The Hon. T. G. Grosvenor and wife, Miss J. Roberts, Mr. and Mrs. W. Resor, Jr., Mrs. Hawthorn, Mr. and Mrs. C. Schmitz and 2 children, Mr. E. Amaden and Rev. and Mrs. J. Hartale in cabin; 5 Europeans in steerage. For Hongkong: Messrs. J. L. Anderson, C. E. Hay, F. T. Nash and 222 Chinese.

Per Japanese steamer *Hiroshima Maru* from Shanghai & ports:—Col. and Mrs. Dickinson and child, Mr. and Mrs. Illies and two children, Dr. and Mrs. Strachan, Mr. and Mrs. Macey, Mrs. Brower, Mrs. Hubbard, Mrs. Dickson, Mr. and Mrs. Mine, Mrs. Shinagawa, Governor Chida, Dr. Price, U.S.N., Rev. T. Alexander, Messrs. W. Bramsen, H. Browne, E. C. Kirby, W. Grigor, J. D. Carroll, J. Mahon, Potter, J. Colomb, Hogg, Fukuhara, Ashihara, Yoneschi, Furusawa, Kobayashi, Tada, Shinowara, Ikumoto, Shibusawa, Gama, Doi, Ohiki, Akamatsu, Matsumoto, Shiota and Hirano in cabin; 6 Europeans, 3 Chinese and 209 Japanese in steerage.

Per British steamer *Malacca* from Hongkong:—Messrs. G. Graham, J. Multer and Wong Sing Wam, in cabin; and 9 Chinese in steerage.

## OUTWARDS.

May 22. Japanese steamer *Togoshima Maru*, Hubbard, 597, for Kobe, Mails and General, despatched by M. B. Co.  
 May 23. British steamer *Oreonic*, Metcalf, 2,440, for San Francisco, Mails and General, despatched by O. & O. Co.  
 May 26. American steamer *City of Peking*, Berry, 5,079, for Hongkong, Mails and General, despatched by P. M. S. S. Co.  
 May 26. Japanese steamer *Genkai Maru*, Couner, 1,917, for Shanghai and ports, Mails and General, despatched by M. B. Co.  
 May 26. Japanese steamer *Kinkin Maru*, Davidson, 690, for North, Mails and General, despatched by M. B. Co.  
 May 26. Japanese steamer *Sakura Maru*, Kilgour, 524, for Kobe, Mails and General, despatched by M. B. Co.  
 May 26. American schooner *Stella*, Werner, 50, Otter Hunting.  
 May 28. French steamer *Volga*, Guiraud, 1,502, for Hongkong, Mails and General, despatched by M. M. Co.  
 May 28. British barque *Flecher*, Corlyon, 732, for Kobe, General, despatched by Malcolm & Co.  
 May 29. Japanese steamer *Suwida Maru*, Hubenet, 896, for Hongkong via Kobe, Mails and General, despatched by M. B. Co.

## PASSENGERS.

Per British steamer *Oreonic* for San Francisco:—Messrs. James Silkeap, E. Liddell, R. H. Sandeman, E. C. Ray, R. Gamman, Dr. and Mrs. McCarty, Mrs. Mentz, Miss King, Mrs. Pen Hallow, Rev. and Mrs. M. Lambuth, Captain H. Geary, R.A., Captain Thomsett, R.N., Dr. and Mrs. Martin, Mr. S. L. Jones, Miss Jones and maid, Mr. Charles Drake, Mr. and Mrs. Banow, Mr. and Mrs. Thomas, Rev. D. C. Green and five children, Mr. and Mrs. Alex. Center, child and maid, Mr. J. C. St. Clair, Miss N. A. Fielding, Mrs. D. S. Waterlow, Hon. J. C. St. Clair, Miss N. A. Fielding, Mrs. Hughes, H. J. Brown, and R. Ewing. For Liverpool: Messrs. W. H. Poate, J. Peltzer, Mrs. Wheeler and 2 children, Col. E. J. L. Froyman, Mrs. G. de Erdmann and 2 children, Miss Bachlendoof, Messrs. J. A. Frazer, Edward Whittall and Henry W. Masters. For London: Mr. Rankine Wilson. For Paris: Mr. and Mrs. H. E. Aoki and maid, Messrs. Kido, Akabane, Duke de Blacas, Baron de Pibroc and Lavigny in cabin; five European in steerage.

Per Japanese steamer *Genkai Maru* for Shanghai and ports:—Hon. T. G. Grosvenor and wife, Mr. and Mrs. Hitch, Mr. and Mrs. Sasaki, Mr. and Mrs. Seki and two children, Mrs. Hawthorne, Mrs. Suda, Messrs. Santo, Okumura, H. W. Lea, Yamataka, Kobayashi, Hayaashi, Kambaga, Taki, Nino, Kawabara, Ah Tung, M. Sangster, G. Strom, and F. G. White.

Per French steamer *Volga* for Hongkong:—His Excellency Yanagihara, Mrs. Yanagihara and two servants, His Excellency Ida, Mrs. Ida two children and servant, Messrs. I. Ozaki, Hozaki, Magaki, Takata, Okubo, Watanabe, R. Niva, Tsudji, G. S. Smith, Harley, Ah Tai and Ah Chong.

Per Japanese steamer *Suwida Maru* for Hongkong via Kobe:—Mrs. Okuhara and son, Messrs. T. Winkler, Hori, Fukuma, H. W. Hagart, E. C. Kirby and Kobayashi.

## CARGOES.

Per American steamer *City of Peking* from San Francisco:—Cargo ... 2,178 tons

Per British steamer *Malacca*, from Hongkong via Nagasaki:—

Local ... 7,631 pkgs.  
 Transhipment ... 714 "

Total ... 8,345 pkgs.

## REPORTS.

The *Pym* reports: Left Antwerp on the 27th of June; had strong E.W. gales in the Channel; light N.E. trades, and crossed the Equator on the 9th of August in long. 25 W. Had light S.E. trades, and on the 27th of August, in lat. 33 S., experienced a severe westerly gale which lasted for many days, the ship having to be hove-to at intervals. This weather continued for six weeks, while the ship made her easting on the 41st parallel. Arrived at Banjowangie on the 26th of November: had light winds and calms through the Macassar Straits, and having got through the Serangani Straits, steered a N.N.W. course, but next day found the ship by observation to be 29 miles S.E. of her position, and on the following day 75 miles. The current which carried her so much out of her course, brought her into a deep bay in the island of Toulour, some 90 miles S.E. of Mindanao. There the vessel was imprisoned by the currents and winds for three months although several attempts were made to get her out. While lying there the natives, who were friendly, supplied the ship with fresh provisions, and, on leaving, the master took the son of the Rajah of the island, named Moros Sarijn, and a German missionary's son as passengers. The vessel got out on the 9th of April, but through the strength of the current the vessel was 29 miles South of her position two weeks afterwards. Came outside of the Philippines with light winds and calms, and experienced variable moderate winds to the coast of Japan. Arrived in port on the 31st of May. Passage 333 days. On the 26th of October, at 6 p.m., the carpenter, a Swede, named Fogelstrom, fell from the jibboom overboard. A life buoy was thrown, but he failed to reach it, and the second mate jumped after him with a line; the boat was also lowered, but without avail: the unfortunate man sank before he was reached. The ship's crew are all in good health despite of the long voyage.

The British barque *Lord of the Isles* reports: Light winds and fine weather throughout.

The P. & O. steamer *Malacca* reports: Left Hongkong on May 18th, at noon. Arrived at Nagasaki, May 23rd, at noon. Left at midnight of same day, and arrived in Yokohama, May 26th, at 9.15 p.m.

## REPORT OF THE MINISTER OF FINANCE, FOR THE FIRST EIGHT FISCAL PERIODS OF MEIJI.

TO the mere casual reader it will appear a work of supererogation to publish national accounts of periods, the latest of which is now five years old. But the more thoughtful observer, will see in their preparation and issue, a laudable desire to prove, first to His Imperial Master, and then to his countrymen and the world at large, the honest, large-minded desire, to place everything connected with the Okurasho—the Financial Department of the Government, clearly and undisguisedly before all scrutinizers, that has actuated Mr. Okuma, the late Chief of the Department.

The circumstances under which that gentleman took charge of the national finances, will doubtless be remembered by many. His predecessor had resigned, sending in a memorial to the Daijokwan, declaring that the financial condition of the country was alarming, and that the accounts showed an annual deficit of over two million rios a year. This was a statement well calculated to cause consternation among the ministers, none of whom had been accustomed to think much about this vast and important subject, and probably were quite satisfied that they had, in Mr. Inouye, a man well able to cope with difficulties that they were aware surrounded this particular branch of the Government.

One of the greatest difficulties that had to be met on the change of Government in 1868, was that connected with finances; and at the very time when Keiki, the recently recognized Shogun, was on his way to Kioto from Osaka, when his army preceded him, and came into con-

flict with the Imperial troops at Fushimi, and that battle was fought which drove him altogether from power, and office, and made him a fugitive, he had received an order from His Majesty to return to Kioto, for the very purpose of making him a *Gijo*, or Counsellor, with the view of arranging with him the best and fairest means of transferring to the Imperial Government the vast revenues of the Tokugawa family, which had paid all cost of Government heretofore, and seemed the only source from which immediate supplies could be derived. The disobedience of Keiki, in attempting to go accompanied by a large force, instead of by a moderate retinue under the protection of the daimios of Owari and Echizen, who had been the bearers of the Mikado's orders to him, upset everything; and led to that conflict which compelled the Government to seize by force what might have been placed in their hands after a just and liberal apportionment to the Tokugawa house and its hereditary retainers.

It may be well understood that, to a number of men, hastily thrown into the form of a Government, most of them more renowned for their zeal in the battle-field than for any administrative ability, the question of ways and means was a peculiarly perplexing one. The system that was being so ruthlessly overturned was one which now left the Mikado, the sovereign of the country, absolutely powerless to raise the smallest amount, either for his own or for national purposes. The Yedo Government received all taxes, and bore all expenditure. The Mikado had an allowance, like a mere pensioner. The treasury was not, as in other countries, a strong room filled with gold and silver; nor was the money placed in the hands of a national or any other bank: but it was in the shape of rice stored in large godowns in Yedo, received from the other provinces. As yet these warehouses were in the hands of the late Shogun's officers, and were not given over to the Emperor until the southern army reached the city, and the Commander-in-Chief consented to refrain from sacking it, on the condition that the Tokugawa would hand over everything peacefully.

The accounts, then, that we have before us, are from this period—from the 21st February, 1868—that is from a few days before the battle of Fushimi and the flight of Keiki. Mr. Okuma, in sending in the report to the Daijo Daijin, says:—"In the early days of the restoration, we were eager to correct the errors committed in the latter period of the Shogunate, and thoroughly to reform our financial policy. A civil war had broken out in the north-eastern provinces at the time of the restoration, and all affairs were in great confusion. Owing to these events, we could not occupy ourselves in preparing minute accounts of the revenues and expenditures." And again:—"Moreover the creations, abolitions, separations and amalgamations of Kuwan (Government), Shu (Department), Fu (cities) and Ken (imperial provinces) were of constant occurrence. The growth of home and foreign business, the development of army and navy, the reformation of the

judicial department, and the initiation of various works of public utility, such as railroads, telegraphs, etc., followed each other in quick succession. Especially in the Government of the different localities numerous improvements were made: in fact it is next to an impossibility for men to remember all the changes. The countless alterations were all, more or less, connected with financial affairs."

These are patent facts. They remind us, however, of the immense task that was cast on Mr. Okuma, when he was appointed to the office vacated by Mr. Inouye, with instructions to make a searching examination into the whole finance system, and to ascertain whether things really were as bad as had been represented. How faithfully, how energetically, how inquisitorially he entered upon his duties, the report before us shows. He, first of all, fixed his attention on the statement of his predecessor, and examined it item by item. At the close of his particular investigation, he was able to present a statement showing a very difficult result. Instead of the deficit of two millions of rios, there was a surplus; and there was no reason whatever for supposing that there was any extraordinary difficulty in keeping revenue and expenditure on even terms. The mistake made by the former minister apparently lay in valuing the rice in the Government godowns at too low a price. We are therefore prepared to see that, in the accounts now presented to us, this was one of the important matters which had first claimed Mr. Okuma's attention. The real importance will be recognised by the figures he gives in his preliminary explanation. The Han were abolished in the seventh month of the 4th year of Meiji. Before that "the number of *koku* of rice which came under the direct control of the national treasury was 8,906,000 in round numbers. After that event it increased to 82,805,000."

Besides the necessity of ascertaining the average price of rice during each financial period, was that of bringing all finance under the direct management of the Government. Hitherto, the rule had been "that the Fu and Ken, which were under the direct control of the Government, collected taxes in money and kind, and forwarded the receipts to the Exchequer, often deducting the sum for their own expenditures;" so that "the sums which were kept in Fu and Ken and spent directly for local purposes were not accounted for in the national revenues and expenditures."

The explanations given by Mr. Okuma of the items that seem to require them are so lucid and complete, that they carry conviction with them of the earnestness and integrity of the man. In many instances they are necessary, but we have not space to avail of them to any extent. It must suffice that there they are, and can be referred to by any into whose hands the Report may come.

The accounts and the explanations are divided into two books and an appendix—the first book giving the revenues and expenditures for the "eight fiscal periods," with "important events in relation to National finance;" the second, "explanations of every section of the actual accounts for each year," and "a comparison of the actual accounts with each other for the last three terms." The appendix details successive reforms in finance.

It is impossible not to be struck with the clear manner in which each kind of tax is arranged under its special head. Whether this is the result of foreign teaching, or the emanation from the native love of order we know not; but no foreign chancellor of the exchequer could improve very much upon it. It is easy to turn to any impost and find the amount received from it, and then to refer for explanations to the proper place.

There is no particular end to be served by quoting the figures to any extent. It cannot be of any interest to foreign readers to analyse receipts and expenditures of long past years, and particularly when the circumstances of their collection or disbursement, and the causes of their variations, require lengthy and minute description even in the Report itself.

Roundedly then the figures stand thus:—

The Grand total of Receipts for the 8 years	Yen 406,230,833.516
amount to .....	
" " " Expenditure .....	339,446,682.548
Excess of revenue over expenditure.....	Yen 46,904,170.973

This is a statement that might be received with incredulity, considering the fact that Mr. Inouye had found it hopeless to attempt to make both ends meet. Yet it must be remembered that it is the result of an inquisitorial investigation of the the entire system of finance, its collection and distribution, such as has really been carried out by a well-ordered government, and by a resolute, patient, and unswerving minister. There can be no object in falsifying anything; and there is a very decided advantage in telling the whole truth.

It was well that Mr. Okuma was at hand to take the finance in charge, and that he was willing, when called upon. He found his particular groove whatever other ministers had done; and he has remained in office ever since, steering the country through troublous times, finding means of raising money as required even for extraordinary demands, and preserving it by a keen watchfulness, and by a constant improvement in the national book-keeping from running into dangers which evidently have threatened it more than once.

Now, looking at the revenues let us see what they consist of. They are

Land Tax .....	232,711,463.416
Customs .....	8,497,665.084
Miscellaneous taxes .....	17,215,520.717
Income from Government Works.....	6,766,102.899
Repayment of ordinary Loans .....	2,551,932.366
Income from Government property .....	6,386,220.253
Ordinary Miscellaneous Income .....	8,731,945.247
Paper money issued .....	73,325,444.100
Loans .....	21,259,982.568
Repayment of extraordinary loans .....	16,533,689.968
Receipts of Bakufu and Han property .....	9,071,565.514
Extraordinary Revenues.....	3,289,299.384

Total .....406,230,833.516

And the expenditure was as follows:—

#### ORDINARY.

1. Kuwan and Sho.....	28,639,872.800
2. Army and navy.....	47,820,674.717
3. Local Government .....	38,753,089.545
4. Legations abroad .....	1,373,962.192
5. Redemptions and interest of Loans .....	8,721,936.831
6. All pensions and aids .....	93,270,804.808
7. Buildings, and repairing river banks .....	12,112,624.587
8. Rewards, relief, and advances for assistance .....	5,030,901.046
9. Ordinary miscellaneous disbursements .....	5,093,738.892

Total of ordinary expenditures .....242,801,605.418

#### EXTRAORDINARY.

10. Expenses for suppressing rebellions, etc.....	12,940,947.340
11. Expenses connected with Bakufu and Han .....	14,949,886.289
12. Expenses for government works .....	28,380,664.131
13. Expenses of the Imperial progress to the east, officers going abroad, and of industries, etc....	7,832,597.607
14. Extraordinary loans .....	31,369,861.415
15. Repayment of money borrowed, and grants for the surrender of pensions .....	18,023,908.908
16. Extraordinary miscellaneous disbursements .....	3,127,211.435

Total of extraordinary expenditures .....116,645,077.125

Grand total of expenditures .....339,446,682.548

Among the items of expenditure are some that possess much interest for foreigners. For instance the expenses of the various, rebellions and expeditions; of entertaining foreign guests; of constructing public works—railways, telegraphs, the mint, etc., all these are given in de-

tail, but only the amounts paid for them in each year, and total spent upon them up to the period at which these accounts close. It has been a common remark with foreigners that the Japanese Government does not know, and never will know, what the railways cost. It is from these accounts quite evident, that the Government knows to a cent what they have paid for them. Whether they can say that they are aware that all the expenditure was what may be called legitimate is another thing.

Mines, lighthouses, foundries, dockyards, all made their demands on the young Government. Looking at the figures, one gets dizzy in contemplating all that was undertaken by the boy Mikado and his utterly inexperienced Ministers. No wonder, we all cried out against the pace at which they were going. Embassies established abroad; students sent thither; schools and hospitals inaugurated; the whole judicial system changed; the army and navy formed; the men armed with the most recent weapons, and clothed in a becoming manner; ships purchased; barracks built, all these and a hundred and one other demands upon them, and yet the country burning for a foreign war—Corea, Formosa, China, it mattered not; no wonder that Mr. Inouye found his head swim with these incessant demands upon him.

And yet the country has carried, or is carrying, through, all that it undertook. It opens one's eyes to the real vitality that must exist in it, to read this report, and analyse its figures.

Mr. Okuma has certainly not wasted the time that has been spent in its preparation; and he has done wisely in publishing it. If it be followed up at no very distant date with a continuation to the last completed fiscal year, the whole will be valuable to foreigners, as well as to his own countrymen.

It is generally understood, that, although he is no longer Okurakiyo, yet he still exercises supreme control of the Department. His resolution to have all public expenditure submitted to the Department before being incurred, is a wise one. Hitherto, each Department has ordered what it requires, irrespective of the Okurasho, simply demanding so much money. In future, this will be changed. The particulars of all requirements must be laid before the office that has to find the ways and means; and doubtless this will make a mighty difference in the amounts called for.

#### PATENT RIGHTS.

OUR attention is again directed to this subject which we have already treated upon previous occasions. In both Japan and China the inventions of foreigners are unscrupulously appropriated. A writer in a Shanghai paper has recently made a few comments upon the absence of any protection in the latter country for foreign inventions. He says that any person is there at liberty to infringe anyone else's patent rights. "It may be convenient to do so but it is not creditable." Mention is made of a very grievous case. An American whistling buoy has been sold to the Imperial Chinese Maritime Customs Department as a muster; and some more, it is said, are being made by a local firm of engineers on the same pattern. The writer speaks of the "smartness" of this operation which, he repeats, is not "creditabile," unless the Chinese Government intends to compensate the patentees. No doubt this matter will receive due consideration in the approaching revision of foreign treaties with the empires of the east. Both patent right and copyright therein should be secured to native

and foreign industry, invention, and research. It cannot be very gratifying to the firm of merchants,—agents for the buoy company,—who imported the sample to Shanghai, to know that they have thus ruined their own chance of future sales. It is of course possible that the Government, if properly approached, may compensate the manufacturers whose ideas it is appropriating. There is one point, however, which must not be lost sight of, that may militate to a not inconsiderable extent against the chances of western patentees effecting arrangements in this and other Orient countries. We believe that the very heavy royalties, asked for by an establishment of English buoy constructors, were a serious impediment in the way of the introduction of a useful signalling contrivance into this country. Certainly the Government of Japan, and probably that of China, would be only too pleased to act honorably or even generously in this particular; but there is no reason why their necessity should be made the opportunity of European and American patentees. A little consideration on both sides is necessary,—a willingness by either negotiator to meet the other in a fair and accommodating spirit, pending that readjustment of international relations which should include a safeguard for the rights of property in articles which have demanded special study and experience, ingenuity, ability and expense, to perfect. We have no doubt that many foreigners now in Japan would be glad to introduce, and do their utmost to encourage the sale of, special patented articles of use in all the departments of manufacture. As it is, they are sagacious in declining to waste time and money on the importation of specialities that, as in the case which we have now cited from China, or in the more familiar one of Bell's telephones, will not command a market, but will open a profitable field to counterfeiters and impostors.

As we have previously indicated there is no law to prevent Japanese manufactories, any more than exists to prohibit their bookwrights and publishers, from stealing the notions of foreigners, and copying their patented processes, with the result that, even without a prohibitive duty, they can far undersell the imported wares of the original inventors, whom the absence of patent laws now places at a great and grievous disadvantage. Designers have an undoubted right to ask this empire, as well as any other nation, to pay for what it takes from the contriver as well as for what it purchases from the manufacturer. But there is a more practical view of the question than this. The promulgation of patent laws would create a considerable revenue, in the taxation of foreign patents, while the office requisite for registration would not entail much labor or any considerable expense. The patent offices of the United Kingdom are opulent and princely institutions. On a previous occasion we wrote that laws are as necessary for the encouragement of native invention, and for the protection of native individual rights, as they are justly necessary for those of foreigners. Through their introduction a new field will be opened to the energy and skill of native genius; and with a knowledge that his study and perseverance may bring him the profits of a useful discovery or invention, the Japanese student, chemist, or mechanic will have every incentive to labour and research. He will feel that his brains can supply the need of capital, and that the accident of poverty need be no hindrance to future success.

This is still true; and we continue to trust that the revision of the treaties will include special provision for the protection of foreign and native inventors and writers. And if even the re-arrangement of the agreements should be delayed, the Japanese Government could, by in-

dependent action, secure the safeguard of the important interests of its own people and its western guests.

THE late Empress of all the Russias, whose death was announced by telegram received on Friday evening, was the daughter of the late Louis the Second, Grand Duke of Hesse, and Wilhelmina, daughter of Charles Louis, Hereditary Prince of Baden. She was born on the 8th of August, 1824, and had thus almost completed her fifty-sixth year. Her life can hardly have been a happy one, as, in matters of religion, she was a melancholy enthusiast. Added to this the fact that, from her early infancy she had been a chronic invalid, and her long estrangement from her pleasure loving, debonair husband, and there cannot be found many elements of felicity in her existence. Her conversion to, or adoption of, the religion of the Orthodox Greek Church, to which she became a passionate devotee, was the turning-point of her life. Her dislike of England was as intense as it was openly avowed; and many of the complications which have of late years arisen between that country and the land of her adoption will be traced, by future historians, to the influence which her peculiar circumstances enabled her to exercise. The result of the Emperor's neglect of his consort was that, whenever the latter asked a favour or urged the adoption of a measure, her wishes were gratified if they came within the region of possibility. There is no denying that a very important agent in European politics,—an agent whose influence was none the less because it was occult and mysterious,—has been removed from scenes of complication, trouble, and international jealousy. The death of the late Empress will be deplored by those whom her good qualities attached to her. She was the embodiment of many of the Christian virtues; but was neither sympathetic nor, in any but a very limited sense, amiable.

TWO much importance may very easily be attached to the memorial of Chang Chih-t'ung on the subject of the unfortunate treaty entered into by Chung How with Russia respecting Kulja. The fact of the document appearing, as it doubtless has by this time, in the *Peking Gazette* is of no moment in this connection, as documents on every conceivable subject are reproduced as a matter of form in that unique publication. We consider that this memorial may be taken, not so much as containing the official views of the Chinese Government, but of the party who are averse to foreign intercourse and have the most overweening confidence in the power and resources of the Middle Kingdom—a confidence which has survived, unshaken, the disasters and humiliations of over half a century. A perusal of the memorial shows that the supposed author reproduces all the old arguments in favour of maintaining as far as possible the seclusion of the empire. It is difficult indeed to believe, that Chang Chih-t'ung is really the author of the document in question. As a contemporary has aptly pointed out, "the absence of the customary cringing servility of expression is immediately noticeable; while, on the other hand, the forcible, dictatorial, and fearless character of the language employed is such as the Emperor or those near his person would be most unlikely to calmly brook, much less so completely to endorse, as asserted, if the document were indeed the veritable offspring of any Sub-Reader in China, however pure his motives or patriotic his soul. The chances are far greater that the bold writer would have incurred the loss of his head in reward for his temerity." The more reasonable supposition seems to be that, as the anti-foreign party have now a dominating influence in the councils of China, they have put forward this memorial, tentatively, in the name of

a subordinate. If Russia should recoil from pressing conclusions in the face of the covert threats held out, or if England should be tempted to interfere on the ground so cunningly presented that Russian success would be detrimental to British interests in India, then the memorial would have accomplished its object. On the other hand, the Government is not in my way compromised by the document. It is, or at any rate may be alleged to be, unofficial, and can therefore be repudiated, if necessary, without any loss of prestige. At the same time the memorial shews clearly and distinctly the very one-sided nature of the treaty entered into by Chung How, who seems to have resigned to Russia everything which China incurred vast expenditure and spared no exertion to obtain—a rendition of her ancient territory held in trust by Russia under special treaty provisions, not one of which afforded the slightest pretext for the concessions wrung from "a sluggish ambassador" (as Chang Chih-t'ung terms Chang How) in St. Petersburg. The strong reinforcements to the Russian naval forces in the China Seas are evidence that the repudiation of Chung How's treaty will not be acquiesced in by the northern power, and, unless China succumbs, hostilities are inevitable. Russia cannot afford to quietly submit to what would be considered by her central Asian subjects a serious rebuff from China; and any such course of action would probably light the torch of revolt in all the conquered Khanates and ultimately prove more disastrous financially than a war with China, in which Russia must eventually be victorious and obtain full compensation. If hostilities should break out the course of Japan, whatever the sympathies of the people may be, is clear and unquestionable; a strict neutrality should be observed under all circumstances and temptations.

THE officers of the *Vega* expedition included an Italian lieutenant, Mr. Bove, a young gentleman of large attainments and great energy, and possessing the full confidence of his distinguished chief. Since his return to Europe he has presented, in concert with Commandant Negri, the Italian Minister of Marine, the draft of a scheme for Antarctic explorations, the object being to explore southern lands and seas to the lowest latitude which it is possible to attain. Starting in May, 1881, if possible, the expedition after touching at Gibraltar, will enter the Atlantic, in which ocean deep sea soundings will be taken. Monte Video will, it is expected, be reached about the beginning of August. On the Plata a vessel will be engaged to carry supplies of coal to Tierra del Fuego, and at the end of September the expedition will again start on its course between Patagonia and the Falkland Isles, tending always to the South Shetland Isles. Here will begin the great labours and the most profitable investigations. Mr. Bove speaks of the certainty of the existence of land round a great part of the Antarctic circle, if not of the whole of it. A writer in the *Times* says that

"It will remain for the Italian expedition to solve the problem, to verify doubtful indications, correct those which are erroneous, to advance towards the south, and winter there. This the two projectors of the expedition think they will be able to accomplish. At the South Shetland Islands, which are well known, and are now the resort of many whalers, French especially, they hope that some day or other Italian whalers will be found. From the Shetlands the expedition will steer to the south-west, and endeavour to penetrate a line of land which was observed by Dallman, a Hamburg whaler, some few years since. Thence a movement will be made towards the land where Bellinghausen marked the lofty capes of Alexander and Peter, and the western lands observed by Wilkes in 1839. At this point a serious discussion must arise as to future movements. It would be desirable to coast along the land of Bellinghausen and, if there were any appearance of a "continued mass," to steam for the back of the islands which Wilkes

believed to exist, and thus enter on the south of Ross's Sea, where the winter might be spent. Should, however, expectation be disappointed, the winter might be passed on the Bellinghausen land, and preparations might be made for entering Ross's Sea. The intrepid voyagers think that with a strong vessel it would not be impossible to penetrate beyond Ross's Sea, and complete the studies which were made of the flora, the fauna, and the mineralogy of the Antarctic region. Having examined these lands and sea, it is proposed to move towards Adele, discovered by D'Orville in 1840, and here it is thought it might be possible to land and winter. Continuing their course to the west, they intend running along by the Southern Continent, where the existence of land is certain, and endeavour to penetrate through the ice, as did D'Orville, Wilkes, and Rossel. The hope is that canals on the ice might be found through which they might attain a remote latitude, or, running along them when massed into a continent, arrive at Kemp or Endermet, where they could pass the second winter. Before returning to Italy it would be necessary to find some port where to refit, and Hobart Town is suggested."

### THE CASTLES OF JAPAN.

**F**EW buildings remaining as monuments of past history are so laden with thrilling incident and fanciful association as the ruined castles of all countries, such as stand gaunt and tenantless on sea-crags or hill-side; gnarled ivy growing in their crumbling walls which the storm and sunshine of centuries have mellowed into harmony with the colouring of surrounding nature. They inspire emotions in imaginative minds kindred somewhat to the exciting impulses awakened by the measured movement of armed masses; the strains of martial music, and all the pomp and pageantry of war. Displays of modern warfare with its cruel murderous mechanism are indeed far less truly deserving of emotion than the silent testimony which these shattered strongholds bear to fearless deeds of daring and endurance, wrought long ago in the days when the imperfect machinery of war left scope for individual prowess and skill, and when each man's life was sold dearly, struggling hand-to-hand with his foe. Within those now deserted ramparts has been witnessed many a heroic deed of courage and endurance of privation; and around them has been enacted many a hard fought struggle in which undaunted bravery, and all the skilled contrivances of the ages of chivalry were present in the field. No wonder then that castles should be the favorite theme of ballad and of story. Not alone as scenes of heroism and self-sacrifice, but also as the scenes of chivalry and love are they known among poets and romancers. From the legends of the gallant knights of Spencer, who wooed and won fair ladies in their castle homes, to the tales and rhymes of Scott or the Tennysonian Idyls, these fortresses have been peopled by our favourite writers with devotees to the subtlest arts of peace as well as with martyrs to the cause of patriotic war.

The castles of Japan figure in the country's history with like stirring interest of incident. There is scarcely one stronghold still standing but has a special story of exploit, heroism and suffering. The rivalry of the powerful families and of the larger provinces, like the rivalry of towns in Italy, or of states in Greece, has been the cause, in the long warlike times of the nation's past, of covering the whole soil with numerous castles both small and great. Among the many hundreds which at one time existed, the ruins of some hundred or more are still distinguishable; but of these comparatively few remain in sufficient entirety to deserve still the name of fortalice. The wooden towers and battlements of many have been destroyed or become decayed by time, the sites being now marked only by those deep moats, grassy slopes and steep escarpments which exist, as indestructible as of yore. Some fortresses have been forcibly destroyed, their slopes broken down, and their moats filled up by successful generals or administrators in order to increase their own power by diminishing the chances of rebellion and defiance. Japanese castles are more notable, perhaps, as works of military engineering skill than as architectural constructions. The wide moats, often resembling large canals, have been cut through hard soil to a surprising depth, and the huge earthworks formed testify to enormous labour and expense. The bold stonework which faces the high slopes often reminds one, in its lithic massiveness, of the old Cyclopean masonry

of the cities of Grecian colonies. Portions yet remain to mark the extent, position and arrangement of the largest of the fortresses. At Osaka castle, built by Hideyoshi, immense blocks of stone form the walls, some in cubes of over twenty feet, showing that marvellous labour has been expended in quarrying and transporting them. These engineering works have stood long since battlements and building ceased to exist. There are, however, still many remains of the curtain walls, keeps and turrets, which form the most prominent and picturesque features of the city buildings. Their diminishing stories, and curved salient roofs, crowned with bronze fish or dragon-shaped terminals, present a bold quaint skyline which most other Japanese edifices lack. These military constructions, moreover, though but wood and plaster, are far more solidly built, and present a far stronger and more enduring appearance, with their broad plastered surfaces and narrow barred openings, than do the ordinary fragile erections of the country. Any one riding through the old gateways of the capital will be struck by the massiveness of the huge beams and posts, as well as the heavy gates and hinges of the portals. In some cases the circuit of the walls and gates originally enclosed the complete city, the neighbouring rivers being conducted in large artificial canals, so as to form the spiral moats round the town and castle. In others, the castles stand, mountain-fortresses, on the slope or crest of some steep hill with the city at their feet. Of these mountain castles many may be seen by the tourist who passes through the valleys of the hilly provinces.

The lowland castles comprise, within their inner moats, a wide space containing the barracks of the soldiers and the *yashiki* of the commanding officers, as well as temples, cemeteries, storehouses and the large inner tower or keep which formed the last resort for the besieged in time of war. Great skill and contrivance appears to have been employed to ensure the comfort and lengthened sustenance of the inmates. Excavations upon the sites of some of these old castles have revealed bronze pipes and aqueducts and other secret resources by means of which the necessities of long isolated existence were supplied. It is interesting to note the planning and contrivance by which these fortresses were disposed to protect the position as well as to study the details of their various defences. Fixed wooden bridges span the moats leading to the heavy wooden gateways, always flanked by turrets, the gateways themselves being so arranged with inner courts and side openings as to be well commanded, and to defy direct uninterrupted entrance.

Such of these monuments of military strength and feudal conflict as still remain in partial preservation will well repay the visitor, who will be able to gather from the history of past times some stirring story for each epoch.

### THE U. S. S. "ALERT" AT AWOGASHIMA.

**T**HE officers of the United States sloop-of-war *Alert* have lately been employed in an undertaking which will prove of considerable service to mariners, as it increases the knowledge already possessed of these seas. The *Alert* sailed from Yokohama on the 8th of May, for the purpose of searching for the San Francisco and Sylph Rocks, and a shoal reported to be in Latitude N. 31°53' and Longitude E. 140°32'30." Some doubt had been expressed as to the existence of these dangers and it was the mission of the officers of the *Alert* to set the question at rest. For the following notes of the cruise we are indebted to Lieutenant Hunter, the navigating officer of the *Alert*, so that the information may be regarded as authoritative. It is satisfactory to know that the most careful scrutiny failed to discover the rocks and shoal reported, although regular lines of sounding and observation were run for their supposed position; these dangers may therefore be removed from the charts where they have so long figured to excite the apprehensions of seamen. The special object of the cruise being accomplished, the officers of the *Alert* visited the little-known island of Awogashima, the southernmost inhabited island of that chain which extends south from the Gulf of Yedo, for the purpose of ascertaining its true position. Awogashima is about thirty miles south of the island named on the English Admiralty chart *Fatsizio*, but is known in Japan as *Hachijo*, and is the place where in the time of the Bakufu Government, political prisoners used to be exiled. On the 9th of May, a party of officers from the *Alert* effected a landing upon Awogashima and were hailed by the inhabi-

tants as the first foreigners who had visited the place. The position of the island is laid down on the United States hydrographic chart No. 529 as in Latitude N. 32°37', Longitude E. 139°49', but the observations taken on the spot show that the true position is in Latitude N. 32°29', Longitude E. 139°44'49". The longitude is subject to the correction of the chronometers for sea rates and depends upon the flagstaff at the British Naval Depot being in Latitude N. 35°26'33" and Longitude E. 139°39'24", a position assigned to it after careful observation.

Although the weather at the time the *Alert* visited Awogashima happened to be exceptionally good, a landing was effected with difficulty on the north-eastern side of the islands, the surf breaking heavily on the rocky shore, and it was subsequently ascertained that there is neither bay, cove nor inlet which would afford anchorage or shelter to a craft of even the smallest description.

The party of visitors went over the island and found that the natives, who were estimated to number altogether about two hundred, lived on the high land back from the shore in thatched houses of considerable size but kept in a miserably dirty state. These unfortunates may be said to be almost entirely cut off from the outer world, their island produces nothing but a small quantity of raw silk in addition to what supplies their absolute necessities. For water, the people have to depend upon the rainfall, and fuel is very scarce.

The north-western part of the island was also inspected and found well cultivated as compared with the remainder. The highest point at this end was ascertained to be 905 feet above sea level. Time unfortunately did not permit of the southern portion of the island being visited.

Altogether Awogashima must be an extremely unpleasant abode, the inhabitants look half fed and half clothed, they are exposed to great vicissitudes of climate, extreme heat in summer and biting cold in winter, they are also to a great extent shut off from communion with the fellows, and are the most wretched boorish-looking Japanese ever met with. They seem entirely devoid of amusements to while away the dreary monotony of their existence. The occupation of fishing even is almost denied them; so dangerous is the coast that there are few days when a boat can leave, or land on the island. We understand that the *Alert* has orders to clear up many more unsolved problems, such as the supposed existence of the San Francisco and Sylph Rocks. No more suitable occupation could be allotted to a man-of-war in these "piping times of peace," and it will be a satisfaction to every one that the task has been entrusted to such competent hands as those of Commander Huntington and his staff.

#### RACING NOTES.

By DARK.

AS the first meeting of the "Nippon Race Club" is now so near at hand, the public generally have been daily expecting to see a few sporting notes from the widely celebrated pen of the "Sporting Editor," or from the somewhat more unruly quill of the usual "own correspondent" of the *Japan Gazette*. These not having appeared, I have endeavoured to cull a few hints from some of the *knowing ones* as to the prospects of the coming meeting. Various opinions have been expressed; some talk about a glorious meeting which will be carried on with *éclat*; others say that there is not a pony on the course that can get out of its own way or keep clear of its own hadow, while the number of ponies that "I have seen over and over again" do the five furlongs on the outside in just under 1. 23, is almost astounding. The best criticism on the prospects of the meeting was, however, made by one of the *fair sex*—without whose enlivening presence even the Gold Cup at Ascot is but a tame affair—who in reply to the hundred-times-and-again repeated query, "Do you think there will be good races?" replied naively, "The racing may not be good, but I hope there will be plenty of people to look on;" and in this sentiment I cordially agree. On looking through the entries I find that in all forty-two ponies are nominated, and of these such a number are selected from the Imperial Household stables, the Rikugunsho, or are owned by Japanese private individuals, that was in Yokohama cannot tell much about them, by name, until the Official Race Book is published, but those who have from time to time attended the meetings at Mita and Oyama, will doubtless recognize

some of the winners at these pleasant little reunions. On one point, however, the Committee of the N. R. C. may be congratulated and that is that their first meeting will bring together a finer collection of native and half-bred ponies, than has ever before been seen on this course. The griffins that have been brought down to Yokohama, purchasers have to take them all in all, are not worth looking at and only one has found a purchaser for racing purposes: he has been appropriately named the "Coming K." with, the hope that he may come to the fore some day.

The old ponies whose names are "familiar in our mouths as Household Words," all appear to be in good working order, and will doubtless win their fair share of the races. Mr. Angot's ponies—most of which we have seen before—are looking well so far as one can see, but there appears to be a superfluity of elastic, and swollen bandages and sundries about them, which is somewhat puzzling to the uninitiated. Among the China ponies that have not yet run here are *Cynosure*, *Clown*, and *Daisy Chain*. The first named ran very well in Hongkong about fourteen months ago, but broke down badly in the training here last Spring, and may or may not have now recovered his one famous turn of speed for three-quarters to one mile. *Clown* was trained in Shanghai for the last meeting there, but did not run; and is therefore with *Daisy Chain* a fresh aspirant for turf honours. They will, however, have all their work out of to run in company with the old ponies.

The Committee have been energetic in making improvements in the paddock; and although the grand stand is but a sorry building, everything has been done to render it as comfortable as possible for the meeting, and many requisites have been attended to, notably the new arrangements for carriage accommodation. With fine weather we should have an enjoyable meeting, after which we hope that the funds of the club will be able to afford the erection of a permanent Stand, good stables and other inducements to make racing in Yokohama what it was the good old times of '68 to '72.

#### JAPANESE PERSONAGES.

X.

HIS EXCELLENCY INOUE KAORU.

HIS Excellency K. Inoue is a Choshu man by birth, and very little is known about the earlier part of his life, but he always had the reputation of being possessed of good financial capacity. In the time of the war of the Restoration he fought on the side of the Imperial party, and greatly distinguished himself by gallant services. After the war was over, he was appointed Vice-Minister of Finance and placed in sole control of his department. It must be remembered that the newly organized Japanese Government, in succeeding to that of the Bakufu, found the national resources impoverished and in great confusion. Financial administration in that time must have been a very difficult matter, and it was entirely owing to His Excellency's ability that reforms were introduced into the treasury. Shortly afterwards Mr. Inoue, regarding the future state of Japanese finances as unhealthy, memorialized the Government on the subject, and his scheme being disapproved by other members of the Cabinet, he at once resigned his office, in which he was succeeded by Mr. Okuma Shigenobu.

On his retirement into private life, Mr. Inoue started a commercial firm under the name of the Senshu Kwaisha, in the control of which he displayed great commercial ability. Afterwards he was appointed a member of Senate. In 1875, the Koreans fired upon the Japanese man of war *Unyo Kan*, while she was surveying the coast of Kokwa-su. This outrage resulted in a conflict between the Koreans and the Japanese, the latter successfully and very easily defeating the former, and taking possession of an island on the coast, occupied by a Korean force. A great many Koreans were killed. A Japanese mission to the peninsular kingdom was decided upon in the following year. The subject of this sketch was appointed Vice Ambassador under His Excellency General Kuroda Kiyotaka, and the expedition had a satisfactory and peaceful termination. A treaty of commerce and friendship was concluded between the two countries. On his return Inoue resumed his functions in the Senate. He was next sent to England, where he remained for some years. The assassination of the late Home Minister, Okubo Toshi-

michi, in 1878, having caused a vacancy in the Ministry of Home Affairs, His Excellency Ito Hirobumi was transferred to that Department from the direction of Public Works, and Inouye was recalled from Europe, and nominated Privy Counsellor and Minister of Public Works. In the latter part of last year he was removed to the Foreign Department in place of His Excellency Terashima. This office is rightly considered a very important one at the present day, when the revision of the treaties is in contemplation; and though changes were effected in the Ministry in the beginning of this year, they did not affect the subject of this memoir, who retained his functions both in the Privy Council and the Department of Foreign Affairs.

#### CORRESPONDENCE.

#### SANITARY REFORM IN JAPAN.

TO THE EDITOR OF THE "JAPAN WEEKLY MAIL."

DEAR SIR,—In a letter published in last week's *Mail* Mr. A. J. C. Goerts has attacked with no small violence a lecture of mine on the above subject. That lecture was delivered to students, and neither was, nor proposed to be, more than a simple statement of the main principles of sanitation, from an engineering point of view, with special reference to the present very urgent needs of Japan. I did not think that anything in it could possibly hurt the susceptibilities of other advocates of sanitary reform. Nevertheless, it has drawn Mr. Goerts out of his habitual seclusion, and has subjected you to a communication which, with its appendices, fills ten columns of your space, and is nearly two columns longer than the lecture itself.

Mr. Goerts asserts, and endeavours to prove, two not very consistent propositions: First, that the point which I chiefly tried to enforce in the lecture was untrue; and, second, that what I said had all been said before by him.

As to the first of these charges:—I said, as the starting-point or motive of my lecture:—"The engineering aspect of sanitary reform in Japan has not yet received the attention it deserves." This statement is so obviously true to any one who has given attention to the matter, that it is not a little surprising to find Mr. Goerts asserting instead "that the engineering aspect of sanitary reform in Japan has not in principle been neglected, but has in reality received the attention it requires." One naturally asks:—"What is sanitary reform, in principle?" We know what it is in practice, but evidently Mr. Goerts is not speaking about that. The solution however comes later on, when he proceeds to endeavour to prove his case. He says "the Central Board of Health . . . is composed of medical and chemical men, *one engineer* (the italics are his), a police officer, and a secretary of the Department, as will be seen more in detail in the official notification . . ." Now Mr. Goerts can scarcely be ignorant that there neither is, nor has been, any engineer on the Central Board of Health. The engineer member has no existence except in the official notification of the constitution of the Board. I suppose this is what is meant by the adoption of a sanitary reform "in principle." We have another illustration of his meaning when he tells us that Mr. van Doorn's plan of iron water-pipes for Tokio (of which by the way I was quite well-aware) has been adopted "in principle," but not in practice, on account of its cost. Again, further on, he assures us that "it is the intention to appoint gradually in each *Ken* and *Ken* . . . one engineer," &c., "but," he is careful to add "as for the moment a sufficient number of competent men could not possibly be found to fill the respective posts in the various *Ken*, it is clear that the measure, although adopted in principle, can only gradually be put in practice." His way made easy by these gathered good intentions, Mr. Goerts advances upon me with the triumphant question:—"How then can Mr. Ewing write that the engineering aspect of sanitary reform in Japan has not received the attention it requires?"

The second of the two charges cannot be better stated than in his own way:—

"Many very true remarks are made by the author . . . but we find exactly the same remarks in the reports of the Yokohama

Board of Health, and in my own paper on the drinking water of Yokohama."

"The ameliorations advocated by Mr. Ewing in his lecture were recommended by me and others long before he gave his lecture."

"Although these remarks are perfectly true, Mr. Ewing does not say that I stated this fact already two years ago."

"There can be no objection to Mr. Ewing repeating the statements made by me and others, but we should like to have then the source mentioned, in such a way that the reader may know to whom the matter is originally due."

"I beg to state that I have pointed out the same defects and that I have recommended the same improvements a long time before Mr. Ewing's lecture."

"The lecture is merely a repetition of what has been written before by me and others."

The fourth and fifth of these quotations refer to a passage in my lecture where I said, and showed by experiment, that the observed progressive impurity of the Tokio water as it passes through the system of pipes, was probably due chiefly to the back flow of contaminated water from the distributing wells. This explanation was, I believe, originally suggested by Dr. H. Faulda (*Trans. Asiatic Soc. of Japan*, Vol. VI page 101). So far is it from being due to Mr. Goerts that, not only does he not mention it eighteen months later when accounting for the impurity of the water of Yokohama, but in his letter to you he misrepresents my statement of it in a way that shows he has even now failed to apprehend the point of the explanation.

The other sentences quoted above refer to parts of my lecture in which I tried to explain to an audience of students the most obvious applications of sanitary science to the requirements of Japan. No doubt most of those things have been said before, and no doubt also they will have to be said again and again before any action is taken in the matter. When one points out the evils of stagnant gutters or polluted soil, he does not expect to be accused of plagiarism, and I am sure Mr. Goerts has some more enduring title to fame than his discovery that "the drains now in use are leaky in many places," or even his bolder generalisation that "the proximity of the gutters to wells and dwellings make them still more dangerous to health," which he has quoted in order that the fount of my inspiration may be seen. I did give a general reference to his paper on the drinking water of Yokohama, but I could not acknowledge it as the source of ideas I did not take from it, still less of ideas which were not in it.

I should have left Mr. Goerts' letter to expose itself, had he not done what is happily unusual in public discussion. Speaking of the removal of excrement, I said "the system now in use is, I think, by no means a bad one, if it be properly carried out, and any sweeping change such as the introduction of the foreign water-carriage system—even if it were practicable—would be a more than doubtful advantage." With this before him Mr. Goerts writes:—"There is one original feature in this lecture, and that is Mr. Ewing's opinion that Japan . . . ought now at once to possess all the modern system of sewerage and drainage, which we admire in some of the more advanced European states." Even this is not the worst. Mr. Goerts gives some nineteen sentences which profess to be quotations from my printed lecture, and of these more than half do not exist in the lecture at all. I do not mean that the sentences are altered by the mere elisions which are permissible in quoting; they are mutilated in sense, form, language, and grammar. In several cases they are so changed that the idea in the text is completely misrepresented; sentences which are not mine either in meaning or expression he has quoted, with inverted commas, as part of my lecture. I do not much care for perversion of meaning or motive, but Mr. Goerts might have spared my grammar, and not have credited me with verbal eccentricities which are peculiarly his own. The least that one can ask of a critic is that he should quote correctly. To misquote, not once but often, and to attack not what was said, but the misquoted version of it, is, at its best, very culpable carelessness.

Yours very truly,

J. A. EWING.

The University,  
Tokio, June 1st, 1880.

## SANITARY REFORM IN JAPAN.

TO THE EDITOR OF THE "JAPAN WEEKLY MAIL."

SIR.—Will you allow me a little space to correct a misconception which Mr. Geerts, in common with some others who seem not to have read Dr. Martin's paper on the water supply of Yedo, are labouring under. Mr. Geerts says:—"Why does Mr. Ewing neglect to mention the earlier analyses, made (in 1875) of the Tama and Kanda waters by Dr. Martin, who was then attached to the Government Sanitary Laboratory, and who published the results in the Transactions of the German Asiatic Society." "Dr. Martin has demonstrated earlier than anybody else, that the water of the Tokio aqueduct loses its original purity in its course through the wooden pipes within the city." I have no doubt that Mr. Ewing is quite able to answer Mr. Geerts' question for himself, but I wish to point out that the claim which is made on behalf of Dr. Martin is quite misleading.

Mr. Geerts does not give the exact reference to this paper, but I must assume that he means that which appears in the 11th Heft of the German Asiatic Society's Transactions of the date November 1876, not 1875. It would be a misconception of the relation which my analyses bear to those by Dr. Martin, even if his were much more extensive than they are, to suppose that their publication a year before mine, could render the latter unnecessary. During the autumn of 1877, Tokio was visited by a severe epidemic of cholera, and it was especially in connection with that circumstance that it was thought desirable to know something about the quality of the water supplied to the inhabitants of this city. I must admit that at that time I had no knowledge of what Dr. Martin had done, but very soon after the publication of my paper I was kindly told that "all that had been done before," a piece of information which, of course, made me consult Dr. Martin's paper. As the above opinion seems still to exist in the mind of Mr. Geerts, I think it desirable to point out, what can readily be seen by any one who is sufficiently interested to compare the two papers, how totally different they are in their aims and in their results.

Dr. Martin commenced with a brief and pretty accurate account of the water supply, and the analyses he gave amounted in all to three;—two of the water from the Tama supply; and one from that of the Kanda;—besides which he added the degree of hardness of seven surface waters. Except the statement that the original Tamagawa water gave no reaction with Pormanganase, and that the organic matter of the Kanda water amounted to 0.07373 grammes in 10 litres, there were no results given which bore in the least upon the suitability of the water for drinking purposes. All the other numbers merely showed the proportion of mineral salts dissolved in 10 litres of the water, and it is hardly necessary to explain to the readers of the *Japan Weekly Mail*, after the frequent discussions which the subject has given occasion to, that, within moderate limits, the amount of mineral salts present gives no indication of the potable quality of the water. The only possible exception to this statement is in the case of the presence of chlorides and nitrates, the latter of which are products of the oxidation of the nitrogenous organic bodies, and as such, are, therefore, perfectly harmless, but which are regarded as pointing the finger of suspicion to the water as having previously been impure. Dr. Martin determined (by what process he did not mention) the amount of nitric acid contained in the water at the end of the Tama supply, and decided that it was quite normal ("in sofern durchaus normal"). The amount of solid matter in the original Tama water he stated to be 0.35137 grammes in 10 litres, and 0.4613 grammes in 10 litres at the end of the supply. From this very moderate increase in soluble solid matter, from the absence of sulphate of potassium, and from the small amount of alkaline chlorides, Dr. Martin considered that he had proved "*dass kein directer Erguss von Uebersaesser hinein stattgefunden, sondern es vielmehr die, dass kleine Risse im Netzwerke oder porösen und vermoderten Holz eine art Diffusion zuzwischen dem Wasser in den Röhren und der umstehenden Feuchtigkeit hergestelltt haben.*" It will be seen upon what meagre experiments Dr. Martin based his opinion that the water becomes impure by leakage and diffusion, rather than by direct contamination by impure water. Neither the

amount of mineral matter, nor the amount of nitric acid found by Dr. Martin in the Tama water at the end of its course, would lead one to suppose that the water was unfit for drinking, a judgment which could be founded only upon a knowledge of the amount of chlorine, free and albumenoid ammonia, and nitrates. Such information was given in my paper, not for one or two places only, but for water collected from fourteen different points on the two supplies, and it proved conclusively that the impurity increased in amount progressively with its distance from the source. I am quite willing now to leave the matter of in the hands of your readers.

I am, Sir, &c.,

ROBERT W. ATKINSON.

University of Tokio, 1st June, 1880.

## EDUCATIONAL PROGRESS.

TO THE EDITOR OF THE "JAPAN WEEKLY MAIL."

SIR,—I noticed in last Saturday's *Weekly Mail* a letter, signed "A. J. C. Geerts," which seems to contain a good deal of hitherto unpublished official information. Among other things the writer says:—"Japan has made enormous strides in the education of its people. From the poorest peasant child to the highest in rank, all go to school in this country." During the year 1877, according to the last report of the Minister of Education, only 39.9 per cent. of the children of school age received instruction, while 60.1 per cent. did not: so I infer that there must have been an increase amounting to something over a hundred and fifty per cent. since then. It is too bad of the authorities to have kept back such gratifying news, and only now to let it leak out through the Benton Laboratory in this accidental way; still: I cannot but offer them the hearty congratulations of

A DELIGHTED FRIEND OF EDUCATION.

Tokio, 3rd June, 1880.

## REUTER'S TELEGRAMS.

LONDON, 2nd June, 1880.

The Onks:—*Jenny Howlett*, first; *Bonnie Marden*, second and *Warhorn*, third.

An international conference will be held in Berlin on the 15th of June, to discuss the Greek frontier question. The Ulemas,—Mahometan fanatics,—counsel resistance to the demands of the Great Powers.

## NOTES OF THE WEEK.

## BIRTH.

On the 3rd instant, at Iida Machi, Tokio, the wife of Jas. ELLERTON, Jr., of a son.

The M. M. steamer *Tanis* and O. and O. steamer *Belgie*, arrived from Hongkong on Monday last. The P. and O. steamer *Malacca* left for Hongkong on Friday, and the O. and O. steamer *Belgie* for San Francisco this morning, at nine o'clock.

We observe in the Hongkong *Daily Press* an obituary notice of and able and accomplished author on eastern subjects, one well-known to the old residents of China and Japan:—

Mr. Robert Fortune died on the 13th April, at the age of sixty-seven. The deceased was born in the county of Berwick, Scotland, in 1813, and received his education at one of the excellent parish schools in that country. After completing his education he served an apprenticeship as a gardener, and after-

wards obtained employment in the Royal Botanical Gardens at Edinburgh. There he had good opportunities of obtaining a sound knowledge of botany and of the higher departments of his own profession, so far as they relate to the cultivation of sub-tropical and tropical plants under glass in a temperate climate, and these opportunities he was not slow to turn to good account. Shortly afterwards he was promoted to a post in the gardens at Chiswick, where his abilities and acquirements attracted the attention of London naturalists. In this sphere he acquitted himself with so much credit that in 1842 the Botanical Society of London despatched him to Northern China to make botanical exploration of the country. His journey was most successful, and he sent home a very large number of rare and valuable plants, some of which were quite unknown in this country. Besides this he became familiar with the varieties of Chinese life, and gave to the world in 1847 the result of his adventures in his "Three Years' Wanderings in Northern China." This work, which placed its author in the foremost rank of contemporary explorers, attracted much attention, and Mr. Fortune, who upon his return to England had been appointed curator of the "Physic Garden" at Chelsea, was in the summer of the following year entrusted by the East India Company with a mission to proceed again to China to make investigations relative to the cultivation of the tea plant. After an absence of more than three years he returned to England, and having published his valuable work entitled "Two Visits to the Ten Countries of China," he started once more to pursue his adventurous career, and prosecute his scientific researches. The results of this last journey are embodied in "Residence Among the Chinese, Inland, on the Coast, and at Sea; being the third visit from 1853 till 1856." The year following he was employed by the United States Patent Office on behalf of the American Government, to collect for them seeds, chiefly those of the tea plant in China and the East—a duty which occupied him two years, and which he discharged with considerable success. Mr. Fortune had been a frequent contributor to the columns of the *Athenaeum*, but his latest important work was published in 1863. It was entitled "Yedo and Peking, a Narrative of a Journey to the Capitals of Japan and China," and devotes special attention to the natural productions and agriculture of the districts visited.

On the 30th of last December, a London correspondent of the *London and China Express* wrote as follows:—

My correspondent in Yokohama writes me by the last inward mail that the three European banks there were closed on Monday, November 3rd, being the Mikado's birthday. So far so good. My correspondent also informs me that the banks were closed on Thursday, Friday, and Saturday, the 6th, 7th, and 8th November, thus being open for business only two days during that week. Very few, if any, of the mercantile community of Yokohama now attend these so-called "races." I should like to know if these interruptions to business obtain the sanction of the head offices here?

This effusion has attracted the attention of a commentator in this neighbourhood who might be a pseudo ecclesiastical functionary in *partibus*. Over the signature "Houoco" he thus replies:

Referring to the letter in your issue of January 2nd last concerning bank holidays, and apart from the fact that the banks here were not closed on the 6th and 8th November last, except in the afternoon, I should like to inquire from your correspondent, "Merchant," to what "races" the third sentence of his letter refers. Is it the "European Bank Race," the "Mikado's Birthday" Race, or the "Mercantile Community" Race, to obtain the sanction of their "head offices" for a holiday, which we all enjoy here, as much, perhaps, as "Merchant" enjoys his bank holidays at home?

A correspondent of the *Japan Daily Mail*, wrote on the 2nd instant from Shimogawa as follows:—

I have a black and tan English terrier bitch about four years old which has not had pups for 12 months. A few days ago I received a present of two very small kittens from a friend in Yokohama. The bitch could not bear the sight of them at first but, strange to say, last Monday I found her lying in the corner of a room with the two kittens sucking at her. Since then she will not leave the kittens nor nor let a stranger go near them and to-day I find she has plenty of milk for them. Several of my friends know the dog and have seen her sucking the kittens.

It will be useful to the public to know another simple test for oleomargarine in addition to that which we published some time since. An American paper says that "a good test is to heat the substance in a small fryingpan. Butter will gradually get brown and smell nicely, even when already beginning to burn black. Oleomargarine will never get brown, but will directly, if the heating continues, change from clear yellow fat to black, and emit all the while the odor familiar to those who live near

a fat factory. A little practice and attention will enable any person not only to distinguish by sight and smell between oleomargarine and butter, but even to find out the approximate percentage of the former, or of any other fat in any compound sold as butter."

A telegram was received last evening announcing the death of Her Majesty the Empress of Russia. This was not unexpected as the deceased lady had been in a most precarious state of health for some time past. The flags of the consulates and men-of-war will be at half-mast for two days.

The interest which attaches to the nomination for the Presidency made by the Republican Convention in Chicago, is probably responsible for the rumours current. Up to the present no telegram on the subject has been received in Yokohama, but, as we mentioned the other day General Grant's nomination is almost certain, as he has already carried New York and Pennsylvania two States which give him, we understand, fifty-eight votes at the Convention. As the candidate nominated must receive a plurality of votes the proceedings at the Convention may last for several days. It is not improbable that this will be the case on the present occasion, because there is a strong section of the republican party who are opposed, not to Grant personally, but to a third term, considering it contrary to the spirit of the Constitution.

Dr. J. B. Gill has written a small work on *Indigestion; What it is, What it leads to, and a New Method of Treating It*. This little manual abounds with useful information. Dr. Gill sets forth in clear and intelligent fashion the causes of indigestion, its results as affecting general health, and the best means for its prevention or cure. Like most specialists he is, perhaps, a little inclined to overrate the importance of the subject of which he treats, but this is pardonable, for his arguments are convincing, if his examples are a little exaggerated. For instance, he says "We meet an old friend in the street: we give him a civil greeting; he repays us with an acid rejoinder. "Poor old A.'s stomach is upset again," we kindly plead to ourselves in extenuation of his rudeness." This explanation of a friend's discourtesy might well be the true one, but most people, we think, would simply feel annoyed, and would not stop to speculate upon causes. Dr. Gill starts with the assertion that "indigestion covers the whole domain of medicine," and upon that ground urges the necessity of paying constant attention to the state of the stomach. To keep it in good working order the constant use of the bath is shown to be absolutely necessary. In fact, the "new method" for the treatment of indigestion consists in the outward application of water. Various kinds of baths are considered, and their merits contrasted. The sponge bath or "tub," dear to the hearts of Englishmen, is strongly recommended for the preservation of health generally, and as a safeguard against indigestion in particular. Dr. Gill is careful to say, however, that in cases when cold water produces blueness and shivering, tepid water should be substituted for it. The chapter on the vexed question of diet is the least satisfactory in the book. A number of hints are given as to what to eat and what to avoid, but the conclusion arrived at is in effect to what is one man's meat is another man's poison.

The engagement of Mr. C. J. Van Doorn as Chief Engineer of the Construction Bureau of the Home Department having terminated, he will be received in audience by His Majesty the Emperor who will thank Mr. Van Doorn for the valuable services rendered by him to the Empire during his residence in Japan. This afternoon, the Minister for Home Affairs will entertain Mr. Van Doorn at a farewell banquet in the Enriokwan, when all the officials of the department will be invited.

We were sorry indeed, to see so few assembled in the Gaiety Theatre on Tuesday evening; had it not been for our Scotch *élite* who rallied to greet their old compatriot, some ladies who generously braved the unpleasant weather, and the regular *habitués* whom we meet at every entertainment, the house would have been well-nigh empty. Mr. Black deserves better than "a beggarly array of empty benches;" for although the cynic may remark with a sneer that the artist is past his prime, yet for the sake of "auld lang syne" a larger proportion of the crowds who have filled the auditorium in years gone-by should have at

least shown their gratitude for pleasant evenings passed away. The programme was a regular *alla podrida* of songs—melancholy, sentimental, mad, merry and mirthful. We were sorry to find our old favorite laboring under indisposition. Let any one try an evening's monologue, with a racking toothache, and he will be able to make every allowance for shortcomings which will occasionally appear in the best regulated performance. Our best thanks are due to Mr. Vinay for so kindly undertaking the accompaniments; and if in all cases he did not quite catch the peculiar rhythm of "real" and "plauxy" (indeed who but a born Scot or Celt can?) or rise to the sublimity of Handel, yet all was atoned for by the concluding number performed *con amore* on all sides and accompanied *à merceille*.

Graphic accounts of the entertainment given by the Marquis Tseng, the Chinese ambassador in Paris, have lately appeared in the home papers. We read however that numerous thefts marred the success of the entertainment. "Almost all the ladies lost their pocket-handkerchiefs, umbrellas and hats were stolen without number, the Persian Ambassador lost his gold cigarette case, and the son of the Marquis Tseng had his toque, which was ornamented with many seed pearls and a handsome brilliant, stolen."

Religious ceremonies, when regulated by the formalities and etiquette of a Court are apt to lose much of their original significance, if not to degenerate into a mere farce. An English paper informs its readers that "the wretched beggars whose feet are washed every year on Good Friday by the King of Spain are the most unhappy of mortals. They are forced to take six footbaths a day for a week previous, and a whole army of chiropodists are let loose upon them to extract corns, polish, and perfume. This year a veteran Republican inscribed his name on the list of beggars desirous of having their feet washed by the King, and, the identity of the individual escaping notice, the 'Red' had the supreme felicity of seeing his Sovereign literally at his feet."

We read in an American journal that professor R. S. Roberts of Pittsburg has been conducting interesting experiments in using petroleum for a fuel in blast furnaces. He made many attempts with the Fanny furnace at West Middlesex, Mercer county, but was much disheartened by water accompanying the oil into the crucible of the furnace. He has, it is stated, at last succeeded and experiments made on Friday, the 2nd of April, proved that the oil can be injected into the crucible of a blast furnace in quantities of from ten to one hundred gallons an hour in each tuiere, minus water even in suspension; that its presence adds largely to the volume of the furnace gases, and increases their heating powers, and the very nature of it proves that its heating powers in the crucible of a blast furnace, are simply immense. Another fact has been clearly established, that crude petroleum used in the smelting of iron will dephosphorize it, which should bring the use of it as a prime factor in blast furnaces.

Those who were out soon after sunrise yesterday morning, says the Baltimore *Sun* of the 5th of March, when it was quite warm, with a mild atmosphere, observed thousands of worms crawling upon the streets and sidewalks. They were seen in great numbers in North Baltimore, on the solid pavement on North avenue, leading from Charles street to York road. They were very much like the common mud or fishing worm, varying in length from three to eight or nine inches, with quite a large, flat head and sharp tail, rough surface, from one-eighth to three-eighths of an inch in circumference, and brown in color. Some were dead or motionless, others moving. There was a peculiar shape and conformation about them, differing materially from the fish-worm. It was absolutely impossible for them to have come out through the solid Schillinger pavement—hence the hypothesis is they were rained down during the shower of Wednesday night, and must have descended from a mild atmosphere in the upper regions. When the sun's heat grew more powerful most of them died or withered into seeming inanimate nothingness and finally disappeared. Such a natural phenomenon, though rare, is within the recollection of many Baltimoreans. These singular creatures were seen by many persons in the city, as well as those residing in its suburbs.

We collate below and arrange in alphabetical order, from the fifth annual report of the Minister for Education, the names of all the cities and towns in the empire which in 1877 had a population of ten thousand and upward, giving the number of inhabitants, and (in italics) the name of the provinces in which the towns or cities are situated:—

The plague of rats in India seems to be as hurtful now to crops as it proved last year. We learn that what the natives call *musa-gardi*, or a plague of rats, has appeared in the Cawn-pore district. These animals cut down the corn, which is as yet unripe, and strip off the partially-formed grains. This is the more curious at this season as the grain is so far unfit for food and is left by the rats scattered on the ground. It is, however, disastrous to the prospects of the coming harvest, which are even now seriously affected by this pest. The natives estimate the damage done so far at about two musas in the rupee; but as there will be a month more before harvest, this estimate will not be likely to cover the loss to the cultivators, who seem helpless, looking on the whole affair in the light of *Kismet*.

A sexton in Gloucester, Mass., was summoned to prepare for burial an aged man with whom he was well acquainted. Arriving at the house he was requested to go up stairs to the bedroom where the body was lying. Up he went, and while removing his coat he was dumbfounded to see the supposed dead man rise in bed and in a hollow tone of voice articulate: "Hallo, John, how are you; Shake hands." The sexton was almost frozen with horror; but in a moment said, "I came up Sam, to see if you didn't want me to make a new kind of gruel." The sick man assented; the gruel was made and carried up, and the affair passed off. The patient lived until the next day, and when the sexton was again summoned there was no resuscitation.

We learn from the *Shanghai Courier* that Spanish papers state that it is proposed to establish a mail service between Cuba and China. It is not stated how the mails are to be conveyed. The British steamer *China* has been purchased for

the direct mail service about to be established between Spain and the Philippines, and will be the first vessel of the new line. She arrived at Barcelona from England in March, and her name is to be changed to the *Magallanes*. The *China* was built in 1861.

The Board of Trade Returns of Exports from the United Kingdom for the three months ending on the 31st of March last, show a gratifying increase in the Japanese consumption of British goods. The following are the principal items:—

EXPORTS.	QUANTITIES.		VALUE.

According to the *Hongkong Daily Press* the following are the members of the new Government and of Mr. Gladstone's last Administration:—

THE PRESENT GOVERNMENT.	LAST LIBERAL GOVERNMENT.
FIRST LORD OF THE TREASURY.	
Mr. W. E. Gladstone.	Mr. W. E. Gladstone.
LORD HIGH CHANCELLOR.	
Lord Selborne.	Mr. Selborne.
LORD PRESIDENT OF THE COUNCIL.	
Earl Spencer.	Lord Aberdare.
LORD PRIVY SEAL.	
Duke of Argyll.	Vincent Halifax.
CHANCELLOR OF THE EXCHEQUER.	
Mr. W. E. Gladstone.	{ Mr. R. Lowe. { Mr. W. E. Gladstone.
SECRETARY, HOME DEPARTMENT.	
Sir W. V. Harcourt.	{ Mr. H. A. Bruce. { Mr. R. Lowe.
SECRETARY FOREIGN AFFAIRS.	
Earl Granville.	Earl Granville.
SECRETARY FOR THE COLONIES.	
Earl of Kimberley.	Earl of Kimberley.
SECRETARY FOR WAR.	
Mr. H. C. E. Childers.	Mr. Edward Cardwell.
SECRETARY FOR INDIA.	
Marquis of Hartington.	Duke of Argyll.
FIRST LORD OF THE ADMIRALTY.	
Lord Northbrook.	Mr. G. J. Goschen.
POSTMASTER-GENERAL.	
Professor Fawcett.	Dr. L. Playfair.
PRESIDENT BOARD OF TRADE.	
Mr. J. Chamberlain.	Mr. John Bright.
CHANCELLOR DUCHY OF LANCASTER.	
Mr. John Bright.	Mr. John Bright.
PRESIDENT LOCAL GOVERNMENT BOARD.	
Mr. J. G. Dodson.	Mr. J. Stansfeld.
VICE-PRESIDENT COMMITTEE OF COUNCIL.	
Mr. A. J. Mundella.	Mr. W. E. Forster.
CHIEF COMMISSIONER OF WORKS.	
Mr. W. P. Adam.	Mr. W. P. Adam.
CHIEF SECRETARY FOR IRELAND.	
Mr. W. E. Forster.	Marquis of Hartington.
ATTORNEY-GENERAL.	
Sir Henry James.	Sir Henry James.
SOLICITOR-GENERAL.	
Mr. F. Herschell.	Sir W. Vernon Harcourt.
JUDGE ADVOCATE-GENERAL.	
Mr. Osborne Morgan.	Mr. A. S. Ayrton.

A startling surprise, after the fashion of the story of Ginevra, was experienced some short time ago by a party of Styrian wood-cutters in the forest of Drümmling. They began to fell a venerable oak, which they soon discovered to be quite hollow. Being half decayed it speedily came to the ground with a crash,

disclosing a skeleton in excellent preservation. Even the boots, which came above the knee, were almost perfect. By its side was a powder-horn, a porcelain pipe-bowl, and a silver watch on which was engraved the name "H. von Krackowitz, 1812." The teeth were perfect. It would seem to be the skeleton of a man between 30 and 40 years of age. It is conjectured that, while engaged in hunting, he climbed the tree for some purpose, and slipped incautiously into the hollow trunk, from which there was no release, and he probably died of starvation.

During the first quarter of the present year the value of the gold and silver bullion imported by Great Britain from Japan amounted to £154,950, as against £280,877 in the corresponding period last year.

In the action of Cocking v. Morgan, in which a point of much interest to shippers of goods is involved, judgment was given for the defendant. A full report of the proceedings will be found elsewhere in this issue.

The Smyrna correspondent of the *Times* gives a sad picture of the wretched state of the rural population of Turkey. The Christians are, however, better off than the Moslems. Of the latter the correspondent says that "in many respects their condition is worse than that of their Christian neighbours; for example, they do not enjoy, as do the Christians, the sympathy and influence of the Christian nations of Europe. Their sons are drafted into the army, while all Christians are exempt from military service on payment of a military or exemption tax. The Government shows as little mercy to the Moslems as to the Christians in the levying and collection of the tithes. An illustration of the heavy manner in which these exactions fall upon the people, I may mention one small Turkish village which I visited during or near the close of the late war. An old man gave me the names of 92 able-bodied men who had been drafted into the army from that village, not one of whom had returned. I visited another Turkish village, around which the grain was rotting in large piles, because the tithe-collector had a quarrel with the Government in regard to the terms of the contract by which he had bought the tithes of that village. These villagers were all simple-minded agriculturists; very few of them knew how to read. Yet why should they be made to suffer the evils of bad government? The Christians of Asia Minor have many and heavy trials, but I confess that the Moslem peasantry appear to me to suffer even more than do the Christians. My blood has often tingled at the recital of their wrongs, especially when I have remembered that the money which is wrung so mercilessly from them is squandered at Constantinople in idle and extravagant luxury. When I have asked myself what do these people need to make them happy and prosperous citizens, I have been compelled to reply—The first and the essential thing is good government. Most of them are industrious, most of them are honest and peaceable; the Moslems certainly are all loyal supporters of the authority of the Sultan, notwithstanding the real grievances of which I have spoken; but they are constantly appealing to a force which is used to plunder rather than protect them."

We notice in an English journal that the Master of the Rolls had before him recently an application of a Mr. Skipton, who sought to set aside a resolution of the committee of the Naval and Military Club, expelling him from the club. It appeared that Mr. Skipton had previously been expelled from the Hanover-square Club, on the charge of winning seven or eight thousand pounds at écarté from a guest whom he had invited to the club and made drunk. The committee of the Naval and Military Club investigated the charge, and expelled Mr. Skipton. Sir G. Jessel said he could not interfere with the discretion of the committee, and the action was dismissed with costs.

The *Heeres Zeitung* contains an article on the Brighton Volunteer Review, by a German officer who witnessed it, and who writes in the most appreciative way of all the Easter Monday operations. The steady, soldierly way in particular in which the troops marched past, after the prolonged fatigues of travel and fighting, elicits from this critic the heartiest praise, and he concludes by saying that, after seeing the Brighton Review, one could only entertain a favourable opinion of the military worth of the English Volunteer Army.

The *Philadelphia Press*, of the 27th of last March, says that "an excitement was caused this morning at the dock of the East river between Stanton and Rivington streets by the disemboweling of a large whale, which was towed through the Sound yesterday and brought down the river last night by the steam tug *Curtis*. The marine monster had been hoisted on a float at the side of the pier, and lay on its back. It is called by the owner a fine-back whale, and is a male. It measures sixty five feet in length, and before being disemboweled was over sixty feet in circumference at the thickest part. It is now over 15 feet through at the shoulders, and its lower jaw, which is fringed with a brush-like screen of whalebone, is about 14 feet long, the upper jaw being much larger. The eyes are not much over two inches in length, and the ears are even smaller. The tail has a spread of over 12 feet, and the captain of the police boat *Seneca* said that if that tail while the monster was alive had struck his vessel all dispute about her would have been ended. There were ten barrels of herrings taken from the inside of the whale during the morning, and it is no wonder that the fisherman were so anxious to destroy him. The color of the whale is mainly black, but some white places are to be seen. The sides and under part have a series of indented stripes, similar to the rind of a piece of pork after it has been scored for baking. These stripes were natural, and were not the result of accident. The monster was caught last week outside of Provincetown in Cape Cod harbor, and was killed with harpoons, one of which is still in its side, having been broken off and bent during its struggles to escape."

General Bristow, who is publishing in the *Philadelphia Times* a series of articles upon the annals of war, briefly and tersely recites the military history of General Grant, as follows:—"Before he was 34 years of age Grant had participated in two great wars, captured 500 guns, more than 100,000 prisoners, and 250,000 of small arms, redeemed from rebel rule over 50,000 square miles of territory, re-opened to the commerce of the world the mightiest river on the globe, and stubbornly pursued his path to victory, despite all obstacles. Since then he has crushed out rebellion in the south, re-established the authority of the Union over a territory larger than France, taken 200 battle flags, scores of cannon, thousands upon thousands of prisoners, and hundreds of thousands of small arms, and then modestly returned to the capital of the nation to disband his army of a million men, lay his sword at the feet of the Congress of the people, and wait their pleasure whether he should fill a high station or become an humble private citizen. The world furnishes few such examples of greatness and humility, and our country only one other—that of George Washington."

The *Pull Mall Gazette* states that "the *Golos*, discussing the chances of a war between Russia and China, says that the frontier between the two States, though 10,000 versts in length, is only accessible for military operations at two places. One of these extends from Lake Saissan and the Upper Irtysh to the triangle of Kuldja, while the other is the district of the Amoor and the Ussuri. As to the triangle of Kuldja, the *Golos* believes the Chinese would find an attack upon it so dangerous that they would not attempt it; and so long as the position is in the hands of Russia it will, if held only by a small force, protect the whole frontier line as far as the Irtysh. Moreover, there are now residing on Russian territory in Turkestan several men who, if let loose upon the Chinese, would kindle a flame of insurrection in their newly acquired provinces. Among these are the son of Yakoub Beg, of Kashgar; Hakim Khan, who only last year surprised the town Axa and disturbed the whole country; and Panyachu, the brave leader of the Dzungars. The Amoor and Ussuri frontier, on the other hand, is far more vulnerable. With the exception of a small detachment of Cossacks, there is not a soldier in the whole of Eastern Siberia who could be ordered off for the defence of this frontier. All the local troops are occupied on garrison duty in the towns and prisons nor has any attempt been made to fortify the frontier, as a Chinese attack was deemed out of the question."

The *Times* reports that a daring burglary was committed on the premises of Mr. James N. Routhledge, of English Street, Carlisle, jeweller and silversmith, on the night of Tuesday the 13th of April. "The shop is a prominent one in the principal

business street of the city. The burglars obtained entrance from a lane at the back. They mounted a roof by means of a ladder, pulled it up after them, ascended another roof by the same means, and took off several slates behind a chimney. On getting inside the roof, they scrambled to a trap-door and fastening a rope to a joist swung themselves to the floor of the topmost story in the building. In the shop they seem to have gone leisurely and methodically to work. Both the front windows were examined and cleared. The cases on the counter were ransacked. Six trays of silver watches were carried upstairs to be packed and the trays were left neatly arranged on the floor. Several opera-glasses and two or three gold watches, which had been brought in for repairs, were also taken. Large articles were uniformly avoided. One case containing bright gold ornaments was left untouched. Among the missing articles are the following:—Ten gold lever watches; eight gold Swiss watches; 70 English silver levers; 75 silver Swiss watches; 105 bright and coloured gold Alberts; 30 bright gold guards; 30 coloured gold ladies' Victoria chains; 100 gold neck chains; 250 gold lockets; 30 scarf rings; 50 coins enamelled as brooches, &c.; 250 small trinkets; 40 gold pencils; 70 gold signet rings; 100 ladies' gem rings; 200 gold keeper-rings; 80 wedding rings; 200 gold brooches, some plain and some set with precious stones; 50 pairs of gold chain links; 50 pairs of gold solitaires; 100 sets of gold studs; 20 suites of links, studs, and buttons; about 200 gold breast pins; 60 pairs of gold earrings; 20 gold bracelets; 20 gold pencils; and many other articles. The loss is estimated at very little short of £4,500. It would no doubt have been greater had not the bulk of the gold watches and many of the best gold ornaments been locked away in the safe on the previous night."

STUART ELDRIDGE, M.D.,  
Surgeon-in-Charge.

#### PARIS LETTER.

PARIS, 10th April, 1880.

In point of interest, Nordenskjöld, Prince Napoleon, and Marie Bière, are surpassed by the Comtesse de B—. A few evenings ago she gave one of her famous balls, where all that is distinguished in the aristocratic and fashionable world was present. In receiving her guests, she was aided by her sister. When the Baroness de S—, a lady of Russian origin, arrived, the Comtesse de B— turned her back to her; the sister did the same, and having directed a valet to conduct that lady at once to her carriage, the Comtesse and her sister retired, packed up their trunks, and set off to Brussels with the agility of a defunct financier. The Baroness, when in Russia, escaped strangulation by some masked men, who entered her bedroom: failing in this, they later attempted to set fire to her bed, by placing a slow match beneath it in a shoe. She then came to Paris, where her misfortunes, accomplishments, wealth and connections, opened every *Salon* to her. One afternoon the Comtesse de B. and her sister drove to the studio of M. and Mme. Florence, portrait painters, and discovered they were simply in the presence of the husband of the countess and the beautiful Baroness. *Hine ille torrens.*

Mme. Edmond Adam is a rich widow, not fat, but fair and forty. She is editor and proprietor of the *Nouvelle Revue*, the republican and lively competitor of the Orleanist *Revue des Deux Mondes*, said to have more subscribers than readers. A base late proprietor declined to publish an article on "God," on the plea that it possessed no actuality. Mme. Adam has commenced a series of Wednesday receptions, where music and lit-

enture are the standing dishes, with occasional representations by the leading theatrical artists. One is certain to encounter there every old and new celebrity, save Gambetta, who ever remains conspicuous by his absence, acting it is said on Weller's advice, to "beware of the Vidders." Gambetta avows he is married to the Republic as other people are affianced to the Church, and his chief enjoyment is to pass his holidays in his *bonno retiro* near Versailles with a few bachelors, playing at skittles and nine-pins, with, for change of exercise, a literal carrying out of Candide's advice "to cultivate your garden," and so secure health, ease, and serenity, the three graces of epicurean philosophy.

Mme. Patti and Nicolini must be coining money, as every off night they are engaged in Paul and Virginia extracts from the leading operas; their joint fee is fr. 6,000 an evening, and they generally manage to kill two birds between ten p.m. and one a.m. The *diva* has bought up all the photos representing her between her husband and Nicolini—a trinity not at all desirable. At Baron de Hirsch's *Soirée*, where the Rothschilds are surpassed in sumptuousness by their co-religionist, Patti created a great sensation by singing a ballad from Mignon; the orchestra was composed of the *chefs* of that of the Grand Opera, each of whom is a maestro in his line. The concert room recalled a corner of the gardens of Bagdad, and the artists sang in character. In fact, since Patti and Nicolini warbled in evening costume in the garden scene of *Faust*, at the Princess de Sagan's ball, the incognito could not be repeated. A few extra bank-notes enabled the *diva* to don an Egyptian costume for appearing in the third act of *Aida*. She looked strangely beautiful in the *bistre* tint, which delicately veiled her white features without blackening them. Baron de Hirsch is a Bavarian, and the well-known banker "dear" to Turkey; he owns the hotel formerly rented by the Princess de Metternich, and once the property of the ex-Emperor. Like all Jewish financiers, he loves a title and a decoration, even if it should commemorate the Crusades. This is not in accordance with the democratic spirit of the times, and Israelites are democrats. But, when the nobility become bankers and stock-brokers, the Jews, always having a revenge to take, may be excused for going in for high-dignity honors. A cross is not exactly a decoration for a Jew; the Cabana of Antwerp are more in their rôle, as their cutcheon is "Davids Harp." Rothschild should adopt Nod's ark, and Hirsch, Solomon's Temple. However, vanity, like Guzman, knows no obstacle. The Duchesse Descazes wore a white satin robe, with garlands of natural roses round the skirt, and a bouquet of roses on the right shoulder. Another "sweet dress" was black moire with a long train, an orange scarf, and rivers of diamonds in the hair.

Mme. de Boy was in black velvet; she wore the "Phrygian" coiffure, a fichu of scarlet silk, tied up behind like the Bordeaux country girls, her blond locks retained by a diamond crescent. She is this season the *diva di primo cartello*: no fête in Paris would be considered complete without her: she is the spoiled child of the salons, and being a foreigner, the attention is not homage, but greater patronage. To a style of beauty which commands, she unites suppleness of mind, and a good sounding name: she is tall and robust, with a constitution of steel, as must possess every queen who is at the beck and call of "the world." She is rich too, or what is the same, has unlimited credit, possesses a fine picture gallery, and gives exquisite dinners. She is a Swede, and Sweden rules Paris just now:—there is Nordenskjöld to commence with and Prince Oscar for the finish. She is a blonde, with eyes as profoundly blue as a northern sea. Her beauty is pleasing and juvenile; she is devoid of pretention, charms without appearing to do so, and possesses that supreme attraction—she is natural. She has already dethroned Mme. Bernadaky, whose sculptural beauty struck but never retained you.

How many thorns lie concealed in the roses that strew the path of a Parisian Queen of Beauty, who must expire like all royalties. Curiosity burrows like a mole subterraneously round the sovereign. A thousand stories are current about her fortune, birth, and conduct. Her origin is low, her millions are a blind; she may be a Montpayon; perhaps has killed her children like Medea. She is imitated all the same; hostesses dispute as to who shall possess her, and her red head dress will become a *mode*. The husband of such a beauty is most to be pitied: the world as a rule regards him as an idiot; then he must be ever on the watch lest a wolf should enter the fold; he must be at once the most reserved of lovers, and the most pronounced of husbands: a slip will make him ridiculous, and ridicule kills.

The Duchess of Newcastle is now Mrs. Tom Howler. She is daughter of the celebrated banker Hopes and after eighteen years of a miserable union with a worthless duke, casts off her weeds, and weds her husband's private secretary. But Tom Howler is a splendid looking fellow and of very elegant manners. He has a good tenor voice, and attempted the stage; but failing to become a Mario de Candia, has succeeded in being the husband of a duchess. It is refreshing in this prosaic age to see queens marrying shepherds, and love treating parchment scrolls as so much waste paper. The

duchess is very popular in French society, and her mansion, in the rue de Miromenil, is furnished with great taste.

Another illustrious recruit to the fashionable world is the Prince of Wales, who needlessly sacrificed his popularity, by an undignified sympathy with that now *dodo* dynasty—Bonapartism. He will cut out the Prince Oscar, who has a good deal of the hobbledy-hoy in him, and who made a laughable blunder in coming to the Princess de Sagan's ball with a transparency under his dress-shirt. Viscountess de Corval is to give a fancy ball in honor of the Prince of Wales, where all the gentlemen are to appear in scarlet. The prince will sign the marriage contract of the Marchioness de Galliffet's daughter—aged 18—fortuneless and devoid of the radiating beauty of her mother, our first of fashionables. Her intended husband is double her age, a millionaire, and brother of the Princess de Sagan. This lady and the Marchioness de Galliffet, represent the Anglo-mania clement in French Society; they adopt, "ye manners and ye customs" of England; keep only English servants, read only English literature; and, unable to have their children born on the banks of the Thames, have them, as a compensation, baptized with English names.

Nordenskjöld must be as glad to escape the ovations given to him by the French, as he was to get clear of the last band of ice that barred him out of the sweet waters of Asia. *L'Homme de Glace* ate his last dinner with the author of *L'Homme qui Rit*; and Hugo, over the walnuts and wine, complimented him on having opened an additional road for the universal republic: Stanley received the same incense for his voyage across the dark continent, and doubtless if de Tracy can reach the South Pole, the old man eloquent will eulogize him similarly.

The public is becoming oblivious of the Jesuits, whose notice to quit will expire by August. Emile de Girardin says that there are 3,000 in France, not 1,480 as given by the official Cocker. It is better to agree with Figaro and Garibaldi, and admit that they are "here, there, and everywhere." They and the other religious orders must submit to the law or take up their beds and walk. Prince Napoleon has been indulging in some political fireworks. He claims to be democratic and anti-clerical, asserts the Republic is right in dispersing the Jesuits, &c., and takes French leave of his quondam allies, the royalists. All the effect this manifesto has produced is to give Paul de Cassagnac fits, and necessitate his keeping the black border on his journal the *Proys*, till the empire finds an emperor, and since it is an elective institution. Why not propose himself? Prince Napoleon has only written one letter more; for France he remains the same; he represents a dynasty that reposes on no principle, no authority. Bonapartism has never been more than an adventure, which speculated on the country with a historical label that cost dear, collapsed like a circus when abandoned by success; it is not now even *debris*, it is dust.

Mlle. Auelore, the leader of the movement against "masculine autocracy," refuses to pay her taxes, till she be accorded the right to control their expenditure, by voting for a representative. French gallantry unhappily will take the form of a baliff. During the expiring days of the Second Empire, one gambon played at Hampden, and every year the authorities had to seize his cow for taxes:—but he bought the milker in.

On one occasion Bernadotte, King of Sweden, was very ill; he refused to be bled, till the doctor promised not to mention the appearance of his arm. "Death to Kings," was tattooed thereon, a device of Bernadotte's, when a simple soldier of the Republic.

"Garcen, this turbot is not so good as you served me this day week." "I can assure you, monsieur, it is the same fish."

A man, half seas over, on stepping into some pools of water, complained that they were his shoes which drank, but it was himself who was drunk.

Since the queen of Spain promises an heir to the throne, the princess of the Asturias, heiress presumptive, mourns so inconveniently the hopes that leave her, that simple expulsion is on the cards for auntie *in pique*.

Siberia, according to a French traveller, is the most intellectual region of Russia:—the educated classes are all transported there.

Alphonse Daudet's brother having published "Souvenirs of Macmahon's Presidency," some wags sent two alienists by appointment to visit the author.

Sarah Bernhardt is at last baptised:—her portrait figures on cigar boxes and squares of soap.

A lady is now calling on theatrical managers with two cwt. of manuscript plays; and invites them to make a selection.

#### JAPANESE NEWS.

[The following Notes on various Japanese matters are chiefly derived from the native papers, occasionally supplemented from original sources of information, and are carefully collated and edited, so as to make them readable and intelligible.]

#### COURT, POLITICAL AND OFFICIAL.

His Excellency Sano, Minister of Finance, accompanied by several subordinate officers of the department, inspected the Yokohama Custom House on the 27th ultimo. They returned to Tokio the same evening.

His Excellency Yanagiwara, Envoy Extraordinary and Minister Plenipotentiary to the Court of St. Petersburg, and His Excellency General Ida, Envoy Extraordinary and Minister Plenipotentiary to the Court of Vienna, left for Europe on the 28th ultimo, in the French mail steamer *Volga*.

Mr. Chida, Governor of Hiroshima, and Mr. Tada, Chief Secretary of Okayama, arrived in Tokio on Friday last, the 28th ultimo.

A musical entertainment took place in the Aoyama palace on the 27th ultimo, in the presence of Their Majesties the Empress and Empress Dowager.

Mr. Iwamura, Governor of Kagoshima, accompanied by several of his subordinate officers, has arrived in Tokio to report to the authorities respecting the land-tax and industries of his prefecture.

His Excellency Sugi, Assistant Minister of the Imperial Household, is shortly going to visit the Northern provinces on official business.

The local assembly of Kanagawa Ken is to meet for the despatch of business on the 8th instant.

To inaugurate the approaching visit of His Majesty the Emperor to the provinces, an official banquet is to be given on the 13th instant, in the palace, to the Imperial Princes, the Prime Ministers, the Privy Councillors, and the Choku-nin officers of the different Departments.

His Imperial Highness Kita-Shirakawa, Chief Commissioner for the Second National Exhibition, and the other members of the Commission, will hold a preliminary meeting on the 2nd instant.

The Kencho, the police stations, and schools in the prefecture of Okinawa (*Loochoo*), are to be built in the European style at an estimated cost of 74,000 yen.

The Austro-Hungarian Minister was received in private audience by His Majesty the Emperor, on the 31st ultimo.

It is currently reported that Mr. Shiota, a 3rd class official of the Foreign Department, is to be appointed Envoy Extraordinary and Minister Plenipotentiary to France in place of His Excellency Sameshima.

Mr. Nabeshima, Governor of Okinawa Ken (*Loochoo*), who lately arrived in Tokio on official business, returned to his prefecture Wednesday last, in the *Hiroshima Maru*.

The Superintendent of the Central Board of Health left Tokio on the 2nd instant, for Osaka, Hiogo, and Nagasaki.

A meeting of the local sanitary board is to be held in Osaka to consider what precautionary measures are to be taken to guard against cholera.

Their Excellencies Matsukata, Minister for Home Affairs, and Komo, Minister for Education, will leave the capital on the 8th instant in advance of His Majesty, and await the imperial procession at the post town of Kameyama.

His Excellency Yoshii, Vice Assistant Minister for Public Works, who has been in Kiushiu on an official tour of inspection, returned to Tokio on the 31st ultimo.

Mr. Funakoshi, the new Governor of Chiba Ken, returned to his prefecture on the 1st instant.

Mr. Nabeshima, Governor of Okinawa Ken (*Loochoo*) returned to his post on the 2nd instant.

The local assembly of Sakai met on the 1st instant.

Messrs. Murata and Yamawaki, Secretaries of the Daijo Kwan, have been ordered to Germany.

His Excellency Terashima, *Sangi*, will shortly give a soirée at his private residence at Shiokane, to which many prominent gentlemen both in public and private life will be invited.

Almost all the Government Departments found a deficiency in the appropriations for last year, but the Department of Education had an excess of more than one thousand yen.

Tokugawa Keiki, the ex-Shōgun, has sent Mr. Hayashi, a shizoku of Shizuoka ken, as his representative to return thanks to His Majesty the Emperor, for his recent social promotion.

His Majesty the Emperor will visit His Excellency Terashima, *Sangi*, on the 9th instant. Their Majesties the Empress and Empress-Dowager will also call upon His Excellency during the afternoon of the same day.

His Majesty the Emperor entertained the Prime Ministers and the Privy Councillors at a banquet in the European style, in one of the buildings in the Fukiago Park, on the 4th instant.

The following officials will accompany the Emperor in his

visit to the provinces:—Their Excellencies Sanjo, Prime Minister; Terashima, Ito, and General Yamada, Privy Councillors; Tokudaiji, Minister, and Hijikata, Vice Assistant Minister for the Imperial Household; Matsukata, Minister for Home Affairs; Kano, Minister for Education; besides about four hundred subordinate officers.

Mr. Yamaoka, Chief Secretary for the Imperial Household, who left the capital with his staff in the middle of last month in advance of His Majesty, is now at Aichi, and will start from there for Kioto and Kobe about the 7th instant, and then return again to Kioto where he will await the arrival of the Imperial procession.

It has been officially announced that from the 4th instant the Daijo Kwan will be opened at 8 a.m. every day, Sundays excepted, for the transaction of business, and closed at 2 p.m.

The office hours of the Home and Finance Departments are to be similar to those of the Daijo Kwan.

The Governor of Tokineki Fu, Corea, has communicated with the Japanese Authorities at Fusan respecting the despatch of a Korean Ambassador to Japan. It is said that the Ambassador will leave Fusan at the beginning of this month, and the traders in that port will entertain him at a farewell banquet prior to his departure. The Ambassador will call at Shimonoseki, and Kobe, and then proceed overland to Tokio along the Tokaido. It is expected that he will remain in the capital for four months, and visit Nikko and other places of interest during his stay in Japan.

The *Nichi Nichi Shimbun* states that Her Majesty the Empress is a great adept in the art of fancy needlework, and has lately embroidered two robes for the young Prince Harunomiya. Her Majesty also intends to embroider a robe for the Emperor. Our contemporary mentions that Her Majesty is greatly interested in historical works relating to the ancient days of Japan, and studies them continually.

It is rumoured that the new civil code which is now in course of publication, will be translated into English and French for the use of foreigners.

The *Choya Shimbun* says that in order to be prepared for the cases of cholera which may be expected during the hot weather, a quantity of carbolic acid has been distributed by the Tokio Fucho among the different ward authorities.

#### NAVAL AND MILITARY.

During the absence of the *Tsukuba Kan* on the cruise to North America, the *Kinjo Kan* will be used as a training ship.

There will be a rifle competition in the grounds of the Toyama Gakko (Military College), on the 13th of next month. Foreigners will be allowed to compete as well as Japanese.

Lieutenant-Colonel Katsura and several other officers, received the insignia of the Order of the Rising Sun on the 29th ultimo.

The eight military cadets who successfully passed the recent examination in the Kiododan have been appointed sergeants.

Dr. Hayashi, Surgeon-in-Chief of the army, has been ordered to inspect the Osaka, Hiroshima, and Kumamoto garrisons.

A native paper says that:—"At Shimizu on the 27th ultimo, the crew of the *Kongo Kan* were manoeuvred in a night attack and defence of the port. One portion of the crew was landed to represent the defenders, and at 9 o'clock at night the mimic warfare commenced with a furious cannonade from the ship on the town. This was quickly responded to by the party on shore, who repelled an attempted landing from the boats. The big guns thundered and the sharp rattle of small arms was kept up, until daylight when the invaders being defeated and having retreated to their vessel, the struggle terminated."

The Staff Office has published a history of the different wars engaged in by Japan from the time of Jimmu Tenno.

On the 31st ultimo one regiment of the Imperial Guard was reviewed at Asukayama, and another at Ezaki.

His Majesty the Emperor will, before setting out on his visit to the provinces, witness a review of the Imperial-Guard in the Fukiago park.

The *Kongo Kan* returned from Suruga on the evening of the 31st ultimo.

Port Admiral Hayashi visited the Russian man-of-war *Djigit*, on Wednesday last.

The commanding officers in the Japanese army held a meeting on the 1st instant, in the War Department.

#### INDUSTRIES, TRADE AND FINANCE.

The *Chogyu Shinbun* says that "a report is current to the effect that a German, Mr. —, employed by a certain Department at a high salary, has sent in a long memorial on the state of financial matters, and affirms that in order to rescue the finances of this country from their present difficulties, there is no other course open than the raising of a fresh foreign loan, so as to provide funds for the withdrawal of the paper money now in circulation. We cannot, however, ascertain any foundation for this statement."

An enormous quantities of coal are found in the districts of Kiyase and Hikayama, in the province of Chikuzen, a railway about eight ri in length is to be built between Kiyase and Hadatsukasa, in the province of Buzen. It is estimated that the new line will cost much less than the Kobe-Ootsu extension, and that it will tend to greatly develop the coal-mines of the district. The work is to be commenced on the 15th of this month, the Government granting a subsidy.

The 1st National Bank, the Mitsui Bussan Kaisha, and Okura & Co., are going to establish branches at the port of Fusan, Corea. The Tokio Marine Insurance Company intends to establish branches at Gensan, and also on Miyako-jima, one of the Loochoo islands situated very near to Formosa. The branch of the Marine Insurance Company at Gensan will be under the supervision of the Mitsui Bishi Company, and that at Miyako-jima, under the direction of Mr. Mase Hambei.—*Nichi Nichi Shinbun*.

The *Kumamoto Maru* brought thirty thousand bags of rice to the capital from the northern provinces on the 27th ultimo, and eleven junks brought twenty-seven thousand bags of the same cargo from the provinces of Mikawa, Ise, Owari, &c.

The following is the return of exports and imports at all the open ports of Japan for the month of April last:—

Imports .....	Yen 3,433,855.39
Exports .....	" 1,188,000.06

Excess of Imports .....	Yen 2,245,855.33
Export and Import duties and miscellaneous receipts .....	Yen 204,320.95

The Noshiro mines in the province of Echigo were thought to contain large quantities of copper, but when they were lately properly tested it was found that the ore contained only one-fifth copper, the remainder being sulphur.

A new road is to be constructed across Sekiyamagoye, between the prefectures of Yamagata and Miyagi, at an estimated cost of 80,000 yen.

The mint is now very busily engaged carrying out orders from persons in China for silver coins, and instructions have also been received from the Finance Department for the coinage of 300,000 silver yen before the approaching summer vacation. The Mint authorities have therefore increased the number of employees, and carry on work with great rapidity. The coinage of the 700,000 yen ordered from China, will be completed before the 20th instant.

The Yokohama native Chamber of Commerce held its usual meeting in the Town Hall, on the 4th instant.

It is said that the tempo will be withdrawn from circulation in the month of October next.

The *Akitama Maru* on her first trip to Gensan, Corea, arrived at Fusan about 1 p.m. on the 17th ultimo. The vessel had on board, Consul General Maida, between two and three hundred passengers, and a very large cargo. In consequence, she was unable to take any more passengers in at Fusan, and left there in company with the man-of-war *Awaki Kan*, at 6 p.m. on the 18th, for Gensan. These traders of Fusan who had been long waiting for the opening of Gensan, were greatly disappointed when they found the Tokio merchants got there before them through there being no room in the steamer. The *Kanko Maru* arrived at Fusan at 1 p.m. on the 24th ultimo, carrying, as usual, a large number of passengers.

The Tokio Rice Exchanges will be permitted to recommence operations after about the middle of the month when the new regulations will be completed.

A native paper says that the Osaka mint authorities have lately procured samples of the money in circulation in different

foreign countries, and will send in exchange eight of each of the coins used in Japan.

#### MISCELLANEOUS.

From a report lately published by authority we learn, that the population of Japan at present numbers 34,338,404 people; of whom 17,419,785 are males, and 16,918,619 females. This shows an increase of 340,955 over the census of 1875.

A native journal states that there are thirty-six islands in the vicinity of Japan whose circumference is over one ri. They are divided as follows:—

Above	1 ri and under	10 ri	One
10	"	20	" Fourteen
20	"	30	" Five
30	"	40	" Six
40	"	50	" One
50	"	70	" Two
70	"	100	" One
100	"		Six

The reported death of Mr. Mutsu in the prison of Miyagi Ken, has been contradicted in the *Nichi Nichi Shinbun*.

A telegraph line, now in course of erection between the towns of Kofu and Nagoya, will be completed about the 15th instant. The distance between Fusan and Gensan, Corea, is one hundred and twenty-five ri by sea, and one hundred and twelve ri by land.

It is now under consideration to open the Kioto-Ootsu railway line, which is almost completed, on the 15th of July next, in the presence of His Majesty the Emperor.

Mr. Orushima, one of the writers on the staff of the *Hokushin Zasshi* having published two articles in that periodical, one on the Meeting Regulations, and the other under the title of "Powerful at Home, and Powerless Abroad," both violent attacks upon the Government and therefore infractions of the Press Laws, has been condemned to thirteen months imprisonment. Mr. Kashima, the publisher of the periodical, has been sentenced to twelve months imprisonment as an accessory.

The *Nichi Nichi Shinbun* states that Shakagatake, in the Oumineyama range, has burst into active eruption. At the end of April, the mountain commenced to send forth quantities of smoke, which gradually increased, and at the present time a large crater has been formed. There was an earthquake in the province of Iki on the 23rd of May, which destroyed a great number of houses, and caused the death of many people and cattle.

Cases of cholera are reported to have occurred on the 30th ultimo at Suwacho, Asakusa, Tokio, and the village of Nami-tachi, in the prefecture of Kumamoto. A case resembling cholera is also reported from the village of Furukata, in Kumamoto.

The construction of the street tramway in Tokio, projected by Mr. Taneda Seichi, is shortly to be commenced. It is expected that the work will be completed before the opening of the second National Industrial Exhibition next year.

It is reported that the Tokio-Takasaki railway will be extended to Maibashi via Iseaki.

The railway line now in course of construction at the Kamaishi mines, in the province of Iikuzen, will be completed about the month of July next.

There was a fatal case of cholera in the village of Fukiage, in the prefecture of Saitama, on the 30th ultimo.

Nakamura Rokuza, Furusho Kamon, and Kimura Tsuruo, all Kumamoto men, and Murao Keisake, a Hiroshima man, who have long been kept in prison on suspicion of being concerned in the assassination of the late Hirotsawa, *Sanyu*, have been declared innocent upon that charge, but guilty of the murder of the late Sawada Emori, a *shizoku* of the former Kochi Han. Nakamura, as the principal offender, was sentenced to be imprisoned for ten years by the Daijishin-in, on the 2nd instant, while the others were released on various grounds, and from the fact of their being so long in custody.

A native journal states that during the past month twenty-seven foreign ships arrived in Yokohama with 141 foreign, 2,329 Chinese, and 195 Japanese passengers. Thirty-four foreign ships left, one hundred and twenty Japanese ships arrived, and one hundred and nineteen left.

Kofu and Nagoya, Tsu and Otsu, the towns lying in the route of the forthcoming Imperial progress, are to be connected

by the telegraph, which will be opened for communication about the 12th instant.

The extension of the gas mains from the Yorozyo-bashi (Megane-bashi) to the premises of the Museum in the public gardens of Uyeno, was commenced on the 3rd instant.

#### IMPERIAL GOVERNMENT RAILWAYS.

7.—THE HALF-BRED HANDICAP.—Value \$150. One Mile. Entrance, \$5.

Kicho, Kioso, Tekiro, Sirkesse, Admiral Rous, Warwick, Hokuse, Bon René, Asagawa, Hahen.

#### ARRIVAL OF THE FRENCH MAIL.

Rangoon, 19th April.—Theebaw is still alive. The rumour of his death was caused by the palaces being closed until recently. A great panic prevails at Mandalay, where the sacrifices are firmly believed in.

Rangoon, 22nd April.—There is no reliable Mandalay news, except that it seems Theebaw is alive. Human sacrifices are denied, but many people are said to be missing, and the panic is general at Mandalay. The Burmese Government ascribe it to four drunkards having seized some people and committed robbery. They were ordered to be publicly beaten round the city. It is thought here that such a panic could hardly be caused by four drunkards, and that the stoppage of trade would not have ensued without reasonable cause.

Bombay, 22nd April.—At the Police Court this morning Mr. Briated, the chemist's assistant who made up the prescription for M. Grondona, was charged on remand under the penal section with causing death by a rash and negligent act. The Magistrate said the Superintendent of Police, had informed him that the Government, after consulting its law officers, purposed offering no evidence, and therefore the prisoner would be discharged.

Colonel Austin, of Dave Carson's troupe, who arrived this morning, attempted to commit suicide in the presence of his wife this afternoon by cutting his throat with a razor. He inflicted a deep wound, injuring the jugular vein. He is in a precarious condition.

Ghuzni, through Cabul, 24th April.—Our European dead in the action on the 19th were buried on the ground by Chaplain Warnford after the enemy retreated. The tribes engaged in the action were from the country south of Ghuzni; none of the Ghuzni tribes joined, they preferring to await the result of the engagement, which has had the effect of quashing any plan that might have been made for defending this place.

The surrounding Mullicks from Wardak and elsewhere have now made submission.

Mahomed Jan's brother and many other Sirdars are coming in from the Mustaffi's fort. Mahomed Jan himself had fled to Zurnut. Musa Khan with Mushk-i Alam is at the latter's own fort. Mushk-i Alam is reported to have done all he could to encourage the late tribal gatherings. Our troops are in capital health and spirits, though they experienced much difficulty in getting supplies owing to the desertion of the villages along the line in obedience to orders from hostile leaders, who for twenty days marched their force parallel to our right flank dominating the tribesmen. The Hazaras, too, though friendly, were productive of much inconvenience. They burned all deserted villages and consumed supplies that otherwise would have come to us. Ghuzni itself is in a wretched condition, the walls being in absolute disrepair. They could not stand for one hour against modern artillery. The troops halt here two days and then proceed to Sheikhabad, from which place the majority of the division will probably be sent on to Kushi and Kurram. The weather is splendid.

Allahabad, 26th April.—Messengers from Abdul Rahman to his friends in Cabul have arrived. Their statements shew that the Sirdar is not as strong in Turkestan as was supposed. He has little money, and his troops are

still in arrears of pay though given rations. He is still at Kundami trying to organize a force.

The stories, circumstantial though they were, of Abdul Rahman's visiting Ghori, Kinjan and Indarab, appear from recent accounts to have been false, as no mention is made of his having left the direct line between Mazar-i-Sharif and Faizabad.

It is reported that Musa Jan after the fall of Ghuzni was taken away by Mushk-i Alam to Shahpur. His tutor, Mahomed Yussuf, was wounded in the fight. Yussuf's brother was killed.

The news of the capture of Ghuzni is not yet fully believed in Kohistan and Cabul.

From reports received to-day there is no doubt that in several places in Kohistan collections of armed men are watching with anxiety the proceedings of their deputation in Cabul. Mir Butcha has promised to come in to-morrow or Monday.

A rumour of armed bands being within 10 miles of Shopor to-day was proved to be groundless by a reconnaissance made by Kennedy and Dagg; all was found quiet beyond Paenminar Kotul.

London, 27th April.—A difficulty has been experienced in forming the new Ministry, as the Radicals claimed to be re-elected. Lord Derby, Mr. Goschen, and Lord Rosebery, declined seats in the Cabinet.

St. Petersburg, 27th April.—It is reported that the author of the Winter Palace explosion has been arrested.

London, 28th April.—Mr. W. P. Adam has been appointed Chief Commissioner of Works.

Aden, 28th April.—The *Mongolia* with the mails of the 16th inst., left here for Bombay at seven this morning.

London, 29th April.—Mr. J. G. Dodson has been appointed President of the Local Government Board, with a seat in the Cabinet. Mr. Chamberlain is President of the Board of Trade. Mr. Mundella is Vice-President of the Committee of Council on Education. Sir Henry James is appointed Attorney-General. The Marquis of Lansdowne is Under Secretary for India, and Earl Morley Under Secretary for War. Lord Carlingford has been appointed Ambassador at Constantinople.

London, 30th April.—Lord Carlingford has declined the appointment of Ambassador at Constantinople, Mr. F. Herschell is appointed Solicitor-General, and Mr. H. Campbell-Bannerman Financial Secretary at the War Office.

Obituary.—Lieutenant-General Percy Hill.

The Emperors of Germany and Austria have sent generals to congratulate the Czar on the anniversary of his birthday, which is considered as a renewal of cordial relations between Russia and the other two Empires.

Parliament assembled yesterday, when the new members were sworn in and Mr. Brand elected Speaker. Silver 52½.

London, 1st May.—Lord O'Hagan is Lord Chancellor of Ireland. Mr. Osborne Morgan has been selected as Judge Advocate-General.

London, 3rd May.—*The Times*, in a leading article, announces that a grave error has been discovered in the estimates of the expenses of the Afghan war, exceeding three million pounds.

Mr. Herbert Gladstone, in a speech to-day at Leeds, stated that he believed the deficit in the Indian Budget is from four to five millions.

Lord Rippon starts for India probably on May 15th.

An association is forming to obtain the abolition of the duty on silver plate, in the interest of the rupee.

The *Borchgrevink* with the Princes on board has returned to England.

Rome, 2nd May.—Owing to the defeat of Signor Cairoli, a royal decree has been issued closing the Chamber and fixing new elections for the 16th.

London, 3rd May.—Major-General Sir J. M. Adze has been appointed Surveyor-General of Ordnance.

Upon the motion of the Government, a Select Committee has been appointed to inquire whether Mr. Bradlaugh can dispense with the oath of allegiance. Consols closed at 99½.

London, 5th May.—The *Daily News* publishes a paragraph, stating that Sir Garnet Wolseley is most probably to succeed Sir Frederick Haines.

The *Standard* urges the immediate recall of Sir J. Strachey.

The troopship *Malabar* is preparing for sea to convey Lord Ripon to India.

The *Daily Telegraph* publishes a paragraph stating that Gordon Pasha has been appointed Private Secretary to the new Viceroy.

Mr. Lowe is to be raised to the peerage.

London, 6th May.—The order for the preparation of the troopship *Malabar* to convey Lord Ripon to India has been countermanded, and his Lordship will proceed in the P. and O. steamer *Ancona*.

## THE JAPANESE PRESS.

### A CURRENT RUMOUR.

(Translated from the *Choya Shimbun*.)

A RUMOUR is now current among the public that the Government is about to revise the press laws, so as to make them more severe and repressive. We know not whether such really is the intention of the authorities, but as, when one dog barks at a shadow, thousands of other dogs commence to bark also, trusting in the first one, even so those who would not have initiated the current rumour, now find their minds with some suspicion on the subject; therefore, regardless of any ridicule which may attach to us for our too ready credence in such a report, we will now comment upon it, treating it as accurate.

In the first place, we must examine the reason why our Government considers the existing press laws imperfect and wishes to make them more strict. Secondly, when we ascertain this we must then inquire how does the Government expect to accomplish its end. In our opinion, the Government, considering the political agitators who have appeared in different parts of the interior injurious to the safety of the community, just as weeds are prejudicial to a plant, may have come to the conclusion that the people, being still in a state of political infancy and utter ignorance, were unable to see the difference between good and bad measures of administration, and just and unjust laws. It would then follow that it is the fault of the newspapers that those childlike and simple people have now become enlightened and induced to direct their attention towards the condition of the administration and the laws, and to plunge their beaks into the acts of the Government. Therefore, in order to suppress the politicians in the different localities, and protect the peace of the country by cutting down the evil results which might be expected before they had out, the authorities consider it necessary to bring the newspapers further within the power of the Government, and, in order to make the influential papers powerless and submissive, so as to be unable to oppose the authorities, it is absolutely necessary to make the press laws very strict. Now we will ask our readers may not this be the case?

Well, the fence of seclusion which surrounds the Government is impervious to us, the people. Therefore taking our supposition as correct, we shall proceed to examine whether or not the Government can by such a process accomplish its end.

Now, listen to the words of some well-educated men! One says that the present is a very anxious moment, and therefore every body must act cautiously; while another says that the Government must turn the needle of its policy in another direction at once, otherwise it is impossible to foretell what change will take place among the people. Thus, we find that, with the exception of some ignorant flatterers, no one pretends that the present state of our community is safe and peaceful. Therefore we say it is a duty incumbent upon the Government, which is responsible for the tranquillity of the country, to direct its careful attention to all affairs, so as to remove the causes of evil before they culminate in disaster. It is owing, however, to the events of some years past that the people in the different districts have now become very eager to possess political rights, and they sometimes commit acts of violence, and thus embarrass the Government. Is there any reason why the people, who have been crushed to the earth for several hundred years under an oppressive Government, have now suddenly lifted up their heads and commenced to argue and discuss respecting political subjects? One cause for this is owing to the fact that the Govern-

ment, being desirous of rivalling the different countries of Europe and America, has acted with great energy and thus improved and enlightened the minds of the people; while another is that the newspapers, by always advocating liberal views, have stirred up the people to a sense of their rights. However, it being the natural tendency of all things that an advantage is always followed by a disadvantage, though the green buds have fortunately come out of the earth without any interruption, through the hard and laborious work of both the Government and the journalists, yet the weeds have sprung up at the same time, although neither the Government nor the papers expected any such result. Now the Government has only looked at the evil effect produced on a small part of the people, and, forgetting the interests of the vast majority, has suddenly veered round in its policy, and putting blame upon the newspapers that have taken part with it in planting the seeds, now wants to compel their submission with the idea that by so doing all evil consequences will be averted. How can the Government succeed in its object in this way? Granting that the politicians in the interior might at first have been enlightened and incited by the newspapers; at present they walk alone, and are quite independent. It is quite obvious to anyone, that the journals are now powerless to control the public. Now we shall give an example of a plant and a weed. It is the business of a farmer to cultivate the land, and to plant seeds, but when the young green rice springs out of the earth, some weeds may be produced among it at the same time. Then, if we blame the farmer for producing weeds in the rice fields, he is highly annoyed and troubled. In what respect does this differ from the Government taking notice of the conduct of some bad young men who have appeared in the interior, and blaming the newspapers for their evil proceedings? We notice that the more the papers become restricted, the more the politicians become excited, but we are unable to find out any reason why the Government should be afraid of the movements of the evil-disposed young men, and therefore oppress the journals.

If the Government really desires to secure the tranquillity of the country, it would act more judiciously by complying with the wishes of the well-disposed classes and thus becoming in accord with them. This course would at once open the door for the promotion of the welfare of both the Government and the people, and thus prevent evil results before they arise, and it would not be a wise plan for the authorities to pursue any policy of maladministration in consequence of some anti-Government party existing in the country, which would create bad feeling between the rulers and the governed. The Government is like an experienced farmer, and knows perfectly well how to nurture a plant, and therefore it would not act in such a manner as to blame the gardener for the appearance of a few weeds, and thus at last turn the well cultivated field into waste land. If the rumour we have mentioned is quite unfounded, it is very fortunate both for us and for the community, and then we shall reproach ourselves for our hasty comments upon the subject.

## ON POLITICAL RIGHTS.

(Translated from the *Akebono Shimbun*.)

THE question of the distribution of political rights in our country is not a matter of yesterday, but originated with the commencement of the first year of the Restoration. Why do we say so? Because if the old notion that political privileges should always be retained in the hands of the mightiest had been allowed to prevail, it would not have been possible for worthy and able men, of the different clans, who did not belong to any well-known family nor held any high position, to sit in the Government, and be the ruling spirits of this Empire. It was for the most part owing to the labours of members of the Satsuma and Choshu clans that the Bakufu Government was destroyed, and that an expedition was fitted out against the different princes in the north-east, which successively brought them all to submission. Hence, just as Yoritomo overthrew the House of Taira, or Hojo destroyed the power of Minamoto, or Takanji established the Shogunate

which Ota, Toyotomi, and Tokugawa in turn took possession of, the princes of Satsuma and Choshu might respectively have become *Tai-Shogun* (Commander-in-Chief) and *Fuku-Shogun* (Vice Commander-in-Chief). Then, each having secured his share of the administrative power neither would ever have given way to the other, and the members of both clans would have been in constant rivalry, and affairs would have been as they were between Yamana and Hosokawa in their relations with Ashikaga. However, after peace was restored in the north-east, the modern leaders immediately returned to their respective provinces, and the authority of the Government was handed over to worthy and capable men selected from the whole country. Shortly afterwards the *Han* (clan rulers) were abolished and *Ken* (prefectures) were founded; and even the princes of Satsuma and Choshu were placed in the same rank as other nobles. These results were brought about by the exigencies of the time, the march of which even a mighty and well trained army would be unable to prevent. If one powerful man is unable to carry on the government alone, he has to share it with other people; and thus it happens that we are correct in saying that the fair distribution of political rights was founded in the beginning of 1868.

How was it then that the revolution in the year 1868, occurring in a feudal period, brought forth such vast results as had never been seen before? Perhaps the purpose of the Imperial House was to confer upon deserving princes a share in the administration; but the reason why, on the occasion of the great change, intelligent and active men from the different parts of the country were caused to sit in the Government, and take the actual rule into their own hands, was because the Bakufu had ruined itself, and made the whole population weary of living under its jurisdiction. It thus excited the best men of the nation, and enabled them to accomplish their end. We may add that it was, indeed, the result of natural consequence that the Emperor took the oath which contains five articles:—His Majesty promised that "he would act in conformity with universal principles of justice," and that "he would not make his subjects weary of his rule." Thus, as we have said, prompt and energetic measures were at once taken to satisfy the minds of the people. Administrative power was retained in the hands of those who had become possessed of it; and the princes of Satsuma and Choshu were placed in the same position as that held by any other nobles. In spite of all this, however, the division of political rights is confined to the members of the Satsuma and Choshu clans only, and is not made among the public of the Empire; because the cabinet is now composed of the members of the said two clans. So it is generally with the local Governments in different *Fu* and *Ken*, (the Tosa clan having already lost its influence, and the Iizen sept only following the lead of Satsuma and Choshu). How is it, then, that, though equal partition of privilege originated in the beginning of the year 1868, yet its consolidation in the hands of only a few functionaries has been more and more confirmed in the interval of thirteen years? The reason why princes, famous for great deeds, were not allowed to alone assume administrative power was the recognition of the principle that that power ought to be shared with others, and that political right should be one of the possessions of the people. The capable men of Satsuma and Choshu did not allow even their own gallant princes to take the reins of Government; but abolished *Han* and established *Ken*, thus securing for themselves the control of the affairs of the whole country. As regards politics they have done as they pleased, and in this way they have long independently exercised authority which they never wished to share with other people. This being so, does such a state of things differ from that which would have obtained if a Satsuma and Choshu Government had been established in place of the Bakufu? If the present were similar to the olden time, when anyone who defeated a ruler set up his own authority in his place, it would then be proper that the men of Satsuma and Choshu should take sole charge of the administration, or make their own princes respectively *Shogun* and *Fuku-Shogun*. Notwithstanding the fact that the principal of partition of political rights was recognized in the commencement of 1868, the two clans referred to have alone for a long time retained the administrative power for themselves.

Can we then hope to see the actual application of "con-

formity with the principles of universal justice," or "the people contented," as announced in the Imperial edict? According to the Emperor's promise "to act according to the principles of universal justice," political power should be shared with the people, and public affairs ought all to be administered in compliance with public opinion. We cannot say that to allow the Satsuma and the Choshu men alone to have the exercise of political rights without submitting it to the people is "in accordance with the general principles" spoken of. If the Emperor wishes to please the people, he has to yield to their will and not to oppose it. Now, our compatriots all desire to have a constitution granted, and a National Assembly established, so that they themselves may have a share in legislation; therefore, if the Emperor desires to please them, he will comply with their wish and take measures for the production of the required end. However, though they have forwarded memorials and petitions one after another to the Government, the authorities have taken no notice of them. How, then, do they please the people? Under these circumstances, if any one says that the Satsuma and the Choshu men heartily yearn for the pleasures of power, and are careless about acting contrary to the will of the Emperor, we cannot combat his opinion. Ah! it was a welcome opportunity for the Satsuma and Choshu men when the Bakufu Government ruined itself in the opinion of the inhabitants of the Empire. They possessed themselves of the authority wielded by the party they had destroyed, and the change was sufficiently pleasing to the people of both clans. If the energetic personages now in charge of the Government care nothing about the public of the country, we cannot approve their behaviour.

#### LAW REPORTS.

##### IN H. B. M.'s COURT FOR JAPAN.

Before R. T. RENNIE, Esq., Judge.

SAMUEL COCKING v. D. MORGAN, Master, British Steamer *Flintshire*.

Tuesday, the 1st day of June, 1880.

This was a claim for \$95.90, the value of two casks of chloride of tin. The further hearing of the case was postponed on the 27th of May ulto. to allow of the parties adducing further evidence.

Mr. Litchfield again appeared for the plaintiff and Mr. D'Iffanger, of Messrs. Adamson, Bell & Co., the ship's agents, represented the defendant.

In reply to the Court, Mr. Litchfield stated that he did not intend to call any further evidence and the plaintiff's case was closed.

Mr. D'Iffanger then called

Edward Divers, who being sworn, said:—I am a British subject residing in Tokio. I am a doctor of medicine. I am well acquainted with the compound known as chloride of tin. It is apt to deliquesce from contact with the atmosphere. I should think that the hot air of the hold of a vessel in the Red Sea would be sufficient to deliquesce it. If it was properly packed in a wooden vessel it would be very slowly affected. It is also liable to melt from heat. The hot air in the hold of a ship in the Red Sea would be sufficient to cause chloride of tin to melt without getting at it. If the chloride of tin was melted by heat it would rot wood slowly. The piece of a stave shown me (exhibit D.) looks as if it had been rotted by the action of melted chloride of tin. It presents a similar appearance. It is difficult to find any other packages for chloride of tin than wooden vessels. It should be packed in very strong air-tight casks. Even if so packed and melted by the heat of the hold or liquified in any way, it would rot the wood with which it came in contact.

Cross-examined by Mr. Litchfield:—The only substance which gives off chlorine is chloride of lime. In the solid state, chloride of tin is safe to carry and handle. When melted it destroys wood. To do this it must be melted sufficiently to come in contact with the wood. There would also be a slight action from the effect of hydro-chloric acid, even if the chloride did not come in contact with the wood. The stave produced has evidently been rotted by chemical action, apparently by chloride of tin. I can detect the smell of hydro-chloric acid from the stave. Small quantities of chloride of tin come in bottles. If I was in the United Kingdom I should consider

casks good packages to contain it, when sent from one part of the kingdom to another. There is always sufficient moisture in the air to liquify chloride of tin. It is generally used as the mordant for the red colour in calicoes. If the cask in which chloride of tin was packed got broken, it would liquify quickly in consequence of the free access of air.

Re-examined by Mr. D'Iffanger:—For passing through the tropics I do not consider wooden casks sufficient packing for chloride of tin, as it melts at a temperature of something less than 110 degrees Fahrenheit. Otherwise I consider wooden casks suitable for even a longer voyage than that from London to this port.

This closed the defendant's case.

Mr. Litchfield then addressed the Court on behalf of the plaintiff and mentioned that the action was brought for damage sustained by cargo while in the custody of defendant in his capacity as master of the *Flintshire*. The defence set up rested on the exceptions in the bill of lading. The 6th clause of that document had manifestly nothing to do with the case, because if the chloride of tin came within the category of dangerous medical substances, then the ship owner had power under that provision to throw it overboard. The defendant apparently relied chiefly upon the exception in the bill of lading which exonerated him from loss occasioned through insufficiency of packing. As to this contention, the admission in the bill of lading that the packages had been received on board in London in good order and condition—an admission which included the contents—was binding on the defendant. Counsel quoted the case of the *Peter der Grosse* 1. L. R., Probate div. p. 414. In that case the master of a Russian ship received on board his vessel at St Petersburg, 17 bales of down and 8 bales of feathers under bills of lading in the ordinary form:—"Shipped in good order and condition, &c., to be delivered in the like good order and condition at the port of London." Certain excepted perils were enumerated in the bills of lading and in the margin there were the words, "Weight, contents, and value unknown." The ship arrived at London, and the goods were delivered to the consignees, Messrs. Schootensack, Riecken, & Co., but a great number of them were found to be in a damaged state. At the hearing of the suit instituted on behalf of the consignees against the ship, it was proved that the damaged goods were, when taken out of the ship, in an unmerchantable state, and damaged both externally and internally, and that the damage was recent, and not traceable to any inherent vice in the goods. Sir Robert Phillimore in delivering judgment said:—"There is no question whatever as to the fact that these bales were taken out of the ship in a bad condition—in what one of the witnesses has called a not merchantable condition. The question which the Court has to determine upon the evidence before it is, whether the plaintiffs [the consignees] have succeeded in maintaining the position that these bales were put on board in good order, and that, therefore, the damage must have occurred from some cause with which the plaintiffs may not be acquainted, but which could not arise from the state of the cargo itself when put on board the vessel."

His Honour:—The plaintiff in these cases has to shew that no damage has been sustained through any inherent quality of the goods.

Mr. Litchfield:—The staves are stained on the outside as well as on the inside. No doubt Dr. Divers' evidence went to prove that the chloride of tin rotted the staves, but the appearance of the fracture shows plainly that the damage has been occasioned by external as well as internal causes, and that fact once being established the onus is thrown upon the defendant to prove how the damage arose. The defendant has therefore to shew, not only that the packages are broken, but that it was occasioned in some way outside his control. Now, no evidence has been given in what state the cargo was before reaching Singapore. The vessel was laden in London and some fresh cargo was taken in at Singapore, and, according to Captain Scott, at Hongkong also, which was rather unfortunate evidence, as the ship had not stopped at Hongkong at all. The defendant should have proved, if he could, that the damage had not arisen from the weight of superincumbent cargo stowed either in London or Singapore. He must also shew conclusively that no damage has been caused by his negligence. Counsel then referred to the same case page 419, where, after reviewing the evidence, the learned Judge remarked:—"It is clear, therefore, that these goods were taken out in an unmerchantable condition, and that they were

damaged externally as well as internally; that the damage was recent; that the damage was not one which would be naturally inherent in any goods, or in the feathers and down themselves; and that the feathers and down themselves were of the very best quality. Now, these points being established, it becomes important to consider what evidence is furnished by the bill of lading as to their condition when they were put on board; and I agree with the observation which has been made by Mr. Clarkson, that, fairly construed, and giving all due effect to the marginal note, the result must be that apparently, and so far as met the eye; and externally, they were placed in good order on board this ship. Well, then, if that be so, if the plaintiffs have shewn by *prima facie* evidence that having put these bales and bags in good order on board the ship, they were taken out in bad order both externally and internally, I agree with the observation which was made that it is not incumbent on them to shew either how or when the damage was done. It is for the defendants to displace the evidence, which certainly shews that it did not occur from any internal mischief inherent in the feathers or the down, and was not one which had any external appearance when they were put on board the ship." It has also been laid down in other cases that the liability of the ship commences and all responsibility of the shipper ceases from the time the cargo is received on board. In the authority just quoted the state of the bales when taken out of the vessel was an important element in the case.

His Honour:—In the present case it is in evidence that the goods were in such a condition that they could not be delivered, and ship-owners are not under any liability to repack cargo at the end of the voyage.

Mr. Litchfield:—They have to prove that they have not been guilty of negligence. II. L. R. Ad. and Eccl. Cases p. 346. In the case of the *Freedom*, the indorsees of six parcels of oil-cake claimed to recover damages for non-delivery of the oil-cake in good order and condition. By the bills of lading six parcels of 500 bags of linseed cake were "shipped in good order and well conditioned on board the *Freedom* at New York . . . to be delivered in the like good order and condition at the port of London, the damages of the seas only excepted." The plaintiffs alleged negligence which the defendants denied, and the Court held, on motion by the defendants to order the plaintiffs to give particulars of the allegations, that they were not bound to set out the particular acts or the character of the negligence which caused the damage. Sir R. Phillimore in delivering judgment said:—"The plaintiffs contend that by the bills of lading it is only incumbent upon them to prove that the oil-cake was shipped in good, and delivered in bad, condition, and that it was for the defendants, if they could do so, to establish by proof that the deterioration was caused by the only specified exception to the obligation contained in their contract, namely 'damages of the seas'." &c. After noticing the cases quoted by counsel the learned judge goes on to say—page 349—"The cause of the damage must be presumed to be within the knowledge of the defendants, and, accordingly, in their answer they have stated what the causes of the damage were, if any damage, which they do not admit, was done. It is to be borne in mind, also, that if the fact of the damage be established by the plaintiffs, the burthen of proving affirmatively that such damage was the consequence of the excepted perils lies unquestionably upon the defendants, and I think that the burthen of proving affirmatively that due care was also taken of the goods also lies upon them. If there was negligence in this respect, it must be presumed to be within their knowledge, and it does not appear to me that the plaintiffs are bound to set out the particular acts or the character of the negligence which caused the damage on board the defendants' ship."

His Honour:—I am quite prepared to admit that the defendant has to satisfy me how the damage occurred and that due care was taken of the goods.

Mr. Litchfield:—The defendant has to shew affirmatively that every care was taken of the goods and that any damage which arose was not caused by any act of his. The casks being broken, it is not sufficient for defendant to shew that the contents are liable to melt through heat. He must also shew that no conduct of his has tended to cause the cargo to arrive in its present state. Evidence should also be adduced to rebut any presumption as to how the damage was sustained. Everyone is aware of the practice of stevedores and

railway porters, who, if they come across a small fragile package of which they are requested to take great care, pitch it down as hard as they can, and then throw the largest and heaviest case they can find on top of it; no doubt to keep it in its place. That is what probably happened to these unfortunate casks, and goes far to account for the chemical action of the contents. The evidence for the defendant is not perhaps as satisfactory as it would have been if the master of the vessel had not been absent, who could have given an account of what had occurred to the cargo. That, however, was the fault of the defendant himself, who knew very well that the suit was pending and should not be allowed to prejudice the plaintiff. The important point was altogether wanting in the defence, that there was no evidence to show that the defendant had not been guilty of negligence.

His Honour:—I do not see that there is any object in my reserving judgment as my mind is quite clear in the matter. The facts are very simple. The plaintiff was the holder of a bill of lading entitling him to receive certain goods—chloride of tin. He applied for these goods and had some staves and some stuff in Chinese matting handed over to him. Hence this action to recover the value of the goods. The evidence of the plaintiff was to the effect I have stated. The witness Cobden goes no further than to sustain the evidence of the plaintiff as to the state the goods arrived in. That witness could give no evidence as to the properties of the goods, as although he had had experience of chloride of lime, he knew nothing whatever about chloride of tin. The evidence of the plaintiff and Cobden, however, raised the presumption that the ship was liable for the damage which had occurred and this would remain so until that presumption was rebutted. The defendant called Scott, who proved that the cargo of the ship was stowed properly. Martin also gave similar evidence and that the condition of the goods was not attributable to the manner in which the vessel was stowed. The evidence of these witnesses, therefore, rebutted the presumption of bad stowage, but so far there was nothing to shew inherent vice in the goods. Upon this point a certificate was tendered in evidence, signed by a gentleman calling himself Director of the Japanese Government Laboratory. This certificate was objected to, but I need not, under the circumstances, give any opinion as to its admissibility or otherwise. However, it is manifestly more satisfactory to all parties to have the evidence of a gentleman who will come here and answer any question that may be put to him by the Court or counsel, than a mere certificate. Dr. Divers' evidence supplied the hiatus in the defendant's case, and left no doubt on my mind that the damage was occasioned by the heating of the chloride of tin. I consider, therefore, that the damage comes within the third exception in the bill of lading which relieves the defendant from responsibility for loss occasioned in consequence of insufficient packing. Dr. Divers' evidence shews that this chemical—chloride of tin—should be packed in glass or some other similar material for a voyage through the tropics, and judgment will accordingly be for the defendant, with costs of court.

## IN LIFE AND IN DEATH.

### I.

A long, old-fashioned, magnificent room, growing dim and shadowy in the twilight; a room fit to be haunted, lined with shelves full of hundreds of old books; a room that seemed really to be haunted, as the white busts gleamed out spectrally through the growing darkness. Far-stretching, silent and solitary; so large, that the one living figure in it was almost lost and swallowed up in space; so dreary in its vastness, that it was wonderful any living creature could endure to stay there.

Four great windows, side by side, looked out on a terrace, where a fountain played, and cold white nymphs stood as if turned to stone while they danced. The terrace was solitary, like the room that opened on it; only at one of the windows, leaning against the frame, and keeping a steady watch through the glass, was a man. The light was so dim even there that his figure was just plainly discernible; but it could be seen that he was not old—not, perhaps, quite young, but under middle age—slender, pale and worn. His profile against the window looked almost too delicate for a man; and his hand was painfully thin. That was all that could be seen—even that only now and then when he held up his watch to catch the light on its face.

Suddenly a soft, almost stealthily, foot came along the gravel. A woman wrapped in a large cloak, with the hood drawn over her head, came on to the terrace; the library window swung open and she stepped in.

"Is it really you, Helen, at length?"

"Am I too late? I could not come sooner."

"Not very late—but you come so seldom now, I suppose I am impatient."

She let him take off her cloak and stood quite passive while he looked at her for a moment and then bent down and kissed her. She was in a very simple evening toilet; not a tall woman, but finely and fully proportioned; old enough and beautiful enough to have suited a much richer style of dress than the plain white she wore; and with a kind of stately calm about her, even while she met her lover.

"Close the window, please," she said in her composed, musical voice: "I want to have a long talk with you, Philip."

He obeyed gladly. "I have scarcely seen you for a week," he answered, "and I have good news to-night."

"You see me three times every day—is not that enough?"

"If you call that seeing. Are there to be no more lessons, Helen?"

"I am afraid not. I did not make much progress last winter. My aunt noticed it."

His face glowed. "Last winter? No. But it was not altogether my fault. How often did you miss coming?"

"Several times, certainly. And, Philip, you know my reason."

"Lord Dainty was here, and you were often occupied."

"Other people as well as Lord Dainty were here, and I did not wish our secret to be discovered. You would certainly have ruined yourself if I had not been cautious for both."

"Perhaps you are right. But, Helen, it is hard to see so little of you as I do now."

She was silent for a moment. She had sat down in a great carved arm-chair that stood near the window, and he, standing opposite to her, leaned against the projecting side of the recess, and kept his eyes constantly on her face.

"Listen!" she said, looking up at him with a faint color flickering over her calm features. "Don't you think that this constant dissimulation has lasted long enough? Don't you think this secret-keeping ought to be put an end to?"

"Do you consent, then?" he cried eagerly.

"Hush! Hush! You misunderstand—"

"For three years," he went on quickly, "we have been living a lie: better the truth with any penalties it may bring, than to go on like this!"

"Yes, I am glad you think so."

"My darling, I began to fear I cannot tell what. Only to-night, as I waited, I thought you had tired of me; and now you will give yourself to me openly!"

He knelt at her feet—he took one of her hands and covered it with kisses.

"Stay," she answered. "Don't deceive yourself, or let me deceive you—that, at least, I have never done."

Something in her voice sounded as if she were trembling, and forcing herself to stand on the defensive against an accusation. She laid her other hand over his two with a kind of reluctant caress.

"I mean simply," she said, "that our engagement ought to be broken off."

The clasp of his fingers relaxed. He fell back a little, as if he had been struck, then grasped her hand more firmly than before.

"You are jesting!" he asked. He dare not assert that it was so—Helen Fortescue seldom joked; but he asked it in an agony.

"No," she answered. "You are hurting me. I am quite in earnest."

He got up, turned away from her, and went into the darkness of the room, staggering and catching at the tables and chairs as he went. She sat still by the window, with the pale light falling upon her golden hair, while she considered what she should say next to him.

He went all the length of the room, and came back to his former place opposite her, deadly pale, but ready to listen.

"I do not know," she began again. "Why I have not said this before. I have thought it for some time. We were very foolish three years ago, both of us; but we are not children now—not boy and girl, that we should not be able to give up our romance. My aunt's health is giving way, and, as you know, her income dies with her; when she is dead my uncle will have to live less expensively—he will think, first of all, of ridding himself of useless encumbrances. In fact, my home here, such as it is, is every day in greater danger. I ought to think of the future."

"Have you not thought? and I for you! Helen, you have been faithful to me so long, don't, don't change now. For heaven's sake be patient a little!"

"Is it a question of patience?"

"Yes, only that. To-day, this very day, I have had an appointment offered me."

She raised her head a little with a quick inquiring movement. She had loved him once, in her fashion; perhaps did still. She had been used to think that, with his foot on the first step of the ladder of success, he would certainly reach the top. If he had that first step now, she might still be true to him. But it struck her that there was a singular hesitation in his manner.

"It is a good thing," he went on, "almost an unhopied-for fortune; and yet it has its dark side. I should have to leave you for a year."

"Well?" she said, impatiently, as if that were a light thing.

"And it comes from a quarter I don't like."

"Can you afford to have preferences? I cannot."

"No, truly. But this is from Mr. Stuart, Lord Dainty's brother. He wants a private secretary, and will take me. It is in itself a much better thing than this, and will lead to something more."

"And yet you do not like it! Why not, Philip?"

"I think you know. You will say it is foolish; but except for the sake of making sure of you, I would not take it. With your promise, and for your sake, I will."

"And that very promise would deprive you of it. No, Philip,

you must take it—the first chance of prosperity which has come to you—but you must take it without me.”

“Never. Why, but for you, should I care for it? I have all the necessities of life here—and you.”

He came to her side and laid his hand softly in her hair, which still gleamed golden through the half darkness; but she leaned back in her chair, moving her head from under his touch.

“I have something to tell you also,” she said, “and you will not like to hear it. This morning I had a letter which is of importance to both of us.”

She paused a moment, shook off all hesitation, and went on quickly.

“Lord Daintree wishes me to marry him. He is rich, and I am tired of poverty; he is anxious to give me a home, and I am certain soon to want one. Ought I to refuse him?”

“You have accepted him! Your word to me is nothing, Helen!” He spoke brokenly and harshly.

“Not yet. I must answer his letter to-morrow.”

Suddenly he fell, half kneeling, before her, grasping her hands again passionately.

“You cannot do it!” he cried. “You are mine, and I will not give you up. I could not live and lose you.”

“Hush, pray hush, dear Philip!” she answered, soothing him as if he were an intractable child. “You see that I have come to consult you. I have done nothing, said nothing yet, that you need complain of.”

“You come to consult me?” he repeated bitterly. “Do you come to ask me whether I will give you up to this man who is rich, and can make you a countess?”

“Honestly, yes.”

“And you said you loved me!”

“I did—I do. But you know what I am and what our prospects, both of us, are. I don’t think I could bear to live in a small house, to have everything about me poor and miserable and straitened. It has been bad enough here as a dependent. It grows worse and worse as I grow older. I am weary of my life. Release me, Philip. Let us each seek something better for ourselves than this hopeless waiting.”

“I too am weary of life.”

He got up and stood facing her; while she also startled by something in his tone, rose, and waited with her hand upon the arm of her chair.

“Helen,” he went on, “there has been one inequality between us always. You have, when you choose, an iron will. I am naturally weak, easily persuaded. You have made up your mind to break your word to me, and to marry this Earl. You will do it. But for once I am as resolute as you. Here, in this very place where three years ago you promised solemnly in the sight of heaven to be my wife—here, where you have over and over again repeated your promise. I tell you I never will release you from it. To marry whom you will—get all the good you can from your bargain; but, married or single, rich or poor, living or dying, you are mine!”

He had raised his head with a threatening gesture. His words sounded like a curse. For all her steady nerves, she shuddered.

“Philip! hear me—let me speak—” she cried.

“No more. If I have been blind, it has been wilfully. Now I see. But you are bound, now and forever, in life and in death.”

He broke from her; and rushing away, through the window, past the white nymphs, and was lost instantly in the darkness.

## II.

The morning had been fair and lovely—village children were out gathering flowers and weaving garlands, according to their custom, to strew the bride’s path; but at 10 o’clock all changed. A heavy black cloud rose from the horizon, and passed before the sun: a strong, fierce wind seemed to follow it, and, shrieking round the church, swept the flowers from the path, and tore down the arch above the gateway. It fell with a crash upon the roof of the carriage, which that moment passed, carrying Helen Fortescue to her marriage. The startled horses plunged, and could hardly be drawn up at the church door; but the bride stepped out, calm as ever, though her face was deadly pale, and its delicate lines drawn in unnatural hardness. Her uncle, a feeble, querulous old man, followed her trembling, and as they passed into the aisle the storm burst. Sheets of rain fell like a deluge, vivid flashes of lightning shone, and quick terrified peals of thunder rattled over the building. The party gathered round the altar, but there was a minute’s pause while the clergyman waited for a lull in the storm before he commenced the service.

The lull came—heavy, deathlike, ominous. The darkness seemed to increase, but through the silence the clergyman’s voice was heard, low and unsteady at first, but rising fuller and clearer each moment, till he came to the words, “If any man can show just cause why they may not lawfully be joined together, let him now speak, or else hereafter forever hold his peace.”

“Then, at that instant, a peal of thunder, louder than before, shook the building; crash after crash it came, and in the midst of it a voice cried, “There is a cause. Before God I forbid this marriage,” but the thunder and the voice ceased, and the speaker was invisible. The frightened guests looked at each other, and then into the dim corners and recesses of the church, but there was no one but themselves and the old sexton cowering and trembling behind a monument. The bride caught at the altar rail, but neither cried out nor fainted; the bridegroom glanced round laughingly, hiding his dismay under a show of pride. The Vicar, stepping back, called aloud to the unknown to come forward, but none answered. A second and a third time he called, but in vain. Then they began to say that it must have been fancy—that the thunder had sounded like a voice—and that the marriage should go on.

So it went on: “I require and charge you both, as you will answer at the dreadful day of judgment, when the secret of all hearts shall be disclosed, that if either of you know any impediment why ye may not be lawfully joined together—”

A strong shudder seized the bride, and shook the cloudy folds of her veil; but she repressed it, making no sign of hesitation. Then, in the pause after that solemn adjuration, there came another mysterious response, audible through all the church—an inarticulated sound, that was neither sigh nor groan, but more full of despair than even was either. And still there was no one visible. It might have been some strange effect of the wind, which still swept in stormy gusts round the building, rattling the windows and whistling through the crevices in the stone-work. But whatever it might be, it was not repeated. The marriage went on; and Helen, Countess of Daintree, turned from the altar to receive the congratulations of her friends.

“But oh, my dear,” said one lady to her grand-daughter, as they drove home to the Hall, “it is an ill-omened wedding. She tried hard for him, and she has got him; and I believe in my heart that she is a woman who would get what she wanted if she had to step over the body of her best friend to reach it. But it is a strange wedding!”

“Grandmamma, don’t say such horrid things! She is excessively handsome, and clever and charming. I don’t wonder he fell in love with her.”

“Charming!” and the old lady laughed scornfully. “Yes, they say poor Philip Conway found that out long ago—as well as others.”

“Philip Conway? Her uncle’s secretary? Why, grandmamma, you would not let me be civil to him.”

“You? That’s a different thing. He’s her cousin a few times removed, and quite as good as she is. However, it’s not my affair—nor yours. Ugh! what rascals!”

The bridal party reached the Hall while the storm was still at its height. They sat down to breakfast, and the depression and sense of awe which had been inspired by the tempest, and by the interruption of the service, passed gradually away. Speeches were made and toasts drunk, and the bride looked calm and lovely, and—except that she appeared perhaps a shade too calm—was perfect. But she stayed not one unnecessary moment. Her silent will broke up the party, and she found herself for the last time in her own simple solitary chamber. Her dress was changed, and she was ready for her journey, but at the very last she desired to be left alone. Then she locked the door and listened intently for a moment. She took a key from a hiding place in the back of her wardrobe, and unlocked the only drawer which was not empty. Even in that there was not much—a small packet of letters and notes, a small likeness done in water-colors, a book of verses. She took them out, lifting them with strange tenderness, and carried them to the hearth. That morning she had said she was chilly, and asked for a fire—it still burned brightly. She moved the coals, making a hollow in the hottest place, then quietly put the whole pile of things she held down into it. Then she clasped her two hands together, almost wringing them, and with a long, sobbing sigh, watched the fire gradually devour them.

But when she turned away and opened the door, and met her uncle coming up to fetch her, she went forward smiling to take his arm, without a cloud on her face. The old man was trembling and infirm, and they went slowly along the gallery till they drew near the staircase, when there were voices heard speaking loud and angrily below. All at once they ceased, and Philip Conway, dripping with rain, splashed with mud, torn, dishevelled, panting, rushed up the stairs in great strides. Face to face with the uncle and niece he stood a moment, laboring to speak—then suddenly his figure swayed, and he fell heavily forward at their feet.

One shriek burst from the new-made countess. Her husband, standing below waiting for her coming, heard it, and came to her. Others, servants and guests, came too. They lifted aside the body and let her pass. “He has fainted,” she said, in her soft steady voice; and behind her they said, “He is dead!”

The carriage stood at the door. Why should she delay her going because Philip Conway had fainted, or died, in her sight! The Earl and Countess were well on their way when the surgeon said those few words to Mr. Gaysborough, “Quite dead. Disease of the heart.”

## III.

Ten years since Helen Fortescue, poor and handsome, was changed into Helen, Countess of Daintree, rich and powerful. Ten years since Philip Conway was lifted, dead, out of the bride’s path. Nearly ten years since Gaysborough passed into the hands of strangers, and the story of that ill-omened wedding-day began to fade among the other traditions of the “old family.”

But in a distant country Lady Daintree shone as a star and reigned as a queen. No one had yet begun to say that the star was paling, the queen losing her inherent right or power of ruling. The Earl was her first subject—no more. Over him, and over the rest of the world, she maintained her ascendancy by two forces, distinct but allied—her beauty and her will. As for her beauty it had not waned by so much as a shade. It had shone out, after her brilliant marriage, in the most wonderful perfection—a beauty not only above criticism—imperial, absolute. She might have been a beggar maid or a king’s daughter—people soon ceased to trouble themselves with her antecedents; she made her beauty serve for family, fortune and training. Thus she gained her throne; having gained it her will kept it.

And now that she had been so long a successful woman, one class of persons alone spoke evil of her. To her maids she was no divinity. There were enough of them; for she seldom kept one about her more than a few months, and they all went away in the same mind. “She has an awful temper,” they said, “and seems as if

she never could be quiet for a minute. All the money in England would not pay one to face her, as she looks sometimes."

One other strange thing was known about her. She had consulted—no one knew on what subject—a certain clairvoyant, or dealer in supernatural mysteries, and had, moreover, been obliged to change colour when the subject was named, and to shudder involuntarily when disbelief in it was asserted in her presence. That she herself did believe in things not dreamed of in philosophy, was the consequent opinion of her friends—but it was a matter on which she refused to speak.

It was the Earl's pleasure as well as hers that their house in Blankshire should be a hospitable one. They spent most of the year there, and they were never alone. No matter how unpromising the season, they had always a party, and almost always it was large and gay. There were perpetual morning and evening amusements, a continual ebb and flow of dinner guests, and everything to make a dinner invitation worth accepting.

Perhaps this was the aspect of the case which presented itself most vividly to the masculine minds of the neighborhood. A fine house, a pleasant host, a beautiful hostess, a faultless dinner, and wines not to be equalled in the country—every man could appreciate these; every man accordingly appreciated the Countess's invitations.

One of these invitations was the subject of a little discussion one evening. It had been sent to Ralph Murchison, a young squire of the neighborhood, and he, going to his letter-case to find something else, had just pulled it out and tossed it to his friend and guest, Captain Conway.

"It includes you," he said. "All right. I was over there playing croquet yesterday, and took an opportunity of telling the Countess I expected you. Before I came away she begged me to bring you, to-morrow, which I promised. So you are booked."

"I don't believe there's a soul I know there," Conway answered, twisting the note round his fingers.

"More shame for you, then. There's the jolliest people in England always there, and it's the jolliest house to meet them at."

"Lady Daintry can't be very young," Conway said, irreverently, after a little pause, and through a cloud of smoke.

Ralph went off into a fit of laughter. "By Jove it is easy enough to see that you don't know her! The bare idea of talking of a woman like that not being very young!"

"Well, upon my word, I don't see the joke!"

"Why, man, she is scarcely a woman at all—she is a goddess! Do you suppose that because when we were small boys in Lower Fourth at Eton she was turning the heads of all London, therefore she can't turn any now? If you do, you are certainly mistaken. By Jove, there is not another woman in England to compare to her!"

"I'll tell you my opinion to-morrow night."

"Oh, I know it beforehand. You can't help yourself. But, do you know, I had a kind of half idea that she and you must be related."

"Had you? So we are—distantly."

"Explain it, old fellow. I only wish I could make her out a cousin of mine."

Conway knocked the ashes off his cigar, stretched himself comfortably back in his chair, blew a whiff or two lazily, and then answered, in a provokingly deliberate manner between the puffs, "Her great-grandmother and my grandmother were sisters."

"Is that humbug?"

"No; truth."

"You seem to be pretty well up in the relationship, after all."

"Yes, I am. Don't you know that I was brought up by a maiden aunt?"

"And she made you learn your genealogy?"

"Not exactly. I remember that particular relationship for a particular reason."

"What was that?"

"Can't you let a fellow smoke in peace?"

"Not if peace means silence. I had enough of that before you came. Go on."

"I remember it because I found various allusions to it in some papers which belonged to Philip, my elder brother."

"Never knew you had a brother."

"Perhaps not. He died ten years ago; about the time you were speaking of when we were in Lower Fourth."

"He must have been a good deal older than you."

"Fourteen or fifteen years. He was my half-brother, and I scarcely ever saw him. He was my guardian, however, the little time he lived, and a good one too."

"Did he know Lady Daintry?"

"Helen Fortescue she was then. He could not very well help knowing her, for they lived in the same house."

"How was that?"

"Philip was secretary to old Gaysborough of Gaysborough, who was a distant relation of ours, and who had married an aunt of your friend's. She, I suppose was an orphan—at any rate she lived with her aunt, and married from there."

"Well."

"Well, that's all. Poor Philip died there—died suddenly of heart disease, and what few papers and so on he left went to my aunt where on her death I found them. There were notes or memoranda, and Miss Fortescue was sometimes mentioned."

"I shall introduce you as a cousin."

"As you please; but I think it would be as well not."

Their talk rambled off after that to other subjects, and never came back to the relationship between the beautiful countess and the young soldier until the two friends were driving to the dinner party which they had discussed over their cigars.

"Well, Charlie," Murchison then said, "will you go in for cousinship or not?"

"No—at any rate not at present; so please keep quiet on the subject."

"As you like. Here we are."

They were all but late. So near it, indeed, that Conway had but one momentary glimpse of Lady Daintry as she received them before dinner was announced. He found himself, however, at no great distance from her at table, and Murchison smiled to himself as he saw his friend's eye turn instantly toward her.

"Ah," he thought slyly, "he'll be glad enough by and by to claim kindred."

But as dinner progressed, Conway still looked at the Countess. He said nothing to the lady beside him—he put away the dishes that were offered him—he did nothing but stare fixedly at his hostess. Again and again his introducer glanced across the table at him; with surprise and displeasure he noticed his extraordinary behaviour, and tried to attract his attention. No efforts were of the least use. Conway, when spoken to, either answered shortly or not at all—when merely looked at, remained evidently unconscious of the look. One after another the people who sat near seemed to become aware of something singular in his demeanour; the Countess alone paid no heed to it. Perhaps she was too much accustomed to admiration to be discomposed by the regard of a stranger—and yet the one now fixed on her might have been embarrassing from the very fact that it was not admiring. What did it express? Fear? surprise? incredulity? horror? All these, perhaps—nothing less strange and misplaced.

"What the deuce does that fellow mean?" Murchison thought to himself uneasily. "Has he gone mad all at once? or what is it? Everybody is beginning to notice him. Won't I give him a blowing up when I get hold of him!"

But as the long ceremony of dinner progressed, Ralph grew more and more uncomfortable. He saw that the influence of his friend's silence and strange behaviour was making itself felt—it seemed at last even to reach the Countess. She still talked with her usual grace to those beside her; but she grew slightly paler, and once looked for a moment steadily at Conway. Murchison, watching anxiously, was struck by the fact that, while her eyes evidently rested for that moment on the young soldier's face, his did not change or falter as if he met her glance, but rather seemed to look over or beyond her. She continued her conversation and he his gaze.

At last, when dinner seemed to have lasted twice the ordinary time, Lady Daintry rose.

The moment the ladies had passed out, and the door was shut, Conway turned to the gentleman next him, and in a voice full of horror asked, "Did you see it?"

"See what?" the other returned, and Ralph leaned across the table to listen.

"The figure that stood behind the Countess—a tall man, who mimicked everything she did."

The stranger drew a little further away; he evidently thought his neighbour was mad; and Ralph, coming round, took the empty place.

"Did you see it?"

"I saw you behaving as if you were out of your senses. What on earth did it all mean?"

"I don't know—except this. As we sat down to table there came a—thing—and stood behind Lady Daintry's chair. It seemed to come with her into the room. It stood there the whole time, now on one side, and now on the other. Whatever she did, it did; and it followed her away just now."

He shuddered, and Murchison shuddered too. There could be no doubt that he believed he had seen this—thing.

"But what was it like?"

"Like the shadow of a man—if it was like anything. A shadow having substance, if you can understand that."

"I daresay it was a shadow."

"Look at the place where it stood. The light is full, bright, equally diffused. No shadow could be there."

"Imagination, then."

"As you will; only never ask me to sit in the room with it again."

Murchison paused for a moment. He tried to persuade himself that Conway was practising a foolish hoax—that he had too much wine—even that this might be the first illusion of a coming fever. But none of these theories would stand. Conway was of a cool, unimpassioned temper, not the least given to practical jokes; he had not the faintest sign of physical illness about him. What he did show were strong, unmistakable symptoms of horror, and of perfect good faith.

Yet it might have been some fantastic effect of light and shade; and if so, it would certainly not reappear in the drawing-room.

"Come," he said, "let us go and join the ladies. If it was a shadow it will stay here."

"It is no use. And, to tell the truth, I shall be glad to get out of the house. Make some excuse for me—there's a good fellow."

"And let you go away with the idea that you have seen a ghost? I thought you had more pluck."

"Look here, Ralph, it is no use talking in that way. I say nothing about ghosts. I only say that I have seen—and I don't know why you should not have seen too—what I described to you. If I saw it again ever so often it would make no difference to me, except that it is uncanny—more than that, horrible—to see it standing there mocking everything she does." He shuddered. "And I suppose you don't entertain any idea of trying to lay the ghost, as you call it. I doubt whether the Countess would thank you."

"The Countess? Do you imagine she has any consciousness of it?"

"How can I tell? All I know, you know."

"Very well, then, come into the drawing-room, and try to find out something more."

He was obstinate, being fairly divided now between belief and unbelief, and Conway was obliged to yield. There were about a dozen ladies, young and old, in the room when he entered. Lady Daintry was sitting on a sofa talking to a dowager in black velvet

and diamonds. They were a curious contrast—one old, wrinkled, and shrivelled, gorgeous in black and scarlet and flashing light; the other in the very perfection of beauty, in a rich quaint dress of pure white. But behind them, standing so that the Countess's golden hair seemed to touch its breast, stood the dark shadow. Conway told Ralph by a look that it was there.

They separated immediately, and Conway found himself near the lady he had taken in to dinner. She was the only person with whom he had the slightest link of acquaintance, and she, after his neglect, was not disposed to be very gracious. He turned his back upon the sofa, and applied himself to being civil to her.

But it was a task beyond his powers. He felt himself drawn back irresistibly to look at the Countess. Other men had now come in, and she had left her seat; but wherever she went the shadow followed her, moving as she moved, and keeping always so near that it seemed as if she had put out her hand and touch it. Seeing this, Conway soon ceased to be able to see any thing else. He found a quiet corner and pretended to look at some photographs, but his eyes continually followed the spectre.

Once Murchison came to him.

"Well," he said, "is it there still?"

"It stands in the corner, between her and the piano. There, that girl who is going to play almost touched it!"

As Ralph strained his eyes following the direction of Conway's, he became aware that Lady Dainty was watching them both. She moved abruptly from the place where she stood, and cast a rapid, almost imperceptible glance backward over her shoulder. He fancied he saw her lip quiver and her colour change. Next moment, however, she deliberately crossed the room, and coming up to Conway, spoke to him.

It was only some question or remark about those photographs which he had not looked at; but while she spoke, and he answered, a curious scrutiny was going on. His looks, instead of resting on her face, went past her to the thing standing close behind; hers seemed to express suspicion, distrust, uncertainty. Her words were very sweet and gracious, her voice soft and unconstrained; but Murchison said to himself, "Does she know of it? Does she fear anything? Is it real after all?" Then he became aware that the Countess had asked a question to which Conway gave no answer. She stood waiting, the expression of her face deepening into an indescribable mixture of pride and terror, as he, bending a little forward, was wholly absorbed in the discovery, as it seemed, of some new revelation. Murchison made a step forward. The Countess turned suddenly away, pale as ashes, and Conway drew a deep breath of relief and turned to his friend.

"Ralph," he said, "I must go. Heaven knows why I should be the only person to know her secret, but I can't stay here longer and keep it. Are you ready?"

"What was the matter just now?"

"What could possess her to come and talk to me? I told you there seemed to be a dark mist about its head. Well, while she spoke, it leaned over her shoulder, and the mist seemed to open. I could see its face distinctly."

"What was it like?"

"A corpse! The features set and pinched and white—that was all I could make out."

"She suspects something. Come, we had better go."

They moved slowly toward the door. Murchison stopping here and there to speak to an acquaintance as he passed. But as the last moment he again turned to Conway.

"Look once more," he said; and as he spoke he felt himself shudder, for the horror of the vision had begun to affect him. "Take one last deliberate look at her, and don't carry away any fancies."

Conway obeyed. He glanced round the room in search of the Countess. She was quite at the further end and had her hand on the handle of the door, as if going out; but at the moment the two friends paused, looking at her, some one spoke to her and she turned from the door to reply. Murchison just perceived this, and then trying in Conway's face to discover what he saw, took alarm at the awful pallor which crept over it, and drew him quickly out into the hall.

"For heaven's sake what is it?"

For a moment Conway seemed unable to answer. His lips were white and stiff, his hands trembled, and he grasped his friend's arm to support himself.

"The mist was almost gone from about it," he said at last. "It is a corpse, long dead, decaying, livid, phosphorescent—I don't know what to say—it glimmers—it has shreds of a shroud hanging about it. Oh, it is horrible! horrible!"

He trembled convulsively. Murchison's own nerves thrilled.

"Come into the dining-room a minute," he said, "there are two or three men there yet, and then we'll be off."

They went in. It was still early, and the host sat patiently waiting the end of a political argument. Three or four of the guests were absorbed in it; they formed a little group at one end of the table. The rest of the room was empty. The two young men, after exchanging a word or two with the Earl, sat down apart, and Murchison asked:

"You saw it more clearly, then?"

"Yes, quite clearly. Don't ask about it now, I'll answer all your questions after."

"Better do it now. It is either fancy, or else the most awful visitation that ever mortal was subject to."

"Fancy! I tell you it is no fancy. You saw her take her hand off the handle of the door when that girl spoke to her? Well, the thing put its horrible hand on the handle as if to open the door, and its other arm was round her—not close, not absolutely holding her, but making as if it would open the door and draw her into the next room. But the horror was, that it loosed the

handle and raised its arm as I looked, and looked at me and beckoned!"

Their talk was suddenly interrupted. A shriek, ringing through the house, broke it off. Doors opened and shut in all directions; and the whole party, rushing into the hall, found servants hurrying wildly about, and the Countess's French maid screaming and exclaiming:

"My lady! my lady! She is dying—she is dead—she is poisoned! *Malheureuse que je suis!*"

Struggling on with the crowd the two friends reached the door of a small drawing-room opening from the larger one. In a low chair near the fire, sat the Countess, her eyes closed, her face white and rigid. A coffee-cup had fallen from her hand, and lay broken on the floor—a stream of the dark liquid marked her rich white dress. Beside her, on a table, was a small case, and the room was full of a subtle deadly odour. As the bolder or more intimate visitors gathered round, following the Earl, Conway laid his hand on Murchison's shoulder.

"There it is!" he said, "close beside her, bending down. It puts its arm round her."

The rigid figure so still in the midst of the terrified excitement, suddenly moved. The Countess opened her eyes. She turned her head slowly, as if looking for some one close at her side.

"At last, Philip!" she said distinctly, and died.—*Blackwood.*

## DR. MANUEL PEDRO DERANOGOZO'S BOLD EXPERIMENT.

On September the 5th, 1871, the town of Arica, in Peru, was startled by the commission of a dastardly murder. Francisco Hanna, in a fit of jealous anger, brutally decapitated his sweetheart with an axe. He was tried and sentenced to be executed by the garrote, when Doctor Manuel Pedro Deranogozo, formerly a Professor of Anatomy in the University of Lima, Peru, who was then, as he had been for years, engaged in his studies on the nerve centres, made a strange application to President Prado. The application was nothing less than that, as the murderer Hanna had forfeited his life, instead of being executed he should be given up to the applicant, who intended to make him the subject of certain experiments, the result of which might possibly prove fatal to the subject, in which case he would only suffer the just penalty of his crime, whilst they would positively be valuable as a contribution to a branch of medical science which, from the very force of circumstances, could be but very imperfectly entered into unless some such exceptional opportunity as this were availed of. President Prado took the matter under consideration, and the result was that, as the document read "in the interest of science, the body of the said Francisco Hanna was delivered up to Doctor Deranogozo, to be by him used as he saw fit." A private execution was announced, and to the Peruvian public Hanna suffered capital punishment January 3, 1872.

The very morning on which Deranogozo became the custodian of the prisoner, he commenced his researches. "The night before the date of the supposed execution," said the Doctor, who related his story to a reporter of the *Chronicle* on the eve of his departure for the East, en route to Europe, "I had caused a strong opiate to be administered to Hanna, so that when the two officers of the law laid their burden on the table of my dissecting-room, it was inert and senseless. The subject was a huge muscular man of about 25 years of age, with what you call a bad face. I must own," avowed the Doctor, "that I felt nervous when I considered what the result might be if such a dangerous character were brought to consciousness by my work, and if he should struggle with me for his life and liberty. I may as well tell you here that I had for aim, to prove at once, definitely and for ever, either that a man could or could not live after the removal of his brain. The cases in which this had been partially and brutally done by accident or on the battlefield, I was, of course, acquainted with; but I had never considered that these cases were in the least satisfactory. What I wanted done, and what for the first time in the history of the world I was about to do, was to carefully, scientifically, and gradually remove the human brain. You will of course at once see, too, that by experiments, the science of phrenology would be for the first time legitimately tested.

"Of course I was familiar with the result of the experiments made by Flourens, the apostle of vivisection, and had followed in the footsteps of Louget Onimus, Bonillaud and Goltz, whilst where Vulpian had boldly gone I had unhesitatingly marched after. Since 1869 I had experimented on the lower animals, but even the removal of the cerebral hemispheres of a dog did not satisfy me. I found that the animals thus operated upon—mutilated, if you will—in some instances retained general sensibility and power of voluntary movement, but lost the use of the senses of sight, hearing, taste and smell. In the case of other animals I found that the removal of one or part of both hemispheres was followed by no marked effects as regarded the intelligence or instinct of the animal, but that an incapability of spontaneous, voluntary movement was the result. The brain of a man was still an unexplored field, for hitherto the experiments had been made *post mortem*, and had only resulted in showing the possible cause of an effect previously visible. 'To be sure,' continued the Doctor, with growing enthusiasm, "I knew that a person may lose part of his brain and yet not exhibit any mental deficiency or disorder. I knew, too, that there had been cases, indeed one has come under my own notice, where one hemisphere may do the work of the whole cephalic ganglion. But all this only pointed to, without touching, the great point at which I aimed. At last I was going to see whether the supposition that certain parts of the brain, bound together as they are by commissural fibres, or fibres of association, have in reality separate and peculiar properties and functions. I was going to see what would be the result of the extirpation of one or more of the brain's convolutions, leaving the

others intact as far as possible. I was going to carry this remarkable work to an extent that no one had done more than dream of. In a word, I was going to try whether the brain was the centre of all thought and action, and prove, by actual flogging of the instrument, whether the whitely mass we so proudly use as a figure of speech for all that is intelligent, progressive, learned, even God-like, is really the sounding-string that set a world vibrating, or only the key-board which is simply an admirably constructed but purely mechanical system of leverage."

The Doctor's manner had grown more and more excited as he was uttering the above words. The eyes sparkled, the nostrils dilated, and he took off his hat to rub his thick crop of hair that actually seemed to bristle. Quietly down as suddenly, however, he drew a cigarette from his pocket and having lighted it continued as follows: "Looking at Hansa," he said, "who was to involuntarily aid me in these immense researches, I fancied I detected a slight tremor of his eyelids. I immediately applied a strong anæsthetic to his nostrils, and propping up his head and shoulders, commenced to work. The prisoner's hair was already cut short, or cropped, as you say, and a few strokes of the razor cleared out a blue-black space behind the left ear at the base of the occiput. Exactly, you are right: I was about to make my first move by destroying his combativeness. A necessary precaution, since, as you see, I am a small man, and he made for himself an evil reputation by his ferocious conduct while under confinement. Some, I have no doubt, would immediately have annihilated the cerebellum, and so at one stroke have destroyed the president of voluntary movement, but I preferred to go step by step gently to work. Close at hand on the operating table were my silver plates and a specially constructed trepan of large size. Making a cross incision in the scalp that overlaid the protuberance that was in itself an evidence of the truth of phrenology, I laid back the skin and set my crown saw to work. The skull was of unusual thickness, but my hand seemed gifted with unaccustomed vigor, and the round piece of bone was soon lifted from its position. Very delicately I severed the tough, pearly white dura-mater, removed the web-like arachnoid, and then hesitated a moment as the soft pin-matter allowed me to see the brain beneath. It was but a moment's hesitation, however, and separating as well as I could the particular convolution of which I was in search, I did my best to keep the knife from the larger blood-vessels, and the next instant Hansa was minus the first portion of his brain."

"I had barely time to apply a styptic, set in my silver plate and bandage his head, when my subject awoke to consciousness. He sat up, looked around, carried his hand to his head, and then asked if he were in hell or heaven. I had my story prepared, and told him that a friend had attempted to rescue him during the past night whilst asleep, but that before he was awakened the guards had become alarmed, and in a struggle he, Hansa, had received a blow from the butt-end of a carbine, which, it was thought, had been fatal. 'In this belief,' I said, 'you were brought to me as a dead body, as I am Doctor Deranogozo, Professor of Anatomy, for purposes which you will understand,' I concluded, pointedly."

"The poor wretch leapt from the table and fell on his knees at my feet. 'And now,' said he, 'now that you have discovered me to be still alive, you will not give me back to the executioner?'"

"No, you are safe with me; but you must remain here as quietly as possible for some time, until, indeed, I think it safe for you to leave."

"He would do anything, he said, and the quarrelsome, brutal man became from that time one of the most docile of servants. He did my bidding, it is true, as obediently as a child, but even after the fever consequent on the operation had subsided he displayed an almost infantile irritability toward inanimate objects with which he might happen to come in contact. Every day, almost every hour, and this even in my presence, he would break, tear or somehow destroy whatever article he could lay hands on. Reasoned with, he would express both sorrow and surprise, for he declared he never remembered having been so clumsy before, and once he stated, after having swept a statuette from its place, that his action followed an unaccountable and ungovernable impulse. This set me thinking, and I soon came to the conclusion that the removal of the convolution of combativeness had resulted in an irritation or inflammation of its neighbour, the convolution of destructiveness. It was just when I came to this conclusion that my patient was seized with a new freak. He became a veritable magpie, and now hid as persistently as he had broken. But instead of puzzling me, this second trick convinced me that I was right in my surmise, and I became sure that the irritation had spread to the organ of secretiveness. Especially was I certain of this when I noticed a disposition on Hansa's part to conceal his intentions. Fearful as to the result which this novel trait might bring about if left unchecked, I resolved to eradicate the cause."

"Under a trivial pretext, therefore, I made him inhale chloroform, and for the second time visited the interior of my patient's cranium. This time, to make matters sure, I trepanned both sides, and removed from the right and left the brain convolutions of destructiveness and secretiveness. The operation was successfully conducted, but although I supposed my explanation to him that the now smarting places on his head were due to a necessary treatment of the old wound, which, I informed him, had begun to look a little ugly, would be sufficient, he seemed to listen to the explanation with a marked lack of credence. Several times after that I caught him cying me attentively, and it was very evident that Hansa's suspicions were aroused. He would not even allow me to replace the bandages on his head, and it was only when a fever set in, accompanied by delirium, that I was enabled to make an examination. I removed one of the last-fixed silver plates, and on inspecting the lessened brain, found, as I had surmised, that the convolution of cautiousness, which lies directly above that of secretiveness, was in a highly inflamed condition. I would have remedied this at once, but that I was afraid what the consequences

of further vivisection might be upon Hansa in his then weakened state. I watched him carefully, in fact, I may say, tenderly, for eight weeks, at the end of which he was convalescent. It was not, however, until three months after, that I determined to push my experiments further. I decided to make a *grand coup*. 'This trepanning business,' I said to myself, 'is too confined in its results: it does not give me liberty of action; I must have full access to the seat of my researches.' Besides, I was convinced that the setting of the brain to fill up the vacancies caused by removal would stand as a difficulty in the way of my proceeding further upon a phrenological basis. So I had an ivory dome made to fit in place of the crown of Hansa's skull. He was reduced to insensibility, and whilst he was unable to move hand or foot, I plied my instruments to such good effect that in a very few minutes the whole upper portion of the parietal bones was removed for an oval space of four by six inches. The brain that remained seemed surprisingly active and healthy, and I could not help a smile as I remembered the words of the English poet, Shakespeare, that

The times have been  
That, when the brains were out, the man would die,  
And there an end.

I smiled, too, as one by one I removed what I judged to be the convolutions of self-esteem, cautiousness and firmness, to think how thoroughly I was making Hansa a creature of my own. Talk about Frankenstein—why, his horrible manufacture followed no will but its abominable own, whilst here was I bending some one else's work to my own volition. Frankenstein modelled an image out of ghastly clay and then had to flee from his monument of dread: I was taking a statue cast by a superior power and remodeling it to suit my convenience, my fancy if you will."

"I shall not weary you," said the Doctor to the reporter on the third day of their acquaintance—for it must not be understood that all the above information was gained during a single interview—"I shall not weary you by relating in detail all the events that attend the succession of experiments which followed: nor shall I give you the opinion that I am a pedant by indulging in a long, learned talk upon the various psychological and mental phenomena which accompanied this denudation of the home of intellect. Let it be sufficient to know that with all the ardour—and heartlessness, if you will—of a scientist, I again and again explored Hansa's skull and removed organ after organ of mentality, until he became a being without love or hatred, without hope or despair, without veneration or irreverence, without imagination or ideas of any sort—in fact, a brainless creature, an animal without even animal tastes, a man without a thought, a something absolutely without sense, one who from being 'a little lower than the angels,' had been brought down infinitely beneath the 'brute beast that perisheth.'"

"And he still lived?" asked the wondering reporter.

"Still lived!" echoed the excited Doctor, lifting his right hand high up and then bringing it smartly down upon the open palm of his left. "He still *lives*, sir!"

Here the reporter saw a way to arrive at a coveted end, and, half seriously, half sarcastically, as if the statement were a good joke and nothing else, he professed utter disbelief in the statement. Deranogozo at once took fire, and with the proviso already mentioned as to publication, invited his companion to accompany him to his room. Whilst proceeding there the Doctor explained the reason of his coming to San Francisco. "You know," he said, "of the troubles which have fallen upon my unhappy country. The political and then military disturbances interfered seriously with my peaceful labors. Pierola was no friend of mine, I did not know when the cursal Chilians might follow up our disasters at Piangua, Angamos and Iquique by an attack on Callao, and being a native of San Francisco—not this San Francisco, but our San Francisco in Peru—I took heed of the coincidence and resolved to quit South America and come here. I left Peru early in December last, the interval between this and that time having been spent at Punta Arena, where I have a brother living."

"And do you intend remaining here?" asked the reporter.

"Oh, no," answered the Doctor, "I go East—that is, we go East to-morrow morning, and after staying a short time in New York, I shall proceed to Europe, and there, before the great learned societies, exhibit my man without brains and gain immortality."

Here the door was reached, and opening it the Doctor ushered his visitor in. Carefully closing it behind them he led the way into an inside room, the door of which was locked, and at length the reporter was in the presence of the mystery. Lying stretched on the bed was the figure of a tall young man, whose closed eyes and slowly heaving chest showed him to be sleeping. No, at least, thought the reporter, and said as much, but Doctor Deranogozo only laughed and said, "Oh dear, no, that is his normal condition."

Approaching, the Doctor drew down a shawl which covered the lower portion of the young man's body, and asking the reporter to feel the well-filled limbs, said, "You see, he is by no means a skeleton." No movement was made of the body as the limbs were touched, nor had the brown, slightly bearded face altered one whit in its awful vacancy—not of expression, but of everything approaching it.

"And now," cried the Doctor with an air of triumph, "See where I, Manuel Pedro Deranogozo, have scooped out a man's brains as a monkey might scoop out a coconut." With this, while the reporter could not keep down a nervous shiver, the Doctor took off a black velvet cap from the unconscious, witless, brainless young man and displayed a glistening, ivory cover of oval form which fitted like a lid in Hansa's skull. Lifting it by a small ivory button, the anatomist took from the interior a quantity of soft lint, which he said was necessary to keep out the cold, raised the patient into a sitting posture and asked the reporter to "look in." What had been the seat of faculties, aspirations, was now only an empty sphere, which rattled like a box under the Doctor's finger-nails. A silver plate covered the bottom of the interior to protect the *medulla*

*oblongata*, but save for this, the skull was just like that to which it had been compared—a scooped-out coconut.

"Can he hear us?" asked the reporter almost in a whisper, as the cover was put back in its place.

"I am not sure," answered the Doctor, almost wearily, "nor am I certain whether he possesses any sensibility whatever. You see the fact is that my encroachments have gone so far that not only are the paths of association broken up, but the centres themselves of ideas also. When I feed him it is with the food rolled into pellets washed down by whatever liquor is handy; but except for the consequences of indigestion, I might just as well feed him with pebbles and ammoniac. I shout into his ear, or fire off a pistol to it, but I am not sure whether he hears, because he makes no motion of having heard. Still he may hear, yet have no idea of the impression caused. The question of the relation between sense and sensibility is here more than ever unsolved. I cover him with extra clothing because applying a thermometer to his body I find it marks only 60 degrees. After being covered his body heat is 79 degrees, but whether he feels that warmth I cannot say. I place camphor-oil under one nostril and asafetida under the other; but whether he smells both or either I do not know. I place him on his feet, and whilst he may walk forward, he is just as liable to fall down backward."

"Then, it seems to me," said the reporter hesitatingly, "that this man without brains is just as great a mystery as he was with brains."

Dr. Deranogozo remained silent a moment, and then said with the sad sigh of fallibility, "Sometimes I almost think the mystery has deepened."—*San Francisco Chronicle*.

#### DOUBLE ACROSTIC.

To all my friends I say once more  
"Good-bye" but only "au revoir."

1.  
"Have a cigar?"—"No thank you, Sir."  
"The 'weed' in this form I prefer."

2.  
The oldest Histories of this Land  
Are buried in its desert's sand.

3.  
A period of time: soon past  
An age at first—it dies at last.

4.  
By War's alarms be troubled never,  
Sweet sign of Peace—O! live for ever!

5.  
Does the wind blow wet and cold?  
Your compass take—the point's soon told.

6.  
When asked if you this light can guess,  
You can but make one answer—"yes."

7.  
A dance adapted to the frisky  
People addicted to Scotch whisky.

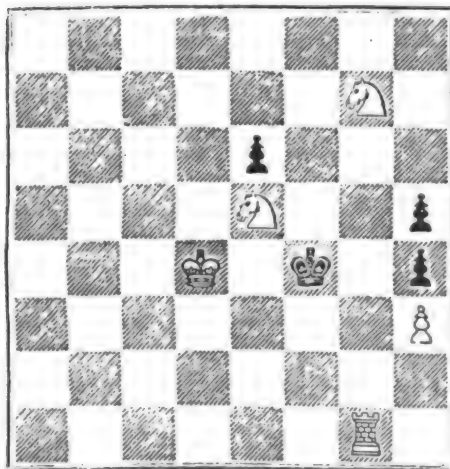

8.  
This final light may be a *horre*,  
But that is *all*—and nothing more.

#### METEOROLOGICAL REPORT

FOR WEEK BEGINNING FRIDAY, MAY 28TH, 1880.

Observatory of Daigaku, Moto-Fujicho, Hongō, Tokio, Japan.

#### REMARKS.

Heavy line represents barometer.  
Light continuous line—max. & min. thermometers.

.....represents velocity of wind  
.....percentage of humidity

Max. velocity of wind 15.5 miles per hour on Friday, at 1 p.m.

The barometer is reduced to the freezing point and to the level of the sea.

The highest reading of the barometer for the week was 30.020 inches on Friday at 7 a.m. and the lowest was 29.608 inches on Saturday, at 2 p.m. There was a steady fall in the barometer until the minimum was reached and there has been a steady rise since. The thermometer has accompanied the barometer in its movements: the maximum temperature having fallen from 78°.5 on Sunday to 61°.7 on Tuesday, and then rising after that. The total amount of rain during the week was 2.044 inches. During the corresponding week of last year, rain fell every day, the total amount being 4.408 inches.

#### SHIPPING INTELLIGENCE.

##### INWARDS.

- May 31. Russian corvette *Djigit*, Captain de Livron, 1,334 tons, 8 guns, 250 H. P., from Honolulu.
- May 31. French steamer *Tunais*, De la Marcelle, 1,735, from Hongkong, Mails and General, to M. M. Co.
- May 31. British steamer *Belgie*, Meyer, 2,627, from Hongkong, Mails and General, to O. & O. Co.
- May 31. Japanese steamer *Shiro Maru*, Kilgour, 524, from Kobe, Mails and General, to M. B. Co.
- June 1. Japanese steamer *Takachiho Maru*, Nye, 1,407, from Hakodate, Mails and General, to M. B. Co.
- June 3. Japanese steamer *Tokio Maru*, Swain, 1,146, from Shanghai and ports, Mails and General, to M. B. Co.
- June 4. Japanese barque *Samaura Maru*, Spiegelthal, 925, from Nagasaki, Coals, to M. B. Co.
- June 4. Japanese barque *Kinokuni Maru*, Nicolle, 960, from Nagasaki, Coals, to M. B. Co.
- June 5. Japanese steamer *Koruri Maru*, —, 810, from Kobe, Mails and General, to M. B. Co.

## PASSENGERS.

Per French steamer *Tunis* from Hongkong:—Col. Cauliffe, Messrs. Beaumont, Goulcur, Harris, Mr. and Mrs. Schüt and two children and Mr., Mrs. and Miss Robinson. 4 Chinese on deck.

Per British steamer *Belgie* from Hongkong:—Capt. C.A. Fletcher, and 1 Chinese for Yokohama; R. D. M. Kie, and 526 Chinese for San Francisco.

Per Japanese steamer *Takachiho Maru* from Hakodate:—Six Japanese.

Per Japanese steamer *Tokio Maru* from Shanghai and ports:—His Ex. Shotweger and wife, Mr. and Mrs. Musgrave, Mrs. Wakiyama, Mrs. Seki, Mrs. Nakayama, Miss Shervinton, Mrs. Wakiyama, Mr. and Mrs. Matsuka, Mrs. Seki, Messrs. Reid, Van der Polder, Von Fischer, Col. Shervington, J. Thomson, J. Johnson, Makiyama, Chikimitsu, Oaska, Idichi, Ogata, Mori, Seki, Kaga, and R. Davidson in cabin; 3 Europeans, 16 Chinese and 294 Japanese in steerage. For San Francisco: Mr. H. D. M. Ewan, U.S.N.; and 1 Chinese in steerage. For Liverpool: Rev. Canon Scott.

## OUTWARDS.

May 29, Japanese steamer *Samida Maru*, Hubenet, 896, for Hongkong via Kobe. Mails and General, despatched by M. B. Co.  
May 30, British ship *Clydebank*, Hatfield, 1,825, for Hongkong. General, despatched by Fraser & Co.  
May 30, German barque *Talor*, Stolze, 312, for Newchwang. General, despatched by Chinese.

May 30, Japanese steamer *Tokai Maru*, Hogg, 1,042, for Samusawa, Mails and General, despatched by M. B. Co.

May 30, Japanese steamer *Togoshima Maru*, Hubbard, 597, for Kobe, Mails and General, despatched by M. B. Co.

May 31, American Corvete *Ticonderoga*, Commodore Shufeldt, 2,220 tons, 11 guns, for Corea.

May 31, British steamer *Guy Mansergh*, Mann, 1,300 for Kobe, part of original cargo, despatched by Hudson & Co.

June 1, Japanese steamer *Hioyo Maru*, Thomas, 896, for Hakodate, Mails and General, despatched by M. B. Co.

June 2nd, British barque *Lord of the Isles*, Watt, 317, for Takao, despatched by Chinese.

June 2, Japanese steamer *Hiroshima Maru*, Haswell, 1,200, for Shanghai and ports, Mails and General, despatched by M. B. Co.

June 3, Japanese steamer *Wakamatsu Maru*, Christensen, 1,343 for Kobe, General, despatched by M. B. Co.

June 3, Japanese steamer *Kumamoto Maru*, Drummond, 1,204, for Samusawa, General, despatched by M. B. Co.

June 4, Japanese steamer *Sharin Maru*, Kilgour, 524, for Kobe, General, despatched by M. B. Co.

June 4, British steamer *Malacca*, Seaton, 1,709, for Hongkong, Mails and General, despatched by P. & O. Co.

June 5, British steamer *Belgie*, Meyer, 2,627, for San Francisco, Mails and General, despatched by O. & O. Co.

June 5, British steamer *Merionethshire*, Rickards, 1,204, for Kobe, General, despatched by Adamson, Bell & Co.

June 5, British steamer *Radnorshire*, Davis, 1,201, for New York via Kobe and Amoy, Ton, despatched by Adamson, Bell & Co.

June 5, American ship *Charles Dennis*, Carney, 1,710, for Manila, Ballast, despatched by C. J. Trading Co.

## PASSENGERS.

Per Japanese steamer *Samida Maru* for Hongkong via Kobe:—Mrs. Okuhara and son, Messrs. T. Winckler, Hori, Fukuma, H. W. Hagart, E. C. Kirby, and Kohayashi.

Per Japanese steamer *Hiroshima Maru* for Shanghai and ports:—Mr. and Mrs. Funasawa and 2 children, Rev. and Mrs. T. C. Carter, Mrs. Gordon, Miss J. Roberts, Messrs. Ban, Osumi, Nagayo, Nabeshima, A. de Silveira, J. Sharp, Nagawa, Miura, Fukasawa, R. D. Robinson, E. Hogg, Kusaa, Matsui, Minato, J. Mahon, and Fujita.

Per British steamer *Malacca* for Hongkong:—3 Europeans, 1 Japanese and 1 Chinese in steerage.

Per British steamer *Belgie* for San Francisco:—For Liverpool: Miss Shirvinton, Revd. Canon Scott, Col. Shirvinton. For Paris: Mr. L. Wertleimber. For London: Mr. Platt. For Hamburg: Mr. T. L. Nielsen. For San Francisco: Mrs. Marshall, Messrs. H. D. McEwan, R. D. McKie, H. Ripley, W. L. Todd, U.S.N., Captain and Mrs. Bridges, Mr. F. J. Thomas, Mr. and Mrs. Quintin Hogg, and servants in cabin; 2 Europeans in steerage.

## REPORTS.

The British steamer *Belgie* reports: Left Hongkong on the 25th May at 3.51 p.m., encountered light N.E. winds and fine clear weather throughout the voyage. Off Murato Saki, May 30th, passed the three masted schooner *Laura R. Burnham*, bound to the S.W. Off Rock Island, May 31st, passed British barque *Flecher* bound South. Arrived May, 31st at 4.35 p.m. Time, 5 days 23 hours 5 min.

The Japanese steamer *Takachiho Maru* reports: Left Hakodate on the 30th of May at 6 a.m. Experienced variable winds and dirty rainy weather throughout the entire passage. Arrived at Yokohama 1st June.

## PROGRESSIVE CONSTITUTIONALISM.

A TOKIO contributor to the *Times* has furnished some information on the subject of the deliberations of the Assembly of the Governors of cities and prefectures held in Tokio in February last—information which, we believe, has not yet been made public in the columns of the local press. Under any circumstances, however, reference to the subject is interesting at present, when a purely factitious agitation, for a constitutional assembly in its fullest sense, created by a parcel of interested agitators, is hardly allowed to subside, being kept from utter collapse by the spasmodic and incoherent effort of a few of its originators. It is useful, we say, under these circumstances, to consider to what extent the organization of the provincial parliaments which the Governors represent in their central gathering, has proved successful, and how it has been found necessary to remodel them.

In May, 1878, it was decided to try the experiment of giving a measure of representation in local matters to the inhabitants of the various provinces. The provisions of the bill then passed by the senate were printed in the *Japan Times* of the 1st of the following month, with comments by the late conductor of that review. The views then enunciated are in the main true to-day, so far as regards the eligibility of Japan for the possession of the complete privilege claimed by pseudo progressists is concerned. The writer held that the convocation of the *Chihō-Kwan Kwaigi*, or general assembly of provincial Governors, though falling far short of what a parliament was meant to be, seemed to be "practically as long a step towards its fulfilment as could be taken safely, in the existing state of Japan's political infancy; and this, the most important of

the three bills presented to them for discussion is the most creditable to its authors, the lamented Okubo and his friend Ito." The measure referred to, the constitution of the country municipal councils, or parliaments, was returned by the Governors in Council to the Government with only one material alteration, namely, one made on the side of conservatism,—a limitation of the franchise. In its perfected form it was well described, as "a proof of the wish of its framers to temper and to ameliorate the despotic system, but, at the same time, of a wise recognition of the necessity of educating the people, to fit them for the reception of larger boons of liberty." It was added that the people were then entrusted with as much power and freedom of discussion as they appeared to be fitted for, and the hope was expressed that good use would be made of the privileges conferred. The recent extension of these appears to prove that the hope was justified.

All the suggestions offered by the Supreme Government to the assembled Governors in the early part of this year, of course, and naturally, related to matters of local administration. When the people of the entire empire are consulted about imperial measures, it will not be through their local rulers, but through their own elected representatives, who will then constitute a "parliament" in the sense in which Englishmen understand the word. For this advanced institution the nation is being gradually, and we trust effectually, trained. That some progress towards it has been made must, we repeat, be admitted; but the final concession must yet be remote.

The principal improvements which it was found possible to effect at the commencement of this year, in the constitution of the local representative assembly of each city and prefecture, are thus enumerated in the *Times*:—1. Hitherto local assemblies had no recognised privilege of criticising the local expenditure of the last financial year, a report of which was simply presented to each assembly by the Governor. Now, however, if any irregularity is found in these reports, the assembly has the power, after discussion, of making a representation, through its Speaker, to the ministers of the Home and Finance Departments. 2. The speakers of the local assemblies, who are elected by the members from among their number, had hitherto to be recognised by the Governor. Now, however, it is only necessary that the names of those chosen should be notified to the Governor and the Home Department. 3. The assemblies are empowered to interrogate any member who fails to attend the sitting when summoned, or neglects his duty without reasonable excuse, and to dismiss him; and such members, when dismissed, are disqualified for re-election, and also lose their privilege of voting for four years. 4. Resignations and petitions for leave of absence, which hitherto had to be presented to the Governor, are now to be submitted to the Speaker of the assembly. Several other propositions, relating to the ways and means of local taxation, and motions to regulate communal organisation and management were passed. Among these

we find a clause that small islands, to which the general local system would not be applicable, may be regulated by one different from the mainland to which they belong by consent of the Central Government. Of these four concessions, the most important, the most vital, the one which most distinctly indicates that the limited power previously exercised by the councils has been so applied as to warrant a further extension, is that which confers on them the right of control over the local revenues. To quote once more the utterance of the *Japan Times* two years ago: "The municipal budget shall be discussed and adopted by the Council, subject to the Governor's approval. . . . the Governor shall, at the beginning of each ordinary meeting, produce the accounts of the preceding year. But it does not appear clearly with whom—Governor or Council—lies the power of initiating proposals for local taxation. This of course is the most important part of the whole scheme. Power over the national purse once entrusted to the people, the other privileges of constitutional freedom must follow, and only the question of time remains for patience to solve."

Other measures, notably those connected with local relief are, according to the correspondent, to be brought within the control of the provincial councils, by which funds will be provided from a small extra percentage of the land-tax. The scheme for the application of the fund is benevolently devised, and its details are also to be regulated by the assemblies. Its provisions are as follow: 1. To give food for thirty days to those who have none, and to give money to rebuild their cottages destroyed by calamity, not more, however, than 10 yen to each family; and to supply, when necessary, seed and implements of husbandry, not more than 20 yen to one family. 2. Also to advance money for them to pay their tax when they are unable to do so without selling their land and dwelling. When in any province the money required for such relief exceeds two-thirds of the annual saving, the Home and Finance Ministers, on the petition of the Governor, are empowered to advance out of the Central Fund the necessary amount. Large towns, like Tokio, are to be permitted by the Government, on the petition of their representative assembly, to raise and administer their own relief fund, according to their own views. The accounts and state of this fund, income and expenditure, are to be reported yearly or half-yearly to the Home and Finance Office, to be examined by the Minister of the latter, and the result published. This system is to come into operation on the 1st of January, 1881, and to be in force for twenty years. After this period the means of maintaining the system will be discussed and settled by the representative assembly of each locality." In the interval which will elapse, the nation, or rather its artisans and peasants, its shopkeepers and farmers, may come to know what the benefits of the franchise and of representative government really mean, and to appreciate their possession. Meanwhile it is evident that the present Government is prepared to redeem, in due course, all pledges given, and is working honestly, and none the less steadfastly, because tentatively and with precaution, towards the end which it purposes to attain.

#### THE NIPPON RACE CLUB.

IF we were to say that the light of other days had revisited our race-course, and that the community had been infused during the recent meeting with the spirit of the past, we might correctly describe the real truth. That Yokohama has had an enjoyable spring meeting: that there has been an interest in it beyond any that has

been known for years: that it was highly successful in every essential, is a fact that cannot be called in question. But much of the interest has arisen from circumstances as novel as they are gratifying.

We will not dwell upon the errors of the past, further than to remark that they point a moral which all may understand. They teach us that, in a community like this, it is hopeless attempting to produce great results by means of ingredients that will not mix; and that the first element of success is unanimity of purpose. Gentlemen looking for a recreation—an amusement—outside business hours and avocations, may find in the excitement of training, the early-rising, the changing effects of care and education upon the ponies, an agreeable pastime, leading to a grand development of their physical health and strength; bringing them into constant contact and communication with men of their own level, whose tastes assimilate with theirs; and giving them an object to engage their attention, and remove the terrible monotony of their exile. The stakes, the moderate betting, the lotteries, may all be valuable aids to give a fillip to their energies. But, whatever racing may be or lead to elsewhere, to attempt to introduce a system by which professionals can be placed on equal terms with the mere pleasure-seekers must prove a failure. Theory asserts it; practice has demonstrated it.

Happily the failure of the attempt was so thorough as to leave no doubt as to its cause, and to sweep away utterly and entirely every portion of the whole fabric, so that there was no possibility of its resuscitation. Thus was a clearance made for a new departure. Gentlemen whose tastes lie in this direction have taken the matter in hand; and we need hardly say how heartily we congratulate them on the success of their efforts as seen in the three days' racing we have recently witnessed.

The point of our article, however, would be lost did we leave the subject here. Our object is very different. It is to bring to the public notice the real advantage to be gained by the country at large through the course that has been taken in establishing the Nippon Race Club. It is no longer a purely foreign institution, to which Japanese gentlemen can find admission by courtesy. It is an institution largely joined in and supported by Japanese from the first. When we see Princes of the blood, Ministers of state, *kuazoku*, and many important *shizoku*, among its earliest members; when we find them entering their ponies for competition in the true spirit of gentlemen seeking a pastime; when we observe, on the list of prizes, a cup presented by the Foreign Office, and vases graciously sent to the Secretary by the Mikado; we feel impelled to believe that this is strong evidence of the kindly feeling entertained in high quarters towards foreigners, and to call upon our fellow-sojourners to receive it as such, and to respond to it by a hearty reciprocation.

But another thing we have to observe is the advantage that the country at large may derive from this awakened interest in the breed and training of ponies. It was a general remark at the recent meeting, how beautiful in symmetry, and in what admirable condition, were some of those entered by Japanese; whilst the perfection of some of the half-breds has often been the theme of conversation. The fact that Mr. Matsukata, the Home Minister, and, we believe, General Saigo, have been successful competitors at the recent meeting, gives a satisfaction which is intensified when we see that they have gone into racing *con amore*. Mr. Matsukata has his own views concerning the breeding and training of horses; and he is inclined to give the native method a fair and watchful trial,

that he may ascertain for himself whether or not the foreign modes are superior.

This is just what is requisite;—that gentlemen of means, whose position places opportunities within their reach, shall make independent experiment. For our part, we do not pretend to know anything whatever about the respective differences. All we rejoiced to see, is, that there are, among the Japanese gentry themselves, some who have this interesting bias, and are determined to carry the investigations to the furthest possible extent. Mr. Matsukata will not long be solitary in his investigation and experiments; and we have, in this newly generated spirit, a guarantee of permanent and cordial coöperation with the foreign supporters of the Club. That the interest now awakened among the Japanese is not confined to those who have enrolled themselves members of the Club, is seen in the fact that His Majesty has been witnessing in Fukiage Park a competition between a foreign horse and one of Tosa breed. It is to be supposed that the latter must be something very superior; and it would be useful to know the particulars connected with the trial.

It will, doubtless, now become a matter of inquiry as to the best horse-breeding district; and probably we may begin to hear of pedigrees and rare blood.

Hitherto, no effort has been made to preserve the line of ponies that have done great things in their day: old *Bata-rier*, and *Samurai* for instance. We hear that *Typhoon* has been sent to the stud; but there is, as far as we know, no descendant of any of those mentioned to keep up the ancestral honours; and yet they are worthy of it. In China, it may be comprehensible that no efforts are made to preserve the family line. Racing there is confined to foreigners who are even more birds of passage that are their countrymen here; but even in Japan it need not be wondered at that foreigners have not laid themselves out to encourage careful breeding. But the circumstances of the present time lead us to hope that the Japanese will now pay attention to it; and in years not far distant we may hear of ponies, whose performances will be followed by all the attentive watchfulness that the name and fame of their lives will provoke. It would be a happy memory of the birth of the Nippon Race Club, were it connected with the fact that, with it, commenced the first pages of the Nippon Stud-book.

This is a matter worthy of consideration of the gentlemen who are so pleasantly amalgamated with the Japanese in the formation of the Club; and who have seen their first labours crowned with success. They may easily, by striking the iron while it is hot, and pointing out the uses—the real value—of a Stud-book, lead their native friends to systematize their racing tastes, and find greater interest in seeing the results of their stud-breeding than in merely selecting a few ponies at hap-hazard about whom nobody knows anything, and nobody cares. Another hint may also be useful. As soon as judicious horse-breeding has assumed sufficient development, it would be well to offer, periodically at public auction, batches of ponies, in the same manner as is done elsewhere, so as to stimulate a desire among those who can afford to keep horses for any purpose to have the best of the kind available.

We trust that our suggestions may fall upon good ground and bear fruit. Meanwhile, we can honestly, on the part of the community, acknowledge the good service done to Yokohama and Tokio, by the promotion of the Nippon Race Club.

#### THE REPUBLICAN NOMINATION.

IN another part of this journal we publish, from a trustworthy pen, a full account of the life of General James A. Garfield, the nominee of the Republican party in the United States for the next presidency. It will be seen that his record is a brilliant one, and that he is yet in the prime of life. His nomination has been received with great favour by his countrymen in this vicinity. His most distinguished competitors on the same platform were the illustrious General Grant, Mr. John Sherman, Secretary of the Treasury, and Mr. James G. Blaine, United States Senator from Maine, the same who contested the nomination of his party unsuccessfully against Mr. R. B. Hayes, the present President, four years ago. The three rivals mentioned were the most prominent on the list of their party, and their respective forces on the committee were not far from equal.

The two names next in weight, mentioned as candidates in the event of the withdrawal of either of the two first, were Mr. E. B. Washburne, formerly United States Minister in France, and the politician who is now said to have been selected by his party to compete for Presidential honours. He has long been one of the republican leaders in the house of representatives, where he was sent from Ohio, by which state he was also lately chosen Senator. Of course nothing is known of the actual circumstances under which the nomination was arrived at; but there is every reason to suppose that it was the result of a combination between the friends of Messrs. Sherman and Blaine.

The democratic convention will meet at Cincinnati on the 22nd instant, and the result of their proceedings should be known early next month.

TOUCHING on the subject of a recent article in this review, entitled "An Ancient Burial Custom," we may refer to a paper read on the 13th of April, before the Anthropological Institute of London, on "Fijian Burial Customs." It seems from the report in the *Athenæum* that the practice of strangling widows that they might be buried with their dead husband is common to every Fijian tribe. The widow's brother performs the sacrifice, and is thenceforward treated with marked respect by his brother-in-law's kinsfolk, who present him with a piece of land, over which the strangling cord is hung. The victim is made to kneel down, and the cord is put about her neck. She is then told to expel her breath as long as possible, and when she can endure no longer to stretch out her hand as a signal, the cord is tightened, and soon all is over. Since writing the article above referred to, we have had the advantage of perusing a paper by the late Mr. Mayers, "On the stone figures at Chinese tombs, and the offer of living sacrifices," contributed to the North China branch of the Royal Asiatic Society. From this it seems quite evident that in ancient times human immolations were the usual accompaniment to the obsequies of monarchs. Thus in B. C. 678 it is recorded that sixty-six persons followed the Emperor Wu Kung in death; again in B. C. 621 the fate of a grandson of the same monarch was shared by one hundred and seventy-seven persons. "One more instance, but this the most celebrated and the most circumstantially narrated, of all in connection with the practice of human immolation by the sovereigns of the Ts'in dynasty, remains to be dealt with. On the death of the mighty conqueror She Hwang-ti, in B. C. 210, his son and successor caused, it is related, his interment to be effected in a great cavern artificially hollowed out of the depths of the Li Shan in Shensi, which the Hwang-ti had prepared during his lifetime as the resting place of his remains. According to the

record preserved by Sze-ma Ts'ien, an army of more than 70,000 labourers, gathered from all parts of the Empire, was employed in excavating the bowels of the earth at this spot, down to three-fold depth; and in the heart of the cavern thus formed palatial edifices were constructed, with positions duly allotted to each rank of the official hierarchy, and these buildings were filled with marvellous inventions and rare treasures of every kind . . . . The young Emperor said :—“ It behoves not that those of my father's female consorts who have borne no children should go forth into the world ; ” and he required of them, hereupon, that they should follow the dead Emperor to the tomb. The number of those who consequently went to death was very great. When the remains had been placed beneath the ground, it chanced that some one said :—“ The artificers know all that has been done, and the secret of the treasure will be noised abroad. ” When the great ceremony was over, the central gate of the avenue of approach having already been closed, the lower gate was shut, and the artificers came out no more. Trees and herbage were planted over the spot, to give it the appearance of an ordinary mountain.”

**E**UROPEAN discussion on the relations between the Russian and Chinese empires is, on the whole, assuming a more and more decorous and rational, and perhaps less consummately uninformed aspect than it previously wore. The London *Economist* contains the following remarks :

The probability of such a war is perhaps not very great. Nevertheless, there can be no doubt that the Chinese Government, under some impulse not yet clearly perceptible to Europe, has for some years past deliberately continued making war—has made it, in fact, as a settled policy rather than for any temporary reason. This looks very much as if there was a settled policy of war to be carried out steadily, even if it should involve the possibility of another contest with Russia. It is very difficult to believe that the Chinese statesmen now in power, who are accustomed to manage very great affairs, would have claimed Kuldja, or menaced Kuldja, unless they meant to fight for it, and equally difficult to believe that, when they repudiated their ambassador's treaty, and insisted on better terms, they were not really to go to war in the event of a refusal. With Russia in the field, however, the interest of Europe, and especially of England, in such a war becomes very keen. The temptation on Russia to operate from the East, to use her fleet to blockade Chinese ports, and, if possible, to urge the Japanese to a descent on Chinese territory, is very great indeed. The Government of St. Petersburg would be sure to take that course, and if it did take it the whole foreign trade of China might be stopped or thrown out of its ordinary channels, to the great embarrassment of the Indian Treasury, which might be compelled to ask for English assistance. Even apart, therefore, from the great repugnance with which this country would witness such a war, the direct interest of England would lie in preventing any formal breach. Still there is no certainty that the warlike group of statesmen in Peking will be defeated, or a policy abandoned which has been very considerably adopted.

**T**HE latest report of the Foochow Chamber of Commerce shows the reluctance that is inherent in Chinese to abandon the vicious habit of adulterating their goods, a practice which, in the case of tea at least, has done much towards injuring the trade of the country. This matter deserves some notice here, especially in view of the recent attempts which have been detected in Hiogo to mix fraudulent matter with the genuine leaf, and other endeavours at less gross falsification which are said to have been exposed during the past week or two in this immediate neighborhood. We read that Her Majesty's Consul was urged by the Chamber to represent to the native authorities the necessity of maintaining the old standard of Oolong tea. “ It was shown that owing to careless preparation, and great admixture of dust, the

trade in this description of tea had gradually declined, and that though some improvement had been noticeable of late, and the teas were again coming into favour in the United States, it could not be too forcibly impressed upon the native dealers that if a continuance of foreign patronage was desired, the former high standard of quality must be kept in view. To this appeal the Chinese authorities also promised attention.” There is a striking similarity between the instance here mentioned and some which are reported to have occurred in the Yokohama tea-market. On the subject of spurious teas, the representatives of the foreign merchants at Foochow state that :—

Positive and reliable information having been received in April, from a foreign resident, as to the purchase—for transmission to this port—of wild tea and willow leaves in the adjacent district of Yuenfuh, your Committee lost no time in communicating with Her Majesty's Consul on the subject, requesting that he would be good enough to call upon the Chinese authorities to prohibit this unlawful traffic. As ample proof of the malpractice was furnished, as well as the names of the places where both the picking and the bags of collected leaf were seen, your Committee felt that no great difficulty should be experienced by the native officials in effecting a seizure of this spurious leaf. It was accordingly suggested to Her Majesty's Consul that the summary confiscation of the leaf, and punishment of the traffickers therein, would be the most effective mode of dealing with these fraudulent attempts to deceive foreign buyers. It now only remains to be seen whether this practical suggestion will meet with the concurrence of the authorities—who have meantime expressed their willingness to put a stop to these dishonest practices by means of proclamation.

**A**TTEMPTS made at Foochow on the part of the British Consul to secure the action of the native authorities in various fraudulent practices indulged in by the Chinese tea-growers, have met with some measure of success. The Committee of the Chamber of Commerce requested the Consul to take notice of the increasing faultiness of the packages in which teas are brought from the interior, a complaint which, as we have heard, might perhaps find an echo not many miles from here. The mercantile association wrote thus :—“ Your Committee early in the present year deemed it expedient to address a remonstrance on the subject to Her Majesty's Consul. It was pointed out that, while in former seasons the weights of the leaden linings of chests, half-chests, and boxes, were respectively 5, 3, and 1, to 1½ catty, the average of last season was only 3½ to 3¾, 2 to 2½, and 1½ catty. At the same time the fact was emphasised that this system of negligent packing entailed much waste of time and inconvenience to buyers as well as considerable pecuniary loss to tea-men ; while it undoubtedly tended to a decline of reputation in the different foreign markets. The Consul was asked to use his influence with the native authorities in correcting the abuses complained of.” The remonstrance was productive of good effect. A reply was received from Her Majesty's Consul, covering a despatch from the Chinese Superintendent of Foreign Trade, in which it was stated that measures would be taken to put a stop to the abuses in question, and that to this end instructions would be issued to the Prefects of the various districts whence tea is sent, as well as to the Marine Sub-Prefect, to take action accordingly.

**T**HE condition of the mail service of Great Britain, once one of the most perfect of modern institutions, is now, as far as its eastern ramifications are concerned, eminently unsatisfactory. Even the accessible ports of the Mediterranean, Gibraltar and Malta, have evident reason in their loud complaints. Here, in the extreme east, we have con-

stantly recurring evidence of the hap-hazard character of the service; and in the ports of China matters are hardly more regular. Foochow comes now to swell the general chorus of lamentation. A resolution passed by the Chamber of Commerce there is to the effect that the members, "being of opinion that the present postal service between this port and Europe, via Hongkong, is not only carried on in an inconvenient manner, and one which in the event of the total loss of a steamer carrying duplicate mails, as is now frequently the case, threatens the community with very serious loss, but is also totally inadequate to the requirements of this port; it is resolved that a memorial to the Post-Master General in London be drawn up, representing the present position of affairs, and asking that a local service, to consist of the weekly dispatch of one steamer from each end of the line, be organized between this port and Hongkong by means of a subsidy from the General Post Office in London." We are, to say the least, doubtful whether the request will meet with any consideration. However, a local committee was appointed to draw up the document decided upon, and it was further agreed, without a dissentient voice, that the said Committee should be authorized, on behalf of the Chamber, to "enter into correspondence with the Chamber of Commerce at Hongkong and Amoy, and with the residents at the Ports of Foochow, and Swatow, with a view to securing their assistance, by means of a joint or separate memorial on the same subject, in obtaining a subsidy for the maintenance of a regular and reliable postal service for the coast ports and Formosa." One might think that India at least should be well served in the matter of her mail communication. Yet even there, in spite of the fact that a liberal subsidy is granted to a certain company, the reverse is the case. The exponents of public opinion in the principal ports of the empire contain frequent but apparently fruitless remonstrances; so that those who are in direct mail relations with Europe, are only relatively better off than those who are dependent for their correspondence upon casual steamers.

**C**OMPLAINTS of the carelessness of Reuter's Telegraphic Agency are heard from all quarters. Here in Japan the shortcomings of this medium of communication have been animadverted upon time and again, the only apparent result being the occasional transmission of an uninteresting or obsolete message, in addition to the usual meagre information afforded. Similar complaints are not unusual even in Europe, as we notice in a recent English journal the following remonstrance:—

Really the agents of Baron Reuter should be more careful. Last week, a Reuter's telegram announced that the King of Sweden had sent for Count Arrid to form a new Ministry. Who this Count Arrid could be, I could not understand, for I had never heard of such a statesman in Stockholm. It turns out that Arrid is a Christian name, and that Count Arrid Posse was called upon by the King to form a Ministry. This Count Posse is a man who first made himself remarkable by his opposition to the Conservative Party in Sweden. He has, however, latterly, as President of the Second Chamber, managed to gain the favour of the King, and is now the head of the *Landmann* party; that is to say, the party of the landed proprietors. He is now President of the Ministers, and interim Minister of Foreign Affairs; to this latter office either Baron Hoeschli, the Swedish Minister in London, or Baron Bildt, who is Swedish Minister at Berlin, will probably be eventually appointed.

**N**OT many weeks ago the public heard of a contemplated alliance between Great Britain and Persia under which the latter power would take possession of Herat, and hold that coveted fortress in the interests of England. This announcement excited much comment at the time, as it was

stated that the Shah of Persia was about to march on Herat under the pretence of a royal pilgrimage to Meshed. The project, however, fell through, and the Teheran correspondent of a contemporary gives an amusing description of the motives which induced an abandonment of the enterprise by Persia. After detailing the preliminaries he goes on to say:—"The Austrian-drilled troops, the Cossacks, the new artillery, all were to go. In the meantime, it is true, the Austrian-drilled troops were hardly numerous enough; while, though the Cossacks had begun to learn how to ride, they were not yet efficient in drawing their swords or shooting with their rifles. The artillery, too, was without horses; but to the Persian mind these were very trifling difficulties. The expedition was decided upon. Some European officers prepared for the march; and a sort of hopeful content was visible on the faces of the English here. But when we studied the Russian physiognomy as presented at Teheran we noticed the same look of contentment, heightened by some little triumphant wrinkles round the eyes. A few days later we were able to account for these wrinkles. A great Cabinet Council had been held, and there, after many pros and cons, it was decided by a great majority not to march. The reasons assigned were not bad ones. First, there was the want of money; the equipment of, say, 20,000 men would be no joke; of the troops who would remain in possession of Herat (supposing the place taken) 10,000 at least would have to be paid more regularly than at home; and, since they must eat, food also would have to be provided for them." The correspondent also mentions some characteristic anecdotes of the author of the famous diary which was published after the visit of His Iranian Majesty to Europe:—"Political affairs being for the *Teheran Gazette* taboo, we have in the last number a long account of how the Shah went leopard shooting. Of all shikar episodes this is the most ridiculous ever heard of. One of the leopards was held by the tail by one man, and had a log of wood pushed down his throat by another: then he died. All the leaps and bounds of the leopards (there were two or three of them), the different shots fired—small shot, buckshot, bullets—all are accurately and minutely enumerated. Herat, Merv, Russia, England—all passed into dreamland under the excitement of the sport. Some weeks ago his Majesty visited the new Cossack barracks. The customary salt and bread were offered by the Russian Polkovnik and his wife. The Shah inspected the stables, the dormitories, the kitchen, store-rooms, &c. He was very much pleased at all he saw, and repeatedly said, 'Tazeghi dars!' (it is novel). This struck him particularly when he saw the bedsteads—huge, rickety, wooden cupboards holding three beds, which are let down at night and put up into the cupboard during the day. At the bottom of each cupboard is a box for straw and barley. At the back of the interior, and jammed up against the bed, are the clothes of the men. The width of the three beds is about six feet. Every bed has a mattress, a diminutive pillow, and a quilt. Truly it was 'tazeghi.' The Polkovnik proudly said, 'There's nothing like it in Europe.' We believe him. The rifles are of the Berdan pattern: the men have not yet had any practice with them."

**N**O question of greater importance to mercantile interests than the recent alterations in the regulations affecting telegraphic code messages has arisen for a very considerable time. These regulations are, as is pretty generally known, the result of the deliberations of an international telegraphic conference which meets every five years, the last having been held in London last year. This conference is composed of representatives of the various states through which the telegraph wires pass, but no representative of the mercantile

interest—the class upon which the maintenance of the lines in many instances altogether depends—had a seat in the assemblage. As has been pointed out the principal alteration in the new rules—now binding for a period of five years—is that which prohibits the use of proper names. The ground of the objection to such words has never been clearly stated, save that this class of names leads to the coining of words which do not exist in any dictionary. It now only remains for the public and the companies alike to abide by the regulations now framed for their mutual guidance. In the application of the new rules, however, there is abundant latitude for very divergent interpretations, and the smoothness of their working will largely depend upon the judgment of the officials controlling them. The regulation which excludes proper names does not specially state that words founded upon them are not admissible, but the companies have announced that they will so interpret this rule. Thus, as an exchange remarks, “the word ‘Spain’ is excluded because it is a proper name; but the word ‘Spanish’ will also be refused, apparently for no good reason, as it is not a proper name. We apprehend that the companies are bound by the same set of rules as the public, and they will not find it to their interest to enforce a one-sided interpretation against the class from which the telegraph lines derive their main support. Again, there is a large class of words having a double meaning, one of which would bring them under the rule in question, while the other would not. Thus the words ‘Cork’ or ‘Orange’ might be rejected by a keen telegraphic official as inadmissible on account of their being cities in Ireland and France respectively, while the sender of the message uses them in the sense of their being vegetable productions. ‘Glazier,’ again, is a common family name, and is therefore excluded, but used as the name of a trade it is a word that must be allowed. Similar instances might be multiplied. From inquiries which have been made at the General Post Office, London, it seems that such words as ‘Thomsonite,’ though named after a person, will be allowed under the regulations, since it is a word used in a generic sense applicable to a certain mineral. In the same sense the common flower ‘narcissus,’ though occurring as a proper name in heathen mythology, is an admissible word; so with *fuchsia*, *lobelia*, &c., founded to commemorate the old botanists Fuchs and l’Obel, these being plants which in their various forms belong to the languages of Europe and have a common signification. To limit the meanings of such words by including them as proper names would appear to be a straining of the regulations, and one which merchants may find it necessary to combine against.”

WE are pleased to notice that Professor Morse has taken up the cudgels in his own defence against Mr. Dickens’ strictures on his monograph on the Onori shell mounds. A recent number of *Nature* contains a note from Mr. Darwin, enclosing a somewhat trenchant reply from Professor Morse. Mr. Darwin thought that the criticism did “very scant justice” to the work, and Professor Morse points out in almost every case the identical errors to which we referred in our note on the subject. In the following passage, we beg to say that the term “ordinary Briton in Japan” may with full justice be extended to “ordinary foreigner in Japan” :—

Finally, his (Mr. Dickens’s) ungenerous complaint of my well-merited compliment to the Japanese printers and binders who made the pamphlet, illustrates a lamentable but too common trait of the ordinary Briton in Japan, namely, that which manifests itself in a childish delight at the failures of the Japanese, and in sneers at their successes.”

#### THE ASIATIC SOCIETY OF JAPAN.

ALTHOUGH the present volume of the Transactions of the Asiatic Society of Japan contains fewer papers than usual of general interest, it has several which are of permanent value. It is in fact a “heavy” number: but this term, somewhat derogatory when applied to newspapers, is not unfrequently one of praise when referring to the proceedings of a learned society. To the volume is prefixed a map of the castle of Yedo, which should have accompanied Mr. McClatchie’s paper on that subject in a previous issue; but the author seems to have been unable to produce it at the time. As a key to the written contribution it is indispensable, but would be more generally useful if, as might have been done in many cases, the figures had been replaced by printed names. With a little more trouble the map might have been made to speak for itself.

The “Land Provisions of the Taiho Rio,” by Mr. Tarring, shows a remarkable progress made by the Japanese at the time when this code was drawn up, namely, as early as the beginning of the eighth century of our era. It consists of thirty chapters, of which the present paper gives only one with brief references to two others. The code deals chiefly with the various modes of dividing, proportioning and disposing of the land, and an enumeration of the contingencies under which it lapsed into the hands of the Emperor.

It is curious to notice that more than five centuries before the English made their statute of mortmain, by which all lands granted to the Church without the King’s license were declared forfeited, the Japanese found it necessary to prohibit, by this code, the gift or sale of land to a temple. It is probable that the overweening ambition of ecclesiastics was the cause of such a provision in Japan as well as in England.

In the next contribution Dr. Edkins, of Peking, endeavours to shew that the letters *chi* and *ten* of the *kana* syllabary have changed in the course of time into their present form from the earlier forms of *ti* and *tu*. Mr. Satow takes up the gauntlet and contests this position. The subject in question is one of interest only to a few philologists.

The *pièce de résistance* of this volume is undoubtedly the paper on the birds of Japan, contributed jointly by Messrs. Blackiston and Pryer. It is chiefly a catalogue in which an attempt is made to furnish, as far as possible, the scientific, Japanese and English names of each specimen, and to point out the museum or other institution in which they may be examined. The paper occupies about seventy pages of the number, and probably represents the results of ten or twelve years of work. Captain Blackiston was at great trouble to make a most careful collection of the different species of the country, and, we believe, eventually presented a valuable collection of birds, representing twenty years of labour, to the Kaitakushi department for its museum at Hakodate. Considering then the amount of research evinced by this contribution, it is with much regret we notice, that the authors have adopted a system of transliteration in their work, which seriously impairs its value to that portion of the scientific world, or the general public, most interested in ornithology. A foreign scientist coming to study the subject in Japan would naturally first ask what had already been done here. He would be referred to the paper under review, and would ultimately find that half the Japanese names were unintelligible and useless to him, as the eccentric and even erratic mode of spelling adopted, rendered it hopeless to pronounce them in a manner comprehensible to native guides or interpreters. He will then be compelled either to spend some time in acquiring the mysteries of Japanese *kana*, and a conventional and most questionable mode of reproducing them into English, or will have to relinquish, in many cases, the assistance of this otherwise valuable work. To take but one example from many, let us be allowed to ask how many residents, or what stranger, can tell where *Nitsukuan* is? We shall leave our readers to exercise their minds on this topic, premising that it is a place well-known, by name at least, to every one in Japan, but almost totally unrecognisable in this eccentric form. The authors are not even consistent with themselves; for on page 173 we find “Ken-iku-Haku-butsu-kuwan” and further on we find the same institution referred to as the “Kiyoo-iku-haku butsu kuwan, museum.” *En passant* it might be observed that the addition of the word “museum” in the last instance would seem a very unnecessary and unreasonable kind of tautology.

Again, what is “Nitsu-kuwan,” on page 184, appears as

"Nitsun-kuan" on page 211. The truth seems to be that the authors, or whoever may be responsible for the editing of this otherwise valuable work, have no correct knowledge of the mode of spelling in *kana*, like indeed most Japanese themselves; and are quite content if they can produce common well-known names in a puzzling and fantastic manner. We cannot help thinking that one of the authors, who left the country some months since, will be sadly grieved to find that his work has been rendered so comparatively useless by these curious freaks of editorship. It is with no feeling of pleasure that we dwell on the faults rather than the excellences of this paper; but the former are so glaring, and might so easily have been avoided, that we cannot help referring to them.

We have already dealt sufficiently in previous reviews, with Mr. Dickens's system of *kana* transliteration, but we may here refer to the writer's statement of political views in this last effusion. This occurs in the note on page 246. We mention these views not so much for their intrinsic merit as for the novelty of seeing them published in the proceedings of the Asiatic Society. The philosopher of the Temple informs us from the other side of the globe that "the Government of this country appears to him to be drifting more and more into the hands of a set of bureaucratic oligarchs." We will not discuss with Mr. Dickens whether the future rulers of Japan will attain the alarming condition suggested by his long French adjective and uncouth Greek substantive, or not. We venture to think, however, that the channel for conveying his prophetic speculations to the world is not the most suitable one possible. We had understood that politics were carefully eschewed in all associations having kindred objects with the Asiatic Society of Japan; and it is difficult to see why an exception should have been made on this occasion.

Next in order follows a paper contributed by Mr. Atkinson, shewing the results of analyses of Japanese porcelain clays.

Mr. Chamberlain's "Short Memoir from the Seventeenth Century" is a charming little piece of pretty writing. Being, as the contributor observes, no mere dry record of facts like most Japanese histories, nor a collection of tedious sentiments such as many translations shew, it lifts the veil of artificial obscurity and gives us a refreshing peep into Japanese domestic life, with all its little joys and trials. As a rule we have few revelations of the "home life" of past days in Japan. We read of the tyrannies of men, the wars, the long cherished revenges kept secret from wife and children till the fatal end makes them widow and orphans; but little of the sorrows and the devotion of those who lived silent but heroic lives and "rest in unvisited tombs." Mitford in his "Tales of old Japan," and Purcell in his "Our Neighbourhood," have given us much valued renderings of Japanese stories and sketches in a charming and fascinating style. This small contribution of Mr. Chamberlain's is a welcome addition to what may be called the poetic side of Japanese history and narrative. We call it poetic because it arouses more emotional appreciation and reality of sentiment, and conveys more knowledge of actuality, than pages of ordinary narration. We sincerely hope that it will not be the last of the style issuing from the author's gifted pen.

#### REUTER'S TELEGRAMS.

London, 10th June, 1880.

The Secretary of State for India anticipates the withdrawal of the British forces from Afghanistan this autumn.

[FROM THE "HONGKONG DAILY PRESS."]

London, 31st May, 1880.

The Governor of the Straits Settlement has been created a Knight Commander, and the Colonial Secretary a Companion, of the Order of St. Michael and St. George.

London, 1st June, 1880.

The German war-vessel *Münster* has been ordered to Hongkong to reinforce the Fleet.

Admiral Shestakoff has been appointed to the command of the Russian Squadron in China.

## The Japan Weekly Mail.

'FAIN CE QUE DOIS; ADVIENNE QUE POURRA.'

### NOTICE TO CORRESPONDENTS.

No notice will be taken of anonymous correspondence. Whatever is intended for insertion in the JAPAN WEEKLY MAIL, must be authenticated by the name and address of the writer, not for publication but as a guarantee of good faith.

It is particularly requested that all letters on business, relating to Advertisements, Job-printing, or Accounts, be addressed to the MANAGER.

And that literary contributions of every description be addressed to the EDITOR.

YOKOHAMA: SATURDAY, JUNE 12TH, 1880.

JAPANESE ERA 2540, MEIJI 13TH YEAR, 6TH MONTH, 12TH DAY, DO-YO-RI.

### NOTES OF THE WEEK.

#### DIED.

At No. 16, Bund, on the 11th instant, of apoplexy, JOHN REEDIE BLACK, aged 53.

The O. and O. steamer *Gaelic* came into port from San Francisco this forenoon and brought European telegraphic news to May the 21st. The homeward mails went forward to Hongkong on Friday, in the M. M. steamer *Tunais*; the *Gaelic* leaves for the same destination on Monday, at noon.

**Errata** in Mr. Ewing's letter on Sanitary Reform in our last issue:—On page 723, column 2, line 17, for "fourth and fifth" read "third and fourth." Line 53, for "this" read "the." Line 55, for "system" read "systems."

On last Saturday afternoon, the 5th instant, the Cricket Club had quite a pleasant little game to themselves in which, if no very brilliant display of cricket was exhibited, plenty of fun prevailed. Sides were chosen by Mr. Dodds and Mr. Bain (seven on a side.) For Mr. Dodds' side, who went in first, Hutchison and E. J. Moss scored 10 each, A. Milne 8, and C. D. Moss 1, smaller scores and sundries finishing the innings for 50 runs. Mr. Bain's side then took the bat, and although Messrs. Thompson and Boag together added 30 to the score, the innings closed for 48. Mr. Dodds' side then went in and closed for a total of 61—Dodds 9, Hutchison 14; Hearn, who went in first and was the last to lose his wicket, scoring 29. Mr. Bain's seven put 66 runs together, winning the game by 3 runs, of which Bain contributed 14 and Mr. Davies 24.

We observe in our late files from San Francisco that the Board of Supervisors have taken the initiatory steps for the impeachment of Isaac Kallach, the Mayor. With Kearney in gaol, and Kallach expelled from office, the fortunes of the scandal agitators will be reduced to a low ebb.

Friends of Captain Robert Pitman, R. N., who was out here in command of H. M. S. *Ringdore*, during the Saga Rebellion early in 1874, will be exceedingly pleased to hear that he has been appointed Mercantile Marine Superintendent of the Thames, with full control of the three offices at the Victoria Dock, Poplar and Gravesend. The appointment was made by Lord Sandon, President of the Board of Trade.

We are sorry to observe that all hopes of the missing training ship *Albatross* may now be abandoned. The channel squadron returned from the cruise in search of the vessel, without having seen any signs of her. A part of the stern of a ship, supposed to be the *Albatross*, has been found and delivered over to the Admiralty.

Those curious personal resemblances, which are not uncommon, have given rise to the popular belief that every man has his double some time in the world. It appears that the double of an eminent philosopher of psychology at the Berlin University is a hair-dresser, whose shop is situated in the immediate neighborhood of that institution, and who, well aware of his likeness to the learned doctor, carefully copies the latter in dress, bearing and demeanour. A short time ago the professor was walking homeward from his lecture-room, when a gentleman, entirely unknown to him, stopped him in the street, saying:

"Follow me to my house. I want you to cut my hair."

The amiable professor, one of whose principles of life it has always been never to withhold from a fellow-creature any ser-

vice that it might be in his power to render, meekly accompanied the stranger home, and there addressed himself to the task thus imperatively prescribed to him. Lacking professional scissors, he picked up a pair of shears, used for cutting paper, from a writing-table in the dressing-room to which he was conducted, and with this implement proceeded most conscientiously to cut his victim's hair down to the very roots. When he had cleared about half the skull, he accidentally stuck the point of his shears into the scalp of the patient, who, springing to his feet in great pain and wrath, exclaimed:

"Can't you take care what you are about? Do you call yourself a hair-cutter?"

"A hair-cutter!" returned the astonished sage. "Certainly not. I am only Professor B—, very much at your service, as you perceive."

It is related that the new Liberal member for Shaftesbury had to take refuge in the town-hall after the declaration of the poll. He refused the offer of the defeated candidate to escort him home through the crowd, but eventually effected his escape in the guise of a rural policeman. The question naturally arises:—"Where were the voters who elected him?"

"Atlas" asks in the *World*:—"What is this I hear about that festive candidate who distributed oranges out of a donkey-cart to the wives and daughters of the electors, and nearly broke their pearly teeth on a bright new sovereign that some freak of nature had implanted in the juicy heart of the fruit?" It is more than probable that the question will be exhaustively answered when the petition to unseat the candidate (if elected) comes to be heard.

An English journal says that from being violently Conservative, Brighton has become fanatically Liberal. The other day a gigantic picture of Lord Beaconsfield, in the window of one of the leading photographers, was labelled, '*Reduced to 2l. 12s. 6d., formerly four guineas.*'

In retelling anecdotes of the late general election, "Atlas" mentions in the *World* that "a certain noble lord, whose name shall be unmentioned, went over to Galway the other day with designs upon the borough. To conciliate the sober-minded he paraded the town with a monster silver temperance medal, assertively displayed on his manly breast. 'God help us!' cried the fishwives of the Claddagh, 'what an abs-tay-mious gentleman he must be!' But the conducting agent of one of the candidates had in his pocket a report of the appearance of a certain noble lord, for drunkenness and unparliamentary language and conduct, before a Westminster police-court, and asked him how he thought it would look in large type as an election-poster. His lordship did not offer himself for the borough."

The *Bombay Gazette* contains an account of a most atrocious and cold-blooded quadruple murder committed in Penang by a Hindu priest, the victims being his wife and three children. "It appears, that the man was jealous of his wife owing to some intimacy which he observed, or imagined he observed, between her and another Hindu; be that as it may, the husband took his revenge in the most deliberate manner, he commenced striking down his wife by hitting her a blow on the back of the neck with a large sharp knife—generally used to decapitate goats at religious ceremonies—nearly severing the head from the trunk by the blow, and after some other cuts at her he started on the children in the same brutal manner and almost decapitated each of them in due course. A woman who saw him commit the crime from a short distance, gave the alarm, and fetched up some people from the lines close by, so the murderer was arrested before he was able to carry out his declared intention to the woman, of drowning himself in the adjacent lake."

An amusing story has been going the round of the American papers. The Prince of Wales went to take a Turkish bath a day or two ago, and while reclining on a slab, after indulging in the luxury of a bath, he perceived standing beside him, a very dark man, whom he took for a negro attendant. The dark man was in the usual uniform peculiar to the Turkish bath. The Prince tapped him on the shoulder, and commanded him in a curt manner to rub him down. To his astonishment the dark

man drew himself up to his full height with lofty and tragic air, draped himself in a towel as if it were a miniature toga, and with a parting look of scorn and defiance, stalked away. The Prince had mistaken Don Carlos for a darkey servant, and all the Castilian blood of the heir of the Spanish crown rose up against the heir of the English crown.

The deputies from the province of Sagami, in Kanagawa Ken, representing about 60,000 people in favour of the establishment of a National Assembly, arrived in Tokio on the 5th instant for the purpose of forwarding a petition to the Government on the subject in question. The Governor of Kanagawa, however, ordered them to return to their homes.

We have read in a native paper that those delegates were so determined to carry out their mission that they refused to comply with the Governor's request, on the ground that his interference was as a private individual only. The Governor then sent them a peremptory order to call upon him at once, upon which some of them returned here, and attended at the Kencho on the 7th instant, while others remained in Tokio, and forwarded the memorial to the Senate.

The telegram received by the United States Minister announcing the nomination of General J. A. Garfield, a prominent Ohio lawyer who for a considerable time represented Ohio in Congress, and has lately been chosen senator for that state, will be a great surprise to all. Genl. Garfield is known as a brilliant speaker and able politician. The cry of "Caesarism" has been fatal to General Grant's candidature, and the fear of a "third term" has proved more powerful than gratitude and personal esteem. The struggle among the delegates to the convention must have been long and severe, and Genl. Garfield's nomination is probably the result of a compromise. General Grant is no longer in the field for the presidency, as the whole strength of his party—the republican—is now pledged to Genl. Garfield. Mr. Hayes, the outgoing President, is also from Ohio, so that if Genl. Garfield is successful, that state will have the honour of furnishing two Presidents in succession.

The steamer *Oxfordshire* has on board a large orangoutang and two young elephants. They all appear in excellent health and are well worth a visit.

We notice in an exchange that the souvenirs of the Bona, parte family do not seem to have been greatly fancied at the San Douato sale, for the following are some of the prices. Packages of Napoleon 1st's hair, varying from 50fr. to 140fr. each; one of the Emperor's teeth, 105fr.; a cup, formerly the property of the same, 10fr.; and a pair of silk stockings, a pair of white drawers, some pocket handkerchiefs, napkins, and a shirt, all the property of the *Petit Caporal*, 200fr.! Most of these interesting relics were bought for the Shah's favourite haunt in Baker Street—Madame Tussaud's.

A native journal states that "all the Government Departments in Tokio are to be placed in telephonic communication with one another, and subsequently with all the local Governments in the different cities and prefectures. The necessary apparatus is now being manufactured in the workshops of the Central Telegraph Department, and when they are ready, the Home, the Public Works, and the Police Departments, are to be first connected." We trust that the authorities will set a good example, and remunerate Mr. Bell, Mr. Edison, or whoever is the patentee of the telephone adopted, for this wholesale use of their invention.

Mr. J. R. Black died on the 11th instant. He had been in far from robust health for several months past; but his death was very sudden and unexpected. His latest arrival in Japan was in the spring of last year, his health at that time demanding a change from Shanghai, where he had been residing for more than three years. His stay here was prolonged for various reasons, the principal being the accomplishment of the work he had set himself, the compilation of a history of "Young Japan." The first volume of this book has already appeared: the second is all but completed. Mr. Black was only fifty-three years of age. His connection with journalism in Japan and China was of long standing, large, and so widely known that it is unnecessary to do more

than refer to it in this brief notice of his death. During Friday he was, apparently, in his usual health, but at eight o'clock was seized with intolerable pain. Medical attendance was promptly obtained; but from the first it was evident to the experienced physician who was called to him that his case was hopeless. At seven o'clock yesterday morning he lost consciousness, and at noon the end came peacefully. Great sympathy will be felt for Mrs. Black, who had only a few weeks ago rejoined her husband, in her bereavement. The funeral took place this afternoon.

We have received the report of the North British and Mercantile Insurance Company for the year 1879. This institution conducts both a fire and life business and has been remarkably successful since its establishment in 1809, as the following extract from the report shews:—"The balance on the Profit and Loss Account for the year 1879, including £57,047 : 14 : 3 brought forward from 1878, amounted to £282,003 : 0 : 11, out of which a dividend and bonus of £2 : 5 : 0 per share was declared, together with a further bonus of £2 : 10 : 0 per share, representing a sum of £100,000 to be applied as an addition to the paid-up capital. A further sum of £40,000 was set aside for the dividend payable in October of the present year, leaving a balance of £47,003 : 0 : 11 to be carried forward. After providing for these dividends, and adding the aforesaid £100,000 to the paid-up capital, the Fire Reserve Fund and Premium Reserve, including the balance of undivided profit, will amount to £1,142,470. In the Fire Department, in addition to the paid-up capital of £450,000, and the Reserve Funds of £1,142,470, there is a security of £1,550,000 of subscribed but uncalled-up capital."

The North British has an unusually aristocratic directory, as we notice the list includes no less than three dukes, four earls, one baron, and five baronets.

A recent English journal states that Swansea has just celebrated the laying of the foundation stone of the East Dock, which with its tidal basin will give a new water area of 29½ acres, thereby nearly doubling the existing dock accommodation of that flourishing port. The enterprise is one of more than ordinary magnitude, as it involves the removal of the present east pier, and will occupy a considerable proportion of the tidal harbour, where at present it is mainly given over to mud banks and shallows. The Great Western Railway have, we read, already arranged to lease 1,200 feet of frontage to the new dock, and the Midland 1,040 feet, at substantial rentals; and as the dock will admit vessels having a yet larger draught than there is present accommodation for—the depth at an average high tide being 26 feet—the return for the heavy outlay which is being incurred by the Harbour Trust appears well secured. But it is to the rapid growth of the port of Swansea, which this new undertaking is designed to continue, that our contemporary desires more especially to call attention. "Even last year, one of great depression, the shipping trade of Swansea showed an increase of 127,448 tons. In 1850 the capacity of ships entering Swansea Harbour but little exceeded a quarter of a million tons, while in 1876 it reached a million tons." Lying, as this port does, in the heart of the great South Wales coal-yielding area, and being, in addition, the centre of the chief copper smelting industry of the kingdom, it appears destined to rise yet higher in the scale of our home shipping ports.

Two private races were run last Saturday afternoon on the Negishi course. In the first event Mr. Kirkwood had backed his *Velocity* against Count de Deisbach's *Gled*. Both competitors are China ponies. The latter was an easy winner, in fact the match could hardly be called a contest. The same remark applies to the next race, in which the Count's *Checkmate* beat Mr. Kirkwood's *Racer* badly, having the running to himself the whole way. The distance in either race was once round the course.

The correspondent of the *Daily Telegraph* forwards a lengthy description of the principal exhibits at the Berlin piscatorial exhibition. The correspondent says:—"The windows of the Japanese department are occupied by large and beautifully wrought water-colour sketches, representing various allegorical scenes. One—the most impressive—represents a young lady

standing in a attitude of horror and dismay in a boat, into which a huge and particularly ugly devilfish has thrust several of his many arms. What the meaning of this singular scene may be it is possible only for a true-born Japanese to say. The tables and cases here are crowded with stuffed specimens of the odd and curious fishes of Japan, and her brilliantly plumaged water birds. There are many models of smoke-houses and fish-houses, with their singular thatched roofs and sides and their crude but doubtless useful appliances. From Japan the way leads to Anam, or Cochinchina. The exhibit of this province is small, but interesting. Especially so are the devices for taking fish. Among others, is a conical basket, with which the natives capture fish by simply thrusting the basket into the water where the fish are supposed to be. China stands just round the corner. Like Japan, she displays a beautiful collection of her curious fishes and birds. A fine stuffed specimen of the feathered fisherman the cormorant, occupies a prominent place. Her implements and apparatus are well displayed. Not least attractive are twelve figures of fishermen in their peculiar dress."

During the course of some excavations and levellings which have been carried out within the historic lines of Plevna by the Bulgarian Government, sixteen cannon and ten thousand muskets have been found, which Osman Pasha caused to be buried before he surrendered to the Russians.

The Italian brigands seem to be quite as ferocious ruffians as Captain Nikko and the Greek robbers who have been exercising their talents near Salonica. We read in an exchange that brigands carried away a son from his father, at Valle della Vita, promising to restore him on payment of 6,000 francs. The father gave information to the police, and by their activity the brigands were discovered, and a cave near Caltabellotta was named as the place where the boy was to be found. The father and the soldiers, on entering the cave, found the bones of the lad lying about, the flesh having been eaten away by dogs and vultures. The boy had been murdered by the brigands in revenge for the supposed treachery of the father in giving information to the police. It is sad to think the Italian Government will probably inflict no severer punishment on the brigands than a few years' imprisonment.

A water-resisting cement which looks as though it might prove serviceable has been proposed by a German chemist. He dissolves from five to ten parts of pure dry gelatine in a hundred parts of water, and then adds ten per cent. of a concentrated solution of bichromate of potash. The articles united with this glue are exposed to the light of the sun, when the bichromate becoming reduced, the gelatine film attains great strength and flexibility. Glass ornaments and utensils when broken are said to be neatly and efficiently repaired with this mixture. Of course the very principle upon which the utility of the cement depends requires that it be kept in the dark, in order that it may act as desired when used.

The extraordinary ideas Orientals occasionally form of western customs receives fresh illustration from the following anecdote which appears in a recent English journal:—Prince Hassan, son of the ex-Khedive, now travelling with his father, was, it will be remembered, educated at Christ Church, Oxford. There is a story told of his remarking, when an august individual presented him to his wife and daughters, "Ha! So this is your harem! Well, I congratulate you!"

The St Petersburg correspondent of the *Times* writing on the 15th of April says that "M. Nicolai, the chief of the Russian Mission in Japan, has received the title of Bishop of Reval. In a speech to the Holy Synod in St. Petersburg the newly-appointed Bishop exhorted the Church to use all the means at its disposal to promote Orthodoxy as against Protestantism and Roman Catholicism. His remarks on this occasion are said to have greatly displeased Count Tolstoi, the Minister of Public Instruction, who was present."

According to recent accounts a considerable industry exists in the province of Galicia in the shape of petroleum wells though its value is much depreciated by the difficulty of transportation, the nearest railway station being thirty miles distant. The petroleum field is some four hundred miles long by forty

wide, extending from the north-west at Khenzyany to Remairi, in the south-east, and across the Carpathian Mountains to Jaslo. The most westerly of the districts in work produces about 400 barrels of oil per day, the wells varying in depth from 500 ft. to 800 ft., and the oil being refined on the spot. The other districts are very fluctuating in their yield. The Galician wells, however, produce a kind of wax called ozokerit, which is known to English house-keepers in connexion with candles.

The *Times* says that Professor Huxley gave the first of a short course of lectures on "Dogs and the Problems connected with them" at the Royal Institution, on the 6th of April. He first dwelt on the physical resemblance between dogs and men. We were in the habit of using the terms head, limbs, backbone, &c., alike for men and dogs in ordinary language, and when we come more strictly to compare the anatomy of dogs and men we found the resemblance was very close. So also in reference to mental characteristics, we commonly spoke of dogs as good or bad tempered, worthless, intelligent, &c. In fact, we measured them according to our own standard. And all the results of modern science tended to strengthen the teaching of our everyday language. In their structure, their nervous organization, and their moral nature, dogs were in every way comparable with men. A diagram of a dog on his hind legs and of a man, with the similar bones coloured similarly, showed how closely man and dog approached in bony structure. Anatomists used the same names for the similar bones. Professor Huxley pointed out how the neck, the thoracic, lumbar, and sacral regions had practically the same bones. The cranial cavity was different in size, so were the jaws, but the bones were relatively the same. The same applied to the limbs. The relative sizes were different, though the same bones were recognized. It was shown by diagrams that the front paw of the dog had bone for bone the same bones as the hand of man though in the dog the thumb was shorter. In the foot the same held good, except that in the dog the great toe was reduced to "splint" bones, though clearly recognizable. The collar-bone of man was but rudimentary in the dog, but it was clearly to be traced. Taking all the bones throughout, there was no difference except in relative size. The habitual attitude of the dog on all fours had much to do with the modification. For example, the dog walked on pads under his fingers. These comparisons between men and dogs were not speculations, they are facts. As regarded the mental capacity of a dog, we inferred he had a mind on the same principle that we inferred other human beings had minds. We saw dogs subject to pain from causes which gave human beings pain, and so with pleasure. But it was not to be supposed dogs felt exactly as we did. Indeed, there was nothing in which human beings differed more than in their sensation of pain. For example, an Englishman roughing it in Australia would feel pain less than when comfortably living at home. The order of the sense of pleasure in dogs seemed different from what it was with us. Dogs could not see so well as we did. Their hearing was more acute, but it seemed to give them pleasure in a different way from what it did with us. For example, a dog would howl at a band giving what we might regard as fairly good music. Their smell was more acute than ours, but dogs did not appear to care for patchouli, eau de cologne, or eau de toilette, while garbage, which we loathed, they revelled in. The way in which a dog would follow the footsteps of his master's shoe-leather and recognize the difference of that shoe-leather from all others was truly marvellous to us with our sense of smell. Taking the whole range of dog-like animals, Professor Huxley recognized the number of species as about 30. Drawings of many of the different forms of dog-like animals, including the icterion, the fenec, and the abeyon were shown.

#### LONDON LETTER.

LONDON, April 15th, 1880.

Sir Harry Parkes I understand is ready to go out once more to Japan as soon as the preliminaries for revision of the treaties are arranged. Considering the absolutely experimental character of the treaties of 1858, it is truly wonderful to think how well they have answered the purpose of regulating commercial intercourse between Japan and the Western world. But considering further all that has happened in those twenty-two years, not only in the organic structure of the Japanese state, but also in the conditions

affecting the commerce of the world, it is not surprising if considerable modifications are now required by the Japanese Government. These are of two kinds, practical and sentimental. In the former category is to be reckoned the revision of the Customs' Tariff which the Japanese Government desires to raise for the double purpose of revenue and protection to native industry. As mentioned before there can hardly be any great difficulty in the way of these demands being conceded if the Japanese are themselves resolute and clear about what they want. No European, still less American, Government is going to apply force to a country which has been, on the whole, so loyal to its engagements as Japan, on a question of import duties. The sentimental group of demands will, as is usually the case, present the most serious difficulties. For the Japanese Government aims at a complete withdrawal of the extra-territorial jurisdiction clauses in all the foreign treaties. This demand cannot even be listened to, and it is probably the consciousness of an insurmountable obstacle in their way, that leads to the Japanese negotiators putting off the struggle and shifting the venue from Tokio to London, and now back to Tokio again. It is more easy to enter into the feelings of the Japanese on this point than it is to furnish logical reasons for denying them what they want. There are some things which can be felt, but cannot be argued about, and this question of the Western Governments retaining their jurisdiction over the persons of their citizens residing in Japan can only be decided in one way, and it is impolitic for the Japanese to provoke a discussion on it. It is a subject for a debating club, but not for diplomats to mullie with, and I am not sure whether, as a mere matter of theoretical discussion, the advocates of the surrender of extra-territorial jurisdiction might not show the strongest case. At least that was my impression, after hearing the question bandied about for a couple of hours last week among my friends in T. But it has to be remembered that the only individuals present who had special knowledge, were the two Japanese who were of course prepossessed in favour of the one view, and it does not follow that because neither Mr. P. nor myself knew enough about the subject to parry the thrusts of the two champions, there are not crushing arguments against the Japanese contention. Mr. O. takes a very strong patriotic view, and burns at the indignity of placing Japan on a lower level of civilization than Italy, Russia or Greece, in none of which countries do other states attempt to follow their subjects with the long arm of a special protection, the machinery of law courts, prisons and the rest. He claims for Japan a higher place in the scale of international morality than either of those countries, with Spain thrown in, and he maintains that life and limb are on the whole much safer in Japanese territory than they are in any one of those countries. K. takes a more moderate and less one-sided, but still a Japanese, view. He admits that when the treaties of 1858 were made, the little that was known of Japanese ways fully justified the European Powers in retaining jurisdiction over their nationals. But he argues, since then Japan has purged herself of all suspicious taint: has cheerfully, indeed eagerly, entered the comity of nations; has put on western civilization like a garment; and has, in all things external as well as internal modelled herself after the pattern of the Western Powers; and submitted herself and her doings to the educated opinion of the world. By these astonishing reforms Japan has, according to him, earned the confidence of the civilized world, and if Greece and Italy with their brigands, and Russia with her secret police and terrorism, are entrusted with the lives and property of aliens, the time has come for Japan to be relieved of the invidious stamp of inferiority. Both the Japanese gentlemen carefully avoided touching on the question of the treatment of Chinese residents in California, for fear of treading on the toes of Mr. P. but it nevertheless struck me that the bad faith or the incompetence of the Californian legislature and executive to protect strangers, lent considerable support to K.'s arguments. I suggested that Japan was nevertheless in good company as the Empire of China, whose intercourse with Europe was of much older date, and which was ten times as populous as Japan, submitted to the same limitation of its sovereignty. This produced a burst of impatience from both the Japanese, who would not allow China to be in any way compared with Japan. China, they argued, had tried everything she could to keep out of the comity of nations: her diplomacy was marked by bad faith throughout, her laws were a barlesque; her officers venal from the top to the bottom of the scale; and her whole system of criminal and civil procedure was a scandal to humanity. I then ventured to remind them that extra-territorial jurisdiction prevailed also in the Turkish Empire. Yes, replied K., and when you have mentioned Turkey you have exhausted the list of states which, while retaining their independence, are obliged to admit a whole series of *imperium in imperium* within their borders, in the shape of Consuls exercising sovereignty over their respective nationals where two or three are gathered together. Now, said he, listen to me and I will tell you what is the pretext under which the Christian nations refuse to Turkey, China and Japan, the full exercise of their prerogative of sovereignty. It is simply the alleged heterodoxy of these states. "And you know," he added, "that when a dispute resolves itself into a difference of religious form and ceremony, reason and justice at once take flight, for no man, still less any community, prepossessed by one system, is ever able to deal fairly by those who follow another."

"Do you mean to say," inquired Mr. P., "that what is called in this part of the world a 'religious test' would be exacted before a country like Japan could be admitted to full jurisdiction over aliens of Christian faith?"

"That is precisely what I mean," replied K. "If the Japanese Government were to-morrow to profess and call themselves Christians without any change in their habits or any reform of their laws, the stigma of extra-territoriality would be at once removed. And any

\* See *Japan Weekly Mail*, April 24th, 1880.

boly but a Christian would see that this state of things is flagrantly unjust to the Japanese."

The lady whom I introduced to you on a former occasion had been listening attentively to this conversation. (As I can neither give her family name nor yet her *som de théâtre* without breach of confidence, I will henceforth for my own convenience and yours call this lady Sibylla.) She evinced a peculiar interest in the references made to the Christian religion, and when K—— spoke hypothetically of his countrymen adopting it she eagerly broke in: "And why should they not?" We were all interested to see how this challenge would be met, but I was hardly prepared for the quasi-philosophical disquisition which followed. K—— first looked leisurely round the table (it was a card-table and O—— played "patience" all through the discourse) for the apparent purpose of assuring himself that he was not being "drawn." Having satisfied himself that we were all quite serious he said: "Well, your question is a pertinent one, and under different circumstances I am not sure that our Government would not have made Christianity the State religion of Japan. For my own part, however, I am glad that this is not to be, because had as popular Christianity is, I have too much reverence for its central figure to wish to see his name turned to so base a use."

This somewhat oracular exordium served to whet our curiosity, and we all begged our friend to explain himself more fully. This he did at considerable length, and by the aid of much interrogation. To reproduce the dialogue in set order would be quite impossible, but the drift of K——'s remarks was something like this. He first knew Christianity in his youth in Japan as a historical study, and learned to detect it as an insidious power which sought, by means of spiritual agencies, to usurp the authority of the state. At a later period, when his researches extended to the history of Christendom itself, he found little else but strife, bloodshed and cruelty practised by one nation on another, and by one sect on another, all in the name of the Christian religion, and after, as they more blasphemously termed it, for the "glory of God." He saw the most conspicuous figure in Christendom sitting on the seven hills, hypocritically designating himself the "Servant of the Servants of God," but in reality attempting, and for many centuries playing, the part of "King of the Kings of the Earth." When he came to live in Europe and saw what Christianity was in real life he became dumbfounded by its glaring imposture. You may be sure that Mr. K—— was not allowed to say all this without protest; I am merely trying to give you faithfully the substance of his observations. What he meant by the imposture of contemporary Christianity was its almost total opposition to the teachings of Christ. Intellectually, he insisted, it was made an affair of creeds and types, and morally of pelagian ceremonies, none of which receive the smallest countenance from the lofty and pure mind of Jesus. The ritual, he maintained, was scarcely better than the Buddhist worship which educated men in the Far East had long outgrown. It contained a large admixture of heathenism, in its quasi-sacred literature as well as in its practice; and every Sunday it ground out the rude standard of morals given to the Hebrews in the most barbarous era of their history, that is to say the Mosaic Decalogue which a man might faithfully keep in every point and still be a bad man and a bad citizen. He had seen the banner of the cross carried triumphantly over the Balkans three years ago through oceans of innocent blood, and the name of Him who would not return railing for railing, and who distinctly declared his kingdom was not of this world, invoked to sanctify the ruthless slaughter. The thought, he declared, made him sick, even now. He acknowledged, indeed, that these things were done by the most ignorant race in Christendom, but their deeds he maintained were applauded by the most civilized, the most moral, the most Christian men in holy England. In short, turn where you may, the aspect which Christianity presents to the non-Christian world is hateful. It is no wonder therefore that its propagation spreads but slowly; indeed it is fortunate that it is so. Mr. K—— was candid enough to acknowledge, however, that a more intimate acquaintance with individual men and women showed that, buried in this mass of arrogance, imposture, and crime, there was a vein of the true metal, enough to show that the Master had not lived in vain. Indeed our friend professed such strong admiration—that the evangelists would call love for the man Christ Jesus—that he says he only needs a little alloy of hypocrisy to make him a true Christian in our conventional sense of the word. This is only a bald outline of what the man said, and it really does no justice to his arguments, which would occupy far too much space to recapitulate. It made a great impression on Sibylla, who remarked to me afterwards in an undertone that she had felt a great deal of all this herself for many years, but dared never formulate her thoughts.

As for O——, he declared the subject did not interest him a bit. He had no doubt that Christianity was a better religion than Buddhism; if we said that, he would not contradict us; but as he was far from being a good Buddhist, it was quite premature for him to aspire to a superior faith. No use trying at the five-foot bar, he said, when you have not been able to clear the three-foot.

## PARIS LETTER.

(Scientific.)

PARIS, 10th April, 1880.

M. Faye is not satisfied with the origin of the solar system as expounded by Laplace; but then many astronomical phenomena have been cleared up since Laplace's time of observation; his

hypothesis, according to M. Faye, has not geometric precision, nor is it in harmony with facts. Laplace started with the assumption that a globe existed, possessing all the mass of the solar system, and deriving all its mechanical energy under the form of rotation, by the action of intense heat whose origin was not defined. The atmosphere of that mass was dilated as far as the limits of our world: in cooling down, it cast off here and there the materials for planets: the primitive energy remained, but it was in the circulation that it existed almost in its entirety. It was thus to heat, and the play of centrifugal force, that Laplace traced the origin of the solar system. Unhappily the presence of heat was only a supposition. M. Plateau's pretty experiment roughly illustrated the idea. He took a drop of oil, immersed it in a liquid of the same density, through which passed a vertical thread: on twisting the thread rapidly, the oil participates in the rotatory movement: if the tangential rapidity be sufficiently strong, the force of cohesion can become incapable of struggling with the centrifugal force. In that case tiny globules will become detached from the mother-drop, and revolve around it like little stars. In Laplace's theory, the planets became detached from the sun's atmosphere, not from the sun itself. Based upon uniformity of rotation the planets and their satellites ought to be subject to a common law of evolution, yet this is not so, the satellites of Uranus, for example, instead of having a *direct* movement as Laplace presumed, have a retrograde one, and the planet itself may have the same. Similar observations apply to Neptune and his satellite. Our solar system is thus divided into two moieties; the one, interior, where the rotation is *direct*, the other exterior, where the rotation of the planets and their satellites is *retrograde*. It is then difficult to accept Laplace's theory, that our planetary system is the result of the progressive condensation of different portions of a nebulous ring of matter thrown off by the sun. M. Faye thinks that nebulæ alone are capable of forming single, double, or triple suns, or a mass of petty suns. On a clear night and with a good glass, the observer can descry in the heavens a series of forms at first rudimentary, and then become more and more developed, just like the naturalist, who in traversing a forest takes in at a glance the phases of life in the same trees, although these phases demand, for the individual tree, a succession of years for its development. Thus in each nebula there is, according to M. Faye, a sort of development of life peculiar to itself: what is vague and chaotic, would have points of condensation and of gradual absorption, finishing by becoming suns. Heat in this case would be unnecessary. Let us apply these ideas to our system. Supposing our nebula extended in a space one-hundred times greater than the orbit of Neptune. What ought to be the density of the matter capable of furnishing elements of our solar system? According to M. Faye's calculations, it would be less by 250 milliards than that of the air in a receptacle reduced to part of its volume! The temperature would be next to zero. Some of these rings of matter would have a circular or direct rotation like Saturn and Jupiter; others, losing the primitive impulsion, would condense elliptically and take the retrograde movement like Uranus and Neptune. This is the phenomenon which our world presents, and implies an increasing density from the border to the centre of the nebula. Condensation would thus be, not the result of cooling down, but of simple condensation by gravitation. As to the dissemination of obscure matter, which contains such power and marvels, that is a mystery which M. Faye relegates to all questions affecting origins.

Dr. Boncherson pays attention to deafness in children, produced by catarrh, which is communicated to the drum of the ear through the medium of the Eustachian tube: atmospheric pressure is transmitted to the extremities of the acoustic nerve, which can be crushed, if the pressure be prolonged; if the nerve be destroyed, deafness follows, and in the case of infants, dumbness also. To remedy the infirmity no time should be lost in relieving the acoustic nerve of the pressure, by blowing, into a corner of the tympanum, a certain quantity of air, which will force the head of the drum outwards, as it were, and with it the chain of little bones. To retain the infant in the necessary condition of quietness for performing the inflation and canterization, an anæsthetic should be resorted to. With the return of hearing will follow that of speech: the child ought to learn only a few words at a time and to pronounce them very distinctly. Dr. Boncherson states that deafness and dumbness are not hereditary, but the catarrh which causes it is, and that consanguinity can aggravate the malady.

The medico-psychological society has been discussing drunkenness. About 55 per cent of the crimes in France are committed under the influence of drink, and it was urged that the courts were too lenient in so readily according irresponsibility to those who, when intoxicated, break the law. Dr. du Sault insisted on a difference being made between alcoholism and drunkenness: the latter is accidental and voluntary, consequently immoral and reprehensible. Drunkenness weakens moral liberty, since the legislation of every country considers as nil all contracts executed where any of the parties thereto have been intoxicated. In ancient society inebriety aggravated the crime. According to the French Code, it neither attenuates nor aggravates a misdeed: the law examines the mental state of the accused at the moment of the commission of the crime. So much for a drunkard; but for an *alcoholic* the case is different, he drinks, because he is insane, and is insane, because he drinks. Under the prey of alcoholic hallucination he loses all conscience, all memory. Hence crimes are easily perpetrated; he becomes sombre, irritable, and the victim of illusions. Instead of sleep, he has night-mares; and imaginary voices urge him to assassinate his fellow beings. The man is simply mad, and irresponsible for his acts. The difficulty lies when the *alcoholic* is not mad and yet more than drunk: in this case medical experts ought to be called in. It is in the evening that the real *alcoholic* gives way to his impulses, and he who takes slight doses of spirits daily is more liable to alcoholic insanity, than those who get drunk periodically.

The feeling was general, that the guillotine ought not to be called in to cure alcoholic insanity. This was an allusion to one Prunier, who was executed a few months ago for a barbarous murder. The doctors testified he was insane from drink and irresponsible; immediately after decapitation his head was dissected, and the brain was discovered to be wholly diseased from alcoholic poisoning.

M. Péroche continues his curious studies on the oscillations of the poles and their influence on temperature at the surface of the globe. The French Admiralty is investigating the subject, for if the poles are not invariable, changes of latitude, and consequently of temperature must ensue. M. Péroche maintains that the movement in the crust of the earth produce a displacing of the poles. The kernel of the earth being fluid, the slidings of the envelope are obvious; but the crust of earth does not follow the forces which react on it with the same docility as do tides. The impulsions and resistances are not uniform, but they may take place suddenly from an accumulation of pressure. It is quite possible that these internal tides of the earth may have exercised an influence during geologic ages on that crust which to day forms terrestrial geography. It is the moon, according to M. Péroche, which, despite the variety of its movements, contributes most to these slidings of the envelope of our planet. The point to know is, can the moon's attraction so act? It is quite possible that these subterranean tides, having no liberty of movement, can produce only formidable pressures, and that these, owing to the relative position of the earth, of the sun, and of the moon, cannot be without connection with earthquakes, volcanic eruptions, and fractures of the earth's crust, in modifying the beds of oceans and the forms of continents.

M. Carl Vogt has exhibited a photograph of the *archæopteryx* in its complete state; this fossil animal belongs to the Jurassic period, and recalls the whimsical monster with which the cosmogonic traditions of high antiquity peopled the earth at its origin. It resembles a bird in its pelvis, hind legs and feathers, and a reptile in the head, jawbones full of teeth, its prominent vertebra on the neck, and round throat. Thus, it could both fly and stand up, recalling, however, more the bird that flies, than the reptile which crawls.

Chamber floriculturists will feel interested in the experiments of the celebrated botanist, M. Massee, on the evaporation of water, the influence of soil, and the transpiration of plants. He took three vases, each having an area of one hundred square inches; one contained water, another earth, and the third earth in which an immortelle flourished. He weighed the vases daily, and found that the soil acted most efficaciously on vegetation when in a damp state, and attracted and condensed the watery vapor of the air, in the form of dew, when the atmosphere was sufficiently humid. Plants consume from three to four times more water than disappears directly in the form of evaporation; but at the flowering period the plant's transpiration is ten times superior to the soil's. Vegetation is ten times more intense during the day than in the night, and more so in the morning than in the evening.

Dr. Bonchut has prepared, from the juice of a South American plant, *papayer*, an agent called papaine, or vegetable peppingine: it possesses the remarkable property of acting upon, or digesting animal or vegetable tissues. It was found most efficacious in croup affections by dissolving the false membrane. Mixed with meat or albuminous matters, it reduced them speedily, digested them into a pulp fit for assimilation. Applied to cancers or proud flesh, the papaine "digested" even these surfaces.

A druggist's journal in Alsace-Lorraine draws attention to the "explosive" medicaments employed in that country. A tonic is composed of hypophosphite of lime, chlorate of potash and lactate of iron: the chlorate has the property of provoking appetite, but the rapidity with which the chlorate parts with its oxygen, and the readiness with which the hypophosphite becomes a phosphate, produce much heat, and acting on the lactate generate a gas as explosive as that from gunpowder. A tonic consisting of the same chlorate, glycerine and perchloride of iron exploded in the pocket of a patient; the chlorate and cashoo formed a tooth powder, which exploded in the mouth, by the rubbing of the brush. Oxide of silver pills, often prescribed in England for chronic affections of the stomach, took fire in the pocket of another patient. This is not the healing but the pyrotechnic art.

M. Nordenskjöld has been received with all honors by the President of the academy of sciences, Mr. Daubrée. The brilliant navigator seemed to place the scientific results of his mission very low, as compared with those that he secures for the commercial world; opening up Siberia means assisting the exportation of metals, fossil ivory, and skins, to say nothing of valuable articles of food, and precious stones.

The Meteorological Office of France has published a table of the storms for the year 1876-7. Storms are the most obscure phenomena in all meteorology. Electricity plays a preponderating rôle therein. But what are the sources of electricity which accumulate in the air: by what law is it disseminated: what is its part in the formation of hail, and the march of storms? No definite answer can yet be given. Generally two types of storms are admitted, winter and summer. The latter are formed by heated currents of air ascending into the higher regions, where, by abandoning their watery vapor, they form clouds, and thus, acting as a screen for the lower layers of air, produce cold, condensation and electricity. Winter storms are due to the collision of two opposite winds, producing on a small scale the phenomena of a cyclone, when atmospheric depression is very great, while in summer it is just the contrary. Forests have an effect on the passage of storms, as, in the department of the Orne, they constitute an insurmountable barrier. Is the cause due to the trees attracting the electrified clouds? Electric explosions transform the nitrogen of the air into ammoniacal and nitric products, good for vegetation, and enrich oxygen with ozone, which is excellent for respiration.

## THE DESTROYING ANGELS.

(An Eastern Myth.)

I.

From their home in the starry spaces  
 Oft-times they come and go,  
 And the angels' garments sweep the earth,  
 What time we may not know,—  
 But the strong rocks feel and crumble  
 In soundless, sure decay,  
 Thro' springs that bud and blo-som,  
 Thro' winters chill and gray;  
 And the great green hills, like giants  
 Ask-up by firesides cold,  
 Shudder and shrink in silence,  
 Touched by each radiant fold.  
 The winged robes rain perfumes rare,  
 And subtle as celestial air;  
 Yet bring earth's day of doom and death,—  
 'Tis thus the ancient legend saith.

II.

From her home in the starry spaces  
 (No legend I tell you now)  
 Descendeth an angel, solemn-sweet,  
 With light on her lifted brow;  
 And the high-piled rocks of error,  
 And the climbing heights of wrong,  
 Where the chain'd soul crouches weakly,  
 And the right is with the strong  
 Slowly and surely crumble,  
 Like sun-swept drifts of snow,  
 Beneath the angel's vestments  
 Trailed softly to and fro,  
 While poet seer and prophet-ago  
 Already sing the "Golden Age,"  
 When all shall kneel to Truth with them,  
 And kiss her garment's shining hem.

F. B. H.

Tokio, 12th June, 1880.

## JAPANESE NEWS.

[The following Notes on various Japanese matters are chiefly derived from the native papers, occasionally supplemented from original sources of information, and are carefully collated and edited, so as to make them readable and intelligible.]

### COURT, POLITICAL AND OFFICIAL.

It is stated that His Majesty the Emperor will, while at Kioto, worship at the tomb of his father, Komei Tenno.

On the 4th instant, His Excellency Iwakura, the Junior Prime Minister, accompanied by several high officers of the Naval Department, inspected the Ishikawa dockyard, situated at the embouchure of the Sumida River.

The *Mainichi Shimbun* says that it has been decided to establish an observatory at Iwabana, in Gumbu Ken, and that it will be under the control of the local authorities.

In each of the police stations of Tokio, officers will be specially appointed to attend to the measures necessary for the prevention of cholera.

The *Nichi Nichi Shimbun* says:—"When Kinjiro, the Japanese carpenter, was about sailing for Peru in company with about five hundred others of the same trade, the authorities interfered and prevented the party from leaving. This step caused considerable negotiation between the Peruvian and Japanese Governments, and was at last settled by the latter agreeing to pay the former the expenses incurred. The exact sum to be handed over was long in question, but it has now been agreed at 7,390 yen."

A meeting of the local board of health was held at 1.30 p.m. on the 4th instant, at the Tokio Fuchō. A number of medical practitioners, members of the local assembly, and police officers were present, the Governor, Mr. Masuda, presiding.

His Majesty the Emperor visited the Aoyama palace on the 3rd instant, and had an interview with Her Majesty the Empress Dowager.

As His Excellency Nabeshima, Minister to Rome, and His Excellency Nagaoka, Minister to Holland, are shortly leaving for Europe, they were presented in audience with His Majesty

the Emperor, on Monday forenoon. They were then handed their credentials for presentation to the Kings of Italy and Holland.

A native journal states that "the Shizoku of Kagoshima, who are renowned for their brave and fearless disposition, have become more unsettled and restless since the last rebellion. They frequently visit the Governor of the prefecture in large bodies, and enter into excited discussions with him, thus causing much anxiety to the local officers. Mr. Secretary Watanabe has now memorialized the higher authorities, proposing that these unruly shizoku shall be at once removed to Tokio, so that they may see the state of affairs in the capital, which will, he thinks, have the effect of reconciling them to the present régime. It is reported that, in acquiescence with Mr. Watanabe's suggestion, five thousand of these shizoku between the ages of twenty and thirty years are shortly to be sent up to Tokio and enrolled in the police force."

The *Nichi Nichi Shinbun* says:—"We hear that as, during the absence of His Majesty the Emperor from the capital on his visit to the provinces and city of Kioto, he will be prevented from attending to the administration of affairs in person, therefore Their Excellencies Prince Arisugawa and Iwakura, the two Junior Prime Ministers, are to be charged with the conduct of business in accordance with His Majesty's will. When anything of great importance arises, Their Excellencies are to report to His Majesty and take his instructions. If any matter takes place of so pressing a nature that no delay can be incurred, Their Excellencies are to decide and report the circumstances to His Majesty at once."

Mr. Inouye, Chief Secretary of the Legislative Section of the Daijo Kuwan, who was lately sent to China on a special mission, is now in Peking. It is said that, as the object of his mission is not as yet attained, he will remain in Peking two or three months more.

A native paper says it is probable that Ministers to foreign courts are hereafter to be chosen from among the military officers above the rank of Lieutenant-General, and the naval officers above the rank of Rear-Admiral.

The *Nichi Nichi Shinbun* has been requested to correct its statement that the Okinawa (Iaohou) Keneho, is to be built in European style. It will be built after the old Japanese fashion.

Four shizoku of Ibaraki Ken, Noté, Watanabe and two others, proceeded to the Daijo Kuwan on the 3rd instant, and demanded an interview with one of the Prime Ministers. Mr. Secretary Kanai presented himself and received them, when they handed him a document, which he, however, returned to them at once. It is surmised that the document in question is very probably on the subject of a National Assembly.

Twenty-two students have lately successfully passed the examination at the agricultural school at Komaba. Their Excellencies Matsukata, Minister of Home Affairs, and Shinagawa, Chief Superintendent of the Agricultural Bureau, proceeded to the school during the forenoon of the 8th instant, and distributed the usual certificates.

The local assembly of Kanagawa Ken was formally opened at 11.30 a.m. on the 8th instant, in one of the rooms of the Yokohama Town Hall. Mr. Imafuku has been elected President, and Mr. Hayashi, Vice-President.

As His Excellency Matsukata, Minister for the Interior, leaves the capital on the 13th instant in advance of the Imperial procession, he gave a farewell banquet on the 8th instant, in the Enriokwan.

His Excellency Okuma entertained the two Ministers to Foreign Courts, Nabeshima and Nagaoke, and the functionaries who have been appointed to accompany the Imperial progress, in all about one hundred and fifty guests, at his private residence outside the Kijibashi, on the afternoon of the 8th inst.

Mr. Hachisuka, Chief Superintendent of the Custom House Bureau in the Finance Department, inspected the Yokohama Custom House on the 8th instant.

A native journal states that:—"The Imperial procession will leave the place at 7 a.m. on the 16th instant, and arrive at the port town of Fuchin, at 11 a.m., to which place Their Majesties the Emperor and Empress Dowager and many high dignitaries of state and the Foreign Representatives will accompany His Majesty. Governor Matsuda, of Tokio, will remain in the Im-

perial train as far as the town of Hachioji, where His Majesty will be received by Governors Nomura, of Kanagawa, and Fujimura, of Yamanoshi, Governor Matsuda returning to the Capital. At Hachioji, a number of Shinto priests, all dressed in their ceremonial robes, will salute the Imperial procession with music."

The *Mainichi Shinbun* says:—"It is currently reported that the Chinese Minister will return to Peking about November next, when he will be replaced by a new Minister. We cannot, however, vouch for the truth of the rumour."

It is said that Mr. Takezoze, Consul-General for China, will leave for his post about the 23rd instant.

Messrs. Abo and Sakunishi, officers of the Custom House Bureau in the Finance Department, have been ordered to Nagasaki, Kobe, Yokohama, and Niigata, &c., for the purpose of inspecting the Custom Houses at those places.

His Excellency Yoshiwara, Vice Assistant Minister of Finance, and Mr. Yamaoka, Chief Secretary of the Imperial Household, who with their staff left the capital in advance of the Imperial procession, arrived at Kioto on the 4th instant.

A native journal states that the Chinese Government is about to commence the construction of telegraphs, and has requested the Japanese Government to lend them telegraph operators.

Mr. Senator Sasaki, has been appointed Chief Commissioner of a Bureau, established in the Senate, for examining the legal procedure for a Marine Court.

An Assembly in Kochi Ken was opened on the 17th of last month, Mr. Yamaoka being elected President, and Mr. Nakayama, Vice President. Debating was commenced on the 18th ultimo, the members again discussing the system of electing the members, and their rights, which occupied more than a week. They at length came to the conclusion that they should address a petition to the Government on the point in question. In consequence of the disagreement a number of members have resigned.

Mr. Imamura, Under Secretary for Home Affairs, attended the sitting of the local assembly of Kanagawa, on the 9th instant.

His Excellency Ito, Privy Councillor, who has been appointed to accompany the Imperial progress, being now unwell, is reported to have been replaced by His Excellency General Yamada.

It is estimated that the Imperial tour will cost about 160,000 or 170,000 yen.

Mr. Yamaoka, Chief Secretary of the Imperial Household, and Mr. Nishimura, Chief Secretary for Home Affairs, who have inspected the route to be taken during the Imperial tour, have now returned to Tokio, and will accompany the Imperial procession.

#### NAVAL AND MILITARY.

A regiment of cavalry belonging to the Tokio garrison has been ordered to Hachioji by way of Kawagoe, for exercise. A regiment of sappers have also left Tokio for Kamakura, on a march out.

The battery about to be constructed at Kwanonaki, will necessitate pulling down the famous temple of Kwanon at Hashiramidai, and several dwelling houses in the neighborhood.

It is said that the Tokio garrison is to be strengthened by the addition of another regiment of horse.

The Commander of the Imperial Guard has notified the military officers who have lately been appointed to accompany the Imperial progress that, as it is very necessary for them to be well acquainted with the different districts, they are to pay particular attention to the natural features of the localities passed through, the situation of the roads, the facilities for transport by water, the population, the number of houses, &c., in fact of everything which may be useful in military matters, no matter how trifling they seem. On their return to the capital the officers are to prepare and forward a full report to the office of the Imperial Guard.

The *Raiden Kan* left here on Wednesday last for the purpose of surveying the island of Saghalien.

A telegram received at the Eastern Admiralty Office, announces that the *Higei Kan* arrived safely at Bombay, on the afternoon of the 7th instant.

It is rumoured that the revised military code is shortly to be published.

There was a rifle match at Etchju-jima, Tokio, on the 10th instant, among the men of the first battalion of the infantry of the Imperial Guard.

The Japanese man-of-war *Rinjo Kan*, will shortly sail for Singapore.

As there has been no place yet appointed in the island of Yesso for the distribution of the garrison forces, the Department of War has now applied for the purchase of 10,000,000 tsubo of land in the province of Ishikari, 150,000 tsubo in Iburi, 10,000 tsubo in Kitami, 200,000 tsubo in Nemuro, 80,000 tsubo in Shiribeshi and 200,000 tsubo in Toshima.

Cannon and many other warlike stores have lately arrived here from Germany. They were ordered by the late Saigo Takamori, during the time he held office as Field-Marshal in the Japanese army.

#### INDUSTRIES, TRADE AND FINANCE.

Permission has been granted to Sato Noboru and several other persons, to establish a private bank in Tokio. The proposed institution will be called the "Asahi Giuko."

The *Choya Shimbun* states that the following is the amount of internal revenue which it is estimated will be collected during the year, July 1880, to July 1881:—

Land Tax	...	...	...	...	Yen 41,901,441
Mining	...	...	...	...	12,544
Taxes on the productions of the Hokkaido	...	...	...	...	431,451
" " Liquors	...	...	...	...	5,965,029
" " Tobacco	...	...	...	...	291,500
Revenue Stamps	...	...	...	...	650,010
Postage	...	...	...	...	1,410,000
Ruled Paper for legal use	...	...	...	...	85,415
Taxes on Certificates of Lawyers	...	...	...	...	10,000
" " Vessels	...	...	...	...	146,270
" " Vehicles	...	...	...	...	309,270
" " Public Companies	...	...	...	...	500,000
Shooting Licenses	...	...	...	...	45,917
Taxes on dealings in horses and cattle	...	...	...	...	67,589
" " Proprietary Medicines	...	...	...	...	65,879
" " Weights and Measures	...	...	...	...	3,006
Copyrights	...	...	...	...	3,556
Passports to foreign countries, &c.	...	...	...	...	3,263
Total,	...	...	...	...	Yen 51,905,140

The *Mainichi Shimbun* mentions that, "in consequence of the large export of rice and beans from Corea, the price of these articles has risen from three *mon* per *sho*, to the enormous sum of fifteen *mon*. This has caused so much distress that many influential Coreans have endeavored to put a stop to the trade, and the Government has furthered their views by forbidding any export of cereals. The result has been that a good deal of contraband business is going on and many deliveries of grain are made at night. On the 21st of May, an English war vessel anchored at Fusan, and an official of very high rank who was on board, landed and inspected the Japanese Settlement. He expressed himself greatly surprised and pleased at the clean condition of the settlement and its inhabitants, which was, he said, very different from what is usual among the Chinese and other eastern people. The Coreans are very much struck with the superiority of vessels of foreign form of construction, and freely admit the great improvement they exhibit over the native craft. It is therefore a certainty that, in a short time, the Coreans will abandon, as far as possible, the use of junks and employ the improved type of vessel."

A native journal states that the sum of 69,800 yen is to be appropriated to the encouragement of industrial undertakings in Okinawa Ken (Loochoo.)

A large number of articles illustrative of the products of Japan are to be forwarded to the Melbourne Exhibition. The Agricultural Bureau is sending specimens of trees, plants, &c., and samples of tinned salmon and venison, paper, pictures and numerous other exhibits.

The *Nichi Nichi* states that the rumour is altogether without foundation in fact, that a foreign merchant was about to establish a rice exchange in the foreign settlement in Yokohama, thus taking advantage of the protection afforded him by the extra-territorial provisions in the treaties. It is alleged that the merchant's name was made use of without his knowledge or consent by some of his servants (banto and interpreters) and on the scheme becoming known they were at once discharged.

A large quantity of rice has been sold by auction, at the Government godowns at Asakusa, to the retail dealers.

The brokers of the two rice guilds at Kabutocho, and Kakigaracho, Tokio, have been permitted to carry on their business since the 3rd instant.

A private savings bank has been established at Yorocho, Nihon-bashi, Tokio, with a capital of 20,000 yen.

It is proposed to construct a jetty 75 *ken* (450 feet) long from the landing place at the Kobe Custom House, at an estimated cost of 60,000 yen.

The *Nichi Nichi Shimbun* says that it is not true that the *tempo* is to be withdrawn from circulation in the month of October next.

The Osaka Mint has lately been coining tempo and other old copper money into the new forms, but owing to the scarcity of small money at present, the Mint Authorities have ceased the recoinage.

On the 4th instant, two thousand boxes of tea were brought to Yokohama by the *Shizuoka Maru* from Shimizu, and six hundred and eighty-nine boxes by the *Kanagawa Maru* from Kawasaki.

The Shimbashi in Tokio, which is now in a damaged condition, is to be rebuilt of stone, at an estimated cost of 8,000 yen.

The *Bukka Shimpō* has recently published telegrams, to the effect that the new silk crop in Italy promises to be good, while that in France is not so flourishing. The Spanish harvest is not likely to have good results.

Cigars manufactured in the prefecture of Kagoshima, which is noted for the good quality of the tobacco it produces, are to be sent to the Melbourne Exhibition.

Time bargains on rice having lately been prohibited, similar transactions in salt, tea, &c., have commenced at Koamicho, Tokio.

In consequence of the scarcity of small money in circulation, the Finance Department has placed 1 rin copper money, amounting to 30,000 yen, on the market.

The *Niigata Maru*, which arrived here on the 5th instant, brought 140 cases of silver coins from the Osaka Mint, for the Expenditure Office in Tokio. Each case contained 2,000 yen.

#### MISCELLANEOUS.

The return published, by the Tokio Fucho, of the population of the capital, shews that there are in the city 811,520 inhabitants, and 251,488 houses.

Fatal cases of cholera are stated to have occurred in Kioto Fukuoka, and Kumamoto.

We learn from the *Nichi Nichi Shimbun* that the order sometime since issued, forbidding Mr. Kishi Kiroku, the manager of the *Futsu Shimbun*, and some other residents of Awa, to lecture on current political topics, has been rescinded.

A wealthy noble, and two leading merchants of the capital, have proposed to build, at their joint expense, a bridge over the Sumida River between the Ohashi and Eitai bridges. The matter has been laid before the Engineering Bureau.

A native paper says that heretofore a steamer has been plying between Kobe and Corea, but as the traffic to that country is rapidly increasing, a steamer will run direct from Yokohama to Fusan after the beginning of next month.

A fatal case of cholera is reported to have occurred at Imakumura in Aichi Ken.

As already reported, small-pox made its appearance in the prefecture of Tokushima, some time ago. The number of persons who have been attacked from the beginning of the outbreak in the month of January, until the end of April, is 1,085, of whom 169 died, 230 recovered, and 616 are still under treatment.

The editor of the *Yamagata Shimbun* has been fined ten yen for breach of the law of libel.

A case of cholera occurred at Choja-machi, Yokohama, at 11 a.m. on the 8th instant, and the patient is now under treatment.

There have been fatal cases of cholera at Takeshita Mura, Enshu, and Ushifuka Mura, Kumamoto.

The *Hochi Shimbun* states that a very disastrous fire occurred at Hirakawa-cho, Sancho, Kojimachi, Tokio, not far from the British Legation, on the 8th instant. The flames were first noticed at about 6 p.m. and spread rapidly owing to the fresh north-westerly wind that was blowing at the time. The conflagration was not extinguished until the whole of the first, so-

cond and third, and half of the fourth, fifth and sixth wards of Hirakawa cho were destroyed, and also the whole of Yamamoto cho and Moto Hirakawa-cho. In all, three hundred and forty houses were burnt down before the conflagration was got under, at about ten o'clock p.m.

The following table, compiled from native sources, shows the number of counties, streets, and villages, in the different Fu and Ken in Japan:—

Fu and Ken.	Number of Counties.	Number of Streets.	Number of Villages.
Aichi.....Ken	18	364	1,944
Akita .....	9	294	913
Awamori .....	8	6	828

Yamanashi .....	9	37	286
Total.....	693	10,367	53,577

The island of Yesso, which is under the jurisdiction of the Colonial Department, and the new prefecture of Okinawa (Loochoo) are both excepted, probably on account of the statistical reports for those two places not being yet completed.

We have the following further particulars relating to the fire at Hirakawacho, Kojimachi, Tokio, on the 8th instant. The locality being near to the Imperial palace, the Princes of the Blood, the Prime Ministers, the Privy Councillors, and other high dignitaries visited the palace on the same night to inquire after the health of His Majesty the Emperor. The total number of houses destroyed is 392, and 14 were damaged. One boy of seven years and a girl of five years old lost their lives during the conflagration. The Hirakawa-Gakko (school) has provided shelter for those burnt out, and several people have subscribed different amounts of money for the relief of the sufferers.

A Chinese class of the Ko-a-kwai (Society for the restoration of Asia) in Osaka, was to be opened on the 10th instant. A Chinese teacher has been engaged, and the Chinese class already established by the Osaka Fuchō authorities is to be connected with the new class.

The Fujikawa, on the Tokaido, overflowed the other day in consequence of the snow melting on the mountains, and traffic was suspended.

A medical school has been established in the prefecture of Okinawa (Loochoo) at the suggestion of the military medical officers despatched from the Kumamoto garrison, and some native physicians. About fifty doctors joined in the proposal.

A steamer which left Yokohama on the 10th instant for the Ogasawara (Bonin) Islands, had a number of emigrants on board. Hitherto a vessel used to visit the said islands only twice a year, but it is now proposed that a regular line of vessels shall hereafter be despatched at short intervals.

A letter from Corea published in the *Hochi Shimbun*, says:—“An English man-of-war suddenly arrived at the port of Fusan in the afternoon of the 21st of last month, and many officers landed and walked about through our settlement, where they

were entertained at our Consulate. They returned on board their ship in the evening. The man-of-war was going to Hakodate from China, and on her way called at Fusan, but it is supposed by many that the visit is with some ulterior purpose. When the vessel first made her appearance off the coast, sailing under the English flag, the Koreans became dreadfully frightened, and some of them hastened to Tokinckifu, whipping their horses to full speed, so as to carry the news of the arrival of a foreign ship as early as possible. The Governor, fearing that something would occur, as in the case of an American ship which arrived here lately, immediately collected all the available forces from the neighbouring localities, and marched the same night as far as the coast of Fusan. Great confusion has been the result.”

The *Mainichi Shimbun* says, “it is said that many members of the Bishisha at Kochi, in the province of Tosa, are travelling in different parts of the country, some disguised as teachers, and others as medicine-sellers.”

The same paper states:—“We hear it as a rumour that a telegram, despatched from Fukuoka, and dated 1.35 p.m. on the 9th instant, was received by a certain influential person, to the effect that the people in that prefecture had risen in revolt, but we cannot answer for the truth of the report.”

### THE SPRING RACES.

FIRST DAY—MONDAY, 7TH JUNE.

At length we have the satisfaction of seeing all racing difficulties and disagreements definitely settled. The Nippon Race Club has sprung into existence, and if the success of the first day's meeting may be taken as a measure of the progress already made by the newly inaugurated body—then may we hope for a return of the enjoyable Spring and Autumn gatherings of former years. For four or five days past the weather had been all that could be wished, but on Saturday it was somewhat gloomy, and an earthquake occurring during the afternoon, the weatherwise—after Japanese meteorologists—predicted a succession of rainy days. Sunday was specially fine,—sunshiny and calm, but during the night a change took place and the rain came down in torrents, accompanied by a strong S. E. wind. Monday morning broke with the same weather, and the Committee decided to postpone the running; but scarcely had their resolution been announced than the wind suddenly drew round to the north, and in place of rain and dirty weather a glorious blue sky and sun appeared. This compelled a reversal of

the postponement, and it was accordingly agreed that the meeting should come off as originally intended. The weather continued fine throughout the afternoon, and with the exception of a rather inconvenient strong southerly wind, was all that could be desired. A good many ladies were present, and a number of Foreign, Japanese and Chinese officials. A Japanese military band performed during the afternoon.

1.—THE CLUB STAKES.—Value \$150. Second pony to receive 50 per cent. of entrance fees. For Japan Ponies, *h-mā fide* Grallins that have never run in a Race in Tokio or Yokohama. Weight as per scale. Five furlongs. Entrance, \$10.

Mr. John Peel's <i>Warlock</i> , 10st. 4lbs.....	1
Mr. Ito's <i>Yamata</i> , 10st. 10lbs.....	2
Mr. Durand's <i>Paradise</i> , 10st. 6lbs.....	3
Mr. Sagara's <i>Shiba</i> , 10st. 2lbs.....	0
Mr. O'Kotchi's <i>Odaki</i> , 10st. 8lbs.....	0

For this race five came to the post. Before starting, *Odaki* bolted and got away about two hundred yards before he could be pulled up. Eventually a fair start was effected, with *Warlock* to the fore. Down to the home straight *Warlock*, *Yamata* and *Paradise* were all together, with the latter slightly leading. When about two hundred yards from the Judge's box all three swerved to the outside rails, *Warlock* eventually succeeding in securing a win by a neck. Time, 1 min. 28 sec.

2.—THE TRIAL PLATE.—Value \$150. For Half-bred Ponies that have never won a race in Tokio or Yokohama. Weight as per scale. Five Furlongs. Entrance, \$10.

Messrs. Iwashita & Angot's <i>Hokuse</i> , 10st.....	1
Mr. Matsumura's <i>Kien</i> , 10st.....	2
Mr. Matsumura's <i>Kicho</i> , 10st. 4lbs.....	3
Mr. Sagara's <i>Tekiro</i> , 10st.....	0
Mr. Matengata's <i>Toku</i> , 10st. 6lbs.....	0

After one false start the ponies got away fairly, *Hokuse* and *Toku* making the running. After a short spurt the cream (*Hokuse*) came away from his companion and won as he liked. Time, 1 min. 18 sec.

3.—THE YOKOHAMA CUP.—Value \$——. For China Ponies. Weight as per scale. One Mile. Entrance, \$5.

Mr. Geoghegan's <i>Chief Mongolian</i> , 10st. 11lbs.....	1
Mr. Kennedy's <i>Skeddadle</i> , 10st. 2lbs.....	2
Mr. Fischer's <i>Clover</i> , 10st. 5lbs.....	3
Mr. Osborn's <i>Bonny Doon</i> , 10st. 8lbs.....	0
Mr. Durand's <i>Daisy Chain</i> , 10st. 11lbs.....	0

Another false start for this event, *Bonny Doon* and *Chief Mongolian* getting away some distance before their jocks could stop them. At length the animals went fairly away, *Chief Mongolian* leading, with *Skeddadle* second. This order was maintained to the finish, with *Clover* a very close third. *Clover*'s jockey rode very badly, calling on his pony only for the last fifty yards. From the way the animal responded for the distance, many infer that better riding and judgment might have landed him in a better position. Time, 2 min. 17½ sec.

4.—THE RIKUGUNSHO CUP.—Value \$200. For Japan Ponies. Weight as per scale. One Mile. Entrance, \$5.

Count Diesbach's <i>Oyama</i> , 10st. 4lbs.....	1
Mr. Hijikata's <i>Minkogawa</i> , 10st. 10lbs.....	2
Mr. Durand's <i>Phoebe</i> , 10st. 4lbs.....	0
Mr. Sagara's <i>Kinsen</i> , 9st. 12lbs.....	0

For this race four came to the judge's flag, but *Kiosen* bolted twice before the ponies could be set a-going. *Kiosen* then swerved to the outer rails, and was followed by *Phoebe*. *Minkogawa* and *Oyama* raced together the whole way, the latter eventually scoring a win by a neck. Two fouls were claimed by the rider of *Minkogawa*, but after a hearing by the Committee, were disallowed. Time, 2 min. 21½ sec.

5.—THE SUMIDA STAKES.—Value \$150. For Half-bred Ponies. Weight as per scale. Winner of four or more races in Tokio or Yokohama, 7 lbs. extra. Three-quarters of a Mile. Entrance, \$5.

Count Diesbach's <i>Admiral Ronn</i> , 11st. 5 lbs. (7 lbs. extra).....	1
Messrs. Iwashita & Angot's <i>Bon René</i> , 10st. 6 lbs.....	2
Mr. Shinagawa's <i>Tsurugaike</i> , 10st. 2lbs.....	3
Mr. Carcano's <i>Nirkase</i> , 10st. 6lbs.....	0
Messrs. Iwashita & Angot's <i>Haken</i> , 10st. 4lbs.....	0

After the start this was apparently a match between the *Admiral* and *Bon René*. At the rounding into the home straight both were together, and the *Admiral*, after a tough struggle was landed a winner by a neck. A foul was claimed by the rider of *Bon René* but disallowed. Time, 1 min., 38 sec.

6.—THE DIPLOMATIC CUP.—Value \$250. For Japan and China Ponies. Weight as per scale. Winner of No. 3 or No. 4, 7 lbs. extra. Three-quarters of a Mile. Entrance, \$5.

Mr. Kennedy's <i>Skeddadle</i> , 10st. 2lbs.....	1
Mr. Durand's <i>Daisy Chain</i> , 10st. 11lbs.....	2
Mr. Geoghegan's <i>Kingfisher</i> , 10st. 11lbs.....	3
Mr. Hijikata's <i>Unguma</i> , 10st. 12lbs.....	0
Mr. Osborn's <i>Cynanure</i> , 10st. 5lbs.....	0

The ponies got away to a very bad start. *Skeddadle* and *Daisy Chain* came to the front and had the race to themselves. At the home straight the former came away and won as he pleased. Time, 1 min. 4 sec.

7.—THE NIPPON PLATE.—Value \$——. For Japan Ponies. Weight as per scale. Half a Mile. Entrance, \$5.

Count Diesbach's <i>Oyama</i> , 10st. 4lbs.....	1
Mr. Nikaido's <i>Miyako</i> , 10st. 6lbs.....	2
Mr. John Peel's <i>Annandale</i> , 10st. 8lbs.....	3
Messrs. Iwashita & Angot's <i>St. Elmer</i> , 10st. 4lbs.....	0
Mr. Durand's <i>Pagan</i> , 9st. 12lbs.....	0

Another bad start, but the event was *Oyama's* from the commencement, and none of the other ponies got near him. Time, 2 min., 1 sec.

8.—THE BANKERS' CUP.—Value \$——. For Japan Ponies; winner of No. 4 or No. 6 excluded. Weight as per scale. Three-quarters of a Mile. Entrance, \$5.

Mr. Sagara's <i>Kien</i> , 10st. 4lbs.....	1
Count Diesbach's <i>Jim Hills</i> , 10st. 4lbs.....	2
Mr. Hugo's <i>Katerfelto</i> , 10st. 4lbs.....	3
Mr. Matsumura's <i>Shiratori Taki</i> , 10st. 2lbs.....	0
Mr. Hijikata's <i>Minkogawa</i> , 10st. 2lbs.....	0
Messrs. Iwashita & Angot's <i>Satsuma</i> , 10st.....	0

For this race six came to the flag: *Jim Hills* (who was led out unmounted) broke away from his custodians and went once-and-a-half round the course riderless before he could be stopped. At length the ponies were got off with the runaway leading, but in the straight *Kien* came to the fore, and after a short trial of speed came away and won easily. *Katerfelto* third. Time, 1 min., 43½ sec.

## SECOND DAY—TUESDAY, 8TH JUNE.

The weather yesterday was splendid, and, with the exception of a little too much wind and consequently dust, visitors to the course found it enjoyable. We were glad to notice a great increase in the number of ladies present, but this is easily explained, as the prize *par excellence*, the Ladies' Purse, was competed for yesterday. We trust at the Autumn Meeting the Committee will have seen their way to provide more fitting accommodation for the fair visitors who crowded the Grand Stand and witnessed the victory of the *Chief*. There was a goodly sprinkling of local notables among the spectators yesterday, and we were pleased to see that the meeting continues to interest the native gentlemen, many of whom were again present. To-day the weather is beautiful for racing, and we hope to see a large assemblage to bring the first meeting of the new Club to a close with fitting *clat*. So far the racing and arrangements reflect the highest credit upon every member of the Club actively connected with the meeting, the only persons who have cause to grumble being the Book-makers who suffered from yesterday's boil-over, but then the public benefited, which is probably a more satisfactory state of things.

1.—THE TEA CUP.—Value \$——. For Japan Ponies that have never won a race in Tokio or Yokohama. Weight as per scale. Five Furlongs. Entrance, \$5.

Mr. Durand's <i>Paradise</i> , 10st. 6lbs.....	1
Mr. Ito's <i>Yamata</i> , 10st. 10lbs.....	2
Mr. Durand's <i>Pagan</i> , 9st. 12lbs.....	3
Mr. Sagara's <i>Shiba</i> , 10st. 2lbs.....	0
Mr. O'Kotchi's <i>Odaki</i> , 10st. 8lbs.....	0

For this event five came to the starting post. After some trouble a bad start was effected, *Paradise* being somewhat in advance. This continued to the home straight, when *Paradise* further increased his lead and won as he pleased. Time, 1 min. 22 sec.

2.—THE SHIMOSA CUP.—Value \$150. For Half-bred Ponies. Weight as per scale. Half a Mile. Entrance, \$5.

Messrs. Iwashita & Angot's <i>Hokuse</i> , 10st.....	1
Count Diesbach's <i>Warwick</i> , 10st. 10lbs.....	2
Mr. Matengata's <i>Toku</i> , 10st. 6lbs.....	3
Mr. Matsumura's <i>Kicho</i> , 10st. 4lbs.....	0
Mr. Sagara's <i>Tekiro</i> , 10st.....	0
Mr. French's <i>Nirkase</i> , 10st. 6lbs.....	0
Messrs. Iwashita & Angot's <i>Asaguro</i> , 10st.....	0

For this event a field of seven came out to contest the prize. *Nirkase* took it into his head to play runaway for his own edification, and before he was pulled up had managed to go twice round the course. At length a start was effected, *Warwick* jumping off with the lead. In the

straight run to the winning post, *Hokuse* challenged the leader, and after a game struggle came in a length ahead of the brown. Time, 62 secs.

3.—THE SILK CUP.—Value \$——. For China Ponies. Winners at this meeting, 7 lbs. extra. Weight as per scale. One Mile and a quarter. Entrance, \$5.

Mr. Fischer's <i>Clown</i> , 10st. 5lbs.....	1
Mr. Kennedy's <i>Skedaddle</i> , 10st. 9lbs. (7lbs. ex.)....	2
Mr. Osborn's <i>Bonny Doon</i> , 10st. 8lbs.....	3
Mr. Durant's <i>Daisy Chain</i> , 10st. 11lbs.....	0
Mr. Geoghegan's <i>Kingfisher</i> , 10st. 11lbs.....	8

This was one of the best races of the day, and among a certain party was considered a sure thing for *Skedaddle*. After three false starts the ponies got away badly, and on the first round *Skedaddle* led with *Kingfisher* second. On rounding the quarter post on the home stretch, the position was about the same, but from here *Clown's* jockey laid on the tickler, and by the time fifty yards from the Judge's box was reached, *Clown* came away and won easily from *Skedaddle*. Time, 2 mins. 55 secs.

4.—THE PRESS CUP.—Value \$——. For Japan Ponies. Weight as per scale. Winner of No. 7, first day, excluded. Half a Mile. Entrance, \$5.

Mr. John Peel's <i>Annandale</i> , 10st. 8lbs.....	1
Mr. Nikaido's <i>Miyako</i> , 10st. 6lbs.....	2
Mr. Durant's <i>Iryu</i> , 9st. 12lbs.....	3
Messrs. Iwashita & Angot's <i>St. Elmer</i> , 10st. 4lbs.....	0

This was an easy victory for *Annandale*; he led at start, and came in without an effort. Time, 61½ secs.

5.—THE MITSU BISHI CUP.—Value \$150. For Japan Ponies. Winner of No. 4, first day, 10 lbs. extra. Weight as per scale. One Mile and a quarter. Entrance, \$5.

Mr. Hugo's <i>Katerfelto</i> , 10st. 4lbs.....	1
Count Diesbach's <i>Oyama</i> , 11st. (10lbs. ex.).....	2
Mr. Hijikata's <i>Minkagawa</i> , 10st. 10lbs.....	3
Mr. Durant's <i>Phœbus</i> , 10st. 4lbs.....	0

For this event four ponies went to the judge's flag. *Katerfelto* led at the start and kept this position to the finish; *Oyama* a good second. Time, 50½ secs.

6.—THE LADIES' PURSE.—For China and Japan Ponies. Winner of No. 6, first day, excluded. Weight as per scale. Half a Mile. Entrance \$5.

Mr. Geoghegan's <i>Chief Mongolian</i> , 10st. 11lbs.....	1
Count Diesbach's <i>Oyama</i> , 10st. 4lbs.....	2
Mr. John Peel's <i>Annandale</i> , 10st. 8lbs.....	3
Mr. Osborn's <i>Cynanur</i> , 10st. 5lbs.....	0
Mr. Sagara's <i>Kioen</i> , 9st. 12lbs.....	0
Mr. Hijikata's <i>Ungum</i> , 10st. 12lbs.....	0
Mr. Ito's <i>Tawata</i> , 10st. 10lbs.....	0
Mr. Nikaido's <i>Miyako</i> , 10st. 6lbs.....	0
Count Diesbach's <i>Checkmate</i> , 10st. 11lbs.....	0
Count Diesbach's <i>Gled</i> , 10st. 2lbs.....	0

For this prize the largest field of the day came out. After a long interval and several false starts the ponies were at last set going, with the *Chief* a good three yards to his credit. The last named pony kept his position to the end, and came in an easy winner with hands down. Time 60½ secs.

After this race occurred the pleasantest episode of the meeting, when the rider of the *Chief* was led to the stand and the prize presented to him. When handing the whip and purse to Mr. Jenkins, Mue. von Stoetwegen expressed the pleasure she felt in doing so, and congratulated Mr. Jenkins in the name of the ladies. The winner returned thanks to Mue. von Stoetwegen and the ladies for their kindness, and mentioned that, although he had been riding races in Yokohama for some thirteen years, this was the first occasion on which he had been so fortunate as to win the Ladies' Purse. He then presented Mue. von Stoetwegen with a bouquet, and retired amid cheers for the jockey and the ladies.

7.—THE NAIMUSHO VASE.—Value \$——. For Half-bred Ponies. Winner of No. 5, first day, 10 lbs. extra. Weight as per scale. One Mile. Entrance, \$5.

Messrs. Iwashita & Angot's <i>Bon René</i> , 10st. 6lbs.....	1
Count Diesbach's <i>Admiral Kioso</i> , 11st. 8lbs. (10lbs. ex.).....	2
Mr. Matsumura's <i>Kino</i> , 10st. 9lbs.....	3

For this, *Kioso* the *Admiral* and *Bon René* started. *Kioso* jumped off with the lead, and retained the position for

half-a-mile. *Bon René* now came up level, with *Admiral* following, and at the home quarter both had passed *Kioso*. From here *René* galloped in an easy winner. Time, 2 min. 12 secs.

8.—THE FUJIYAMA CUP.—Value \$150. For Japan Ponies. Winners and non-competitors excluded. Weight as per scale. Three-quarters of a Mile. Entrance, \$5.

Count Diesbach's <i>Jim Hills</i> , 10st. 4lbs.....	1
Messrs. Iwashita & Angot's <i>Satsuna</i> , 10st.....	2
Mr. Durant's <i>Iryu</i> , 9st. 12lbs.....	3
Mr. Durant's <i>Phœbus</i> , 10st. 4lbs.....	0
Mr. Matsumura's <i>Shiratori Taki</i> , 10st. 2lbs.....	0

Seven came to the post, but before arriving there *Jim Hills*, preferring to go alone, threw his rider and took a preliminary gallop on his own account. After he was caught and taken to the start, he apparently made up his mind to pull off the race, for he came away from the rack and won with ease. Time, 1 min. 39½ secs.

### THIRD DAY—WEDNESDAY, 9TH JUNE.

So far as the weather was concerned the third day was the most enjoyable of the meeting. There was little or no wind, and an overcast sky that kept the temperature within bounds. A very large attendance was noticeable, including a number of Japanese officials, who appeared to enjoy the sport immensely. A native band again enlivened the afternoon's proceedings.

1.—THE HURDLE RACE.—Value \$150. For China and Japan Ponies. Weight as per scale. Once round and a distance. Entrance \$5.

Count Diesbach's <i>Gled</i> , 10st. 2lbs.....	1
Count Diesbach's <i>Checkmate</i> , 10st. 11lbs.....	0
Mr. Geoghegan's <i>Kingfisher</i> , 10st. 11lbs.....	0

For this three only came out. The race was a gift to *Gled*, who was over the first hurdle ahead, and took the remainder without a refusal. *Kingfisher* and *Checkmate* balked at the second barrier, and were never afterwards in the race. Time, 3 min. 15½ sec.

2.—THE JAPAN CONSOLATION.—For Ponies that have started and not won a race at the meeting. Value, \$100. Weight as per scale.

Messrs. Iwashita & Angot's <i>Satsuna</i> , 10st.....	1
Mr. Hijikata's <i>Minkagawa</i> , 10st. 10lbs.....	2
Mr. O'kouchi's <i>Odaki</i> , 10st. 8lbs.....	3
Mr. Durant's <i>Iryu</i> , 9st. 12lbs.....	0
Mr. Hijikata's <i>Ungum</i> , 10st. 12lbs.....	0
Mr. Nikaido's <i>Miyako</i> , 10st. 6lbs.....	0

After some delay the ponies got away, *Odaki* leading, *Ungum* second and *Satsuna* third. Turning the home corner the three challenged, when *Satsuna* galloped away and won by some lengths. Time, 1 min. 19½ sec.

3.—THE HALF-BRED CONSOLATION.—For Ponies that have started and not won a race at the meeting. Value, \$100. Weight as per scale. Five Furlongs. Entrance, \$5.

Messrs. Iwashita & Angot's <i>Aogaro</i> , 10st.....	1
Count Diesbach's <i>Warwick</i> , 10st. 10lbs.....	2
Messrs. Iwashita & Angot's <i>Hakra</i> , 10st. 4lbs.....	3
Mr. Shinagawa's <i>Tsurugaike</i> , 10st. 2lbs.....	0
Mr. Matsugata's <i>Tokin</i> , 10st. 6lbs.....	0
Mr. French's <i>Nirkese</i> , 10st. 6lbs.....	0

After several false starts the ponies got away fairly, and *Aogaro* rushed to the front. The others tried hard to get level but did not succeed, and *Aogaro* won by a length. Time, 1 min., 17½ secs.

4.—THE CHINA CONSOLATION.—For Ponies that have started and not won a race at the meeting. Value, \$100. Weight as per scale. Once round. Entrance, \$5.

Count Diesbach's <i>Checkmate</i> , 10st. 11lbs.....	1
Mr. Osborn's <i>Bonny Doon</i> , 10st. 8lbs.....	2
Mr. Geoghegan's <i>Kingfisher</i> , 10st. 11lbs.....	3

This was a splendid race between *Checkmate* and *Bonny Doon*. After the start the latter rushed to the front with *Kingfisher* second, *Checkmate* hard held going up the hill. At the top the latter was set a-going and came through to the front. This order was retained to the run in, when *Bonny Doon* again challenged the leader and they raced together down the straight. About a hundred yards from the judge's box *Checkmate* swerved to the outside rails, and it looked a dead certainty for *Bonny Doon*, but the former started off again and beat *Bonny Doon* on the post by half a length. Time, 2 min., 17½ secs.

5.—THE MIKADO'S VASE.—For Japan Ponies. Champion. Weight as per scale. One Mile. Entrance, \$10.

Mr. Sagen's <i>Kien</i> , 10st. 4lbs. ....	1
Count Diesbach's <i>Jim Hills</i> , 10st. 4lbs. ....	2
Mr. John Peck's <i>Annandale</i> , 10st. 8lbs. ....	3
Mr. Hugo's <i>Katerfelto</i> , 10st. 4lbs. ....	0
Mr. O'Kochi's <i>Odaki</i> , 10st. 8lbs. ....	0
Mr. Hijikata's <i>Minkajura</i> , 10st. 10lbs. ....	0
Mr. Ito's <i>Yasuta</i> , 10st. 10lbs. ....	0
Count Diesbach's <i>Ogawa</i> , 10st. 4lbs. ....	0

This, of course, brought out every Japanese owned horse that stood the slightest chance. A fair start was effected, and after the hill was negotiated, *Kien* came to the front and was never caught again. Time, 2 min. 17 secs.

The prize (two bronze vases) was presented to the winning jockey by H. E. Matsugata, Minister of the Interior, the pony at the same time being paraded in front of the stand. As may be expected, the much coveted prize going to a Japanese stable, the natives were very jubilant thereat, and jockey, owner and pony, came in for a large share of applause.

6.—THE GAIMUSHO CUP.—Value \$150. The winner to receive also 50 per cent of Entrance Fees. Handicap. For China and Japan Ponies. Once round. Entrance, \$10.

Mr. Geoghegan's <i>Chief Mongolian</i> , 11st. 8lbs. ....	1
Count Diesbach's <i>Gled</i> , 10st. 10lbs. ....	2
Count Diesbach's <i>Jim Hills</i> , 11st. ....	3
Mr. Osborn's <i>Donny Dunn</i> , 10st. 8lbs. ....	0
Mr. Hugo's <i>Katerfelto</i> , 11st. 2lbs. ....	0
Mr. Fischer's <i>Clown</i> , 11st. 2lbs. ....	0
Mr. Durants's <i>Daisy Chain</i> , 10st. 8lbs. ....	0

Before a fair start could be effected *Katerfelto* and *Gled* bolted, the former going round the course before he was stopped. When at length they were sent away, *Gled* led up the hill, but afterwards had to give place to the *Chief*. In the home straight *Gled* again came up and a splendid race ensued, the *Chief* winning by a head only. Time, 2 min., 14½ secs.

7.—THE HALF-BRED HANDICAP.—Value \$150. One Mile. Entrance, \$5.

Messrs. Iwashita & Angot's <i>Asaguro</i> , 10st. ....	1
Messrs. Iwashita & Angot's <i>Bon René</i> , 11st. 10lbs. ....	2
Count Diesbach's <i>Warwick</i> , 10st. 12lbs. ....	3
Count Diesbach's <i>Admiral Ross</i> , 12st. ....	0

The four above named started, *Asaguro* being declared by his owners to win if possible. After the start *Asaguro* took the lead and retained it up to the finish. Time, 2 min., 13 secs.

BETTOES' RACE.—Once Round. Weight 125 lbs.

<i>Annandale</i> .....	1
<i>Checkmate</i> .....	2
<i>Daisy Chain</i> .....	3
<i>Kingfisher</i> .....	0
<i>Cynnaur</i> .....	0

This was a Bettos' race on Chinese ponies and resulted in *Daisy Chain*, *Checkmate* and *Annandale* coming in together. After an interval of fifteen minutes the ponies were again set going, and *Annandale* won in a canter. A small boy, who was riding *Checkmate*, got a spill at the finish, but fortunately received no other injury than a pretty severe shaking.

#### EUROPEAN AND INDIAN TELEGRAMS.

Bombay, 26th April.—The *Times of India's* London correspondent telegraphs that Mr. Goschen has declined the Viceroyalty for domestic reasons.

Bombay, 29th April.—Simla telegrams announce that Lord Lytton leaves India in a fortnight. It is rumoured that Sir John Strachey has resigned, and will leave India shortly. There is considerable speculation at Simla as to the future policy of Government. The Horse Guards have protested against the rank of Lieutenant-General being conferred on Sir Frederick Roberts, without sanction from Home, in contravention of orders, such rank only being given after Royal sanction and approval.

Bombay, 28th April.—In consequence of an unexpected change in Afghan affairs, the reserve division of the Bombay troops is to be mobilized at once, and will be sent to the front when transport is available.

Simla, 5th May.—Lady Lytton remains at Simla, in General Robert's house, previously taken for the Maha-

rajah of Larbana, and does not accompany Lord Lytton home.

Allahabad, 5th May.—The *Civil and Military Gazette* says that a crore and a quarter of rupees has disappeared from the balances of the Punjab treasuries. There is no record whatever to show how it has been spent. General Massey has been appointed to command the Rawul Pindee Brigade.

London, 6th May.—Public opinion here is greatly excited by the astounding deficit that has been discovered in Sir John Strachey's Budget. The English Press has spoken out unanimously in severe condemnation, and Mr. Baxter has proposed a motion on the subject in the House of Commons. The *Times* declares that the whole blame of perpetrating this scandalous blunder rests with the Government of India, and especially with Sir John Strachey; and that the excuses offered are inadequate and puerile, and such as no Secretary of State for India could defend for a moment.

Chinese Gordon has been appointed Private Secretary to the Marquis of Ripon. The appointment is warmly approved.

London, 5th May.—Consols 99½. 5 per Cent. Rentes 118½ ex Coupon, Bar Silver 52 1-16. Four per Cent. 79. Four and half per Cent. 85½.

London, 6th May.—Arrival.—*Pekin*. Bank Shares:—Oriental Bank Corporation, £21 10s.; Chartered Bank, £23; Chartered Mercantile Bank, £22; Hongkong and Shanghai Bank, £36 10s.; Consols 99½, 5 per Cent. Rentes 118½. Bar Silver 52 3-16; Four per Cent. 78½; Four and half per Cent. 85. Exchange on India 60 days' sight 1s. 715.16.

The Bank Returns:—Reserve of Notes, £13,900,000; Bills discounted, £19,400,000; Bullion, £28,000,000; Proportion of Reserve to liabilities, 45 per cent.

London, 7th May.—The European Powers demand that Turkey should surround with its troops the districts in Albania which have risen in revolt, arising out of the delimitation scheme, which the Porte has ordered to be carried out, in accordance with the terms of the Berlin treaty.

Prince Orloff has returned to Paris from St. Petersburg, and resumed his duties as Russian Ambassador.

London, 7th May.—It is announced that the Irish measures to be brought before Parliament by the Government this Session, will be confined to the relief of the distress.

The Czar has refused his consent to a proposal of the Sultan that a commutation of the sentence of death passed on the assassin of Colonel Commernoff should be permitted.

London, 7th May.—The *Daily News*, in a leading article, says that the British Government has issued a Circular Note inviting the Great Powers to co-operate in the strict execution of the remaining obligations of the Berlin Treaty.

General Skobloff arrived at Tiflis on the 25th of April.

Mr. Fawcett, having accepted office under the new Ministry, presented himself to-day to his constituency at Hackney, when he said, after thanking them for his re-election, that the finances of India was the first question before the Government; that the erroneous estimate in Sir John Strachey's budget must be closely investigated and those responsible for it peremptorily called to account, and India must be aided to defray the Afghan war expenses.

London, 8th May.—The Marquis of Ripon, in reply to a deputation of the Indian Council at Downing-street, yesterday, said that as regards the question of education he should follow the lines of the Court of Directors' despatch of 1854.

The Board of Trade returns of Exports for last month show a decided improvement and a large increase in Imports.

The assassin of Colonel Commernoff has been sentenced to death.

London, 9th May.—Mr. Herbert Gladstone has been returned unopposed for Leeds. Colonel Gordon, R. E. has been appointed Private Secretary to the Marquis of Ripon, Lord William Beresford and Lieutenants Muir and Brett, Aides-de-Camp; Captains Foot and Fitzwilliam extra Aides-de-Camp, and Major White, Military Secretary.

London, 10th May.—The Marquis of Ripon starts from London on Thursday next.

Mr. Stanhope has refuted the statement made by Mr. Fawcett that the former Government knew of the erroneous estimate before the dissolution of Parliament. Mr. Fawcett

has admitted that he erred, and has withdrawn the statement.

London, 11th May.—The *Standard* publishes a paragraph stating that it is proposed to despatch a Committee of Enquiry into the system of administration of the finances of India. Sir R. Temple is to be a member.

Mr. Gladstone has written a letter to the Austro-Hungarian Ambassador, regretting his censure of the Austrian foreign policy, which was uttered in default of the assurance, now received that Austria has no desire to extend her rule to the Balkans.

#### THE AFGHAN WAR.

Ghazni, 29th April.—A report was received that a gathering of some or six or seven thousand men, chiefly Andarias and Sulaiman Khels, said to be Muski Alams' force, had collected near the village of Arzoolume, six miles south-east of camp. A brigade of infantry, six guns horse artillery and six mountain guns, with two regiments of cavalry, were despatched before daylight on the 29th, under Brigadier-General Palliser, to dislodge them. The position held by the enemy was, however, considered to be too strong to be carried by the force at General Palliser's disposal, and General Stewart brought up a reinforcement about 9 a.m. The enemy gave way and dispersed. Their loss is estimated at 400. Our loss is very trifling. No officers were wounded. More tribal gatherings are reported in the direction of Chaman and Arghestan district, which the local Afghan authorities were taking steps to disperse. Sirdar Alam Khan is likely to be made Governor of Ghazni provisionally.

Kabul, 23rd April.—This afternoon a salute of 21 guns was fired from the upper citadel of the Bala Hissar in honour of General Stewart's victory and the capture of Ghazni.

Bombay, 26th April.—Sir D. Stewart's victory has caused great satisfaction in England.

The barque *Seaforth* landed in Bombay on Saturday, sixteen of the crew of the steamer *Amelia* wrecked at the Laccadives.

Allahabad, 27th April.—The following particulars of the action at Charasiab are to hand :—

In consequence of the belief that the Logaris were assembling, Lieutenant-Colonel F. H. Jenkins got the Guides under arms an hour before daybreak. The camp was pitched east of Charasiab on the plain, and distant 1,300 yards from the nearest hills. Daybreak showed the enemy in number from 2,000 to 3,000, occupying the hills to the east of the camp with many standards planted. Large bodies of men were also seen coming from Zahidabad direction, and working round Charasiab under cover of the orchard. The camp was struck and all baggage was packed ready for removal. The enemy opened fire about seven o'clock, our troops at first lying under cover, and not replying. The Logaris showing in increased numbers, and several horses of the Guides and Artillery being hit, the baggage and guns were sent back beyond a nullah, near the hill captured by Major White, on the 9th October. A company of the 22nd, under Lieutenant J. P. Napier, and a half company of the Guides occupied the hill, the guns opening fire. After this position had been taken up, no more horses were hit. Three companies of the 92nd held the road to the south, parties of Guides occupying two ruined forts on the right flank, and checking the enemy in the orchards above Charasiab. Colonel Jenkins holographed news of the attack, and General Macpherson was sent out with a wing of the 92nd, the 45th Sikhs, three companies of the 2nd Goorkhas, four guns of Swinley's mountain battery, 2 guns of a screw battery, and a squadron of the 3rd Punjab Cavalry. General Gough followed with guns of the F. A. escorted by a wing of the 28th Punjab Infantry, and a squadron of the 9th Lancers. Two squadrons of the 17th Bengal Cavalry were to act in support. Jenkins held his own easily until General Macpherson's arrival at noon. A general advance was then made, the 2nd Goorkhas clearing the orchards of the Logaris, who took to flight, making for the hills on the east and west of the Kushi road. The Guides Cavalry pursued for four miles killing thirty stragglers, while the guns shelled the hills. The enemy's dispersion was apparently complete. Their loss was estimated at 100 killed and many wounded. The whole of the troops returned quietly to Bala Hissar during the day. The forts about Kabul, and the block-houses at Sherpur were manned

by the Garrison, as rumours were floating about of the hostile intentions of the Kohistanis.

Simla, 27th April.—There are reports that General Ross was engaged on Sunday and beat off the enemy, inflicting considerable loss. All accounts agree that the enemy lost heavily on the 25th at Charasiab. The number of killed and wounded vary from 400 to 700. The tribes are still excited in Kohistan and the neighbourhood.

Allahabad, 29th April.—In the action of the 20th, the Guides lost four killed, twenty-one wounded and had thirty-two horses put hors de combat. This is due to the fact that Colonel Jenkins had kept his sowars exposed to the Logaris' fire, to be ready to repel any rush upon his position as he had not enough infantry to form a reserve. The Logaris had breechloaders, and it is believed some Martinis among the number, as Martini bullets dropped among our men. Many sepoy of the Ameer's regiments were engaged at Argandeh, when news of the action arrived. Every man turned out armed, and took possession of Kotah-i-Takht, while messengers were sent to gather together the people of Maidan. When the result of the fight was known, the men dispersed, but have been restless since, and many have sent their families away, buried their treasure, and made preparations for renewed fighting. There is no doubt that great and increasing excitement exists among various sections of the tribes about Kabul, which is due to the movements of our troops at Ghazni, and to the absence of General Ross's force from Kabul. It is believed that the tribes adjoining Khurd Kabul are combining with a view of attacking our outposts on the line of communication. General Arbuthnot's movable column is in consequence to be concentrated at Jugdulluk.

Kabul, 26th April.—Yesterday at daybreak Colonel Jenkins was attacked near Charasiab. He reported that he was hemmed in by a much superior force and had with him the Guide's Wing, the 92nd Highlanders under Major White, two guns F.A., and about 1,000 men all told. General Macpherson started from Sherpur at half past nine in support with a detachment of the Goorkhas, the rest of the 92nd and 44th Sikhs, and four guns of Swinley's Mountain Battery. General Hugh Gough followed in reserve with four guns Field Artillery, six companies of Infantry, three Squadrons of Cavalry, of which one was the 9th Lancers. At about one o'clock General Macpherson debouched into the plain of Charasiab. Colonel Jenkins' baggage was posted for safety and shelter on a bluff to the left of our advance, and further on was a steep rocky hill, and the same side the valley was held by the enemy. Below in the plain was Colonel Jenkins' force, his two guns in action firing from the summit. The Afghans, in a large semi-circle facing and extending to our right flank in the immediate front, whilst there were villages and orchards at the foot of rocky mountains to our right. The presence of the enemy was everywhere discernable by flags set in the ground, and presently by continuous puffs of smoke proceeding from the dry ditches which they lined and from little rifle pits and shelter trenches, also from the mud walls of the villages. Colonel Jenkins held his own, and kept them off. General Macpherson at once sent forward Goorkhas supported by Sikhs to our extreme right and they promptly engaged the enemy, the Highlanders holding the hillock in the plain on the left advance of the Goorkhas, and from thence pouring a steady fire into the line of Afghans in front of the villages. The Goorkhas, though warmly engaged, had not one single casualty. Our guns began shelling the villages and the 92nd rapidly advanced, on which the enemy broke and fled in all directions. The Goorkhas followed up the hills to the right. The Highlanders and a few Goorkhas entered the orchards of the villages and fired upon one village, which being immediately captured, the principal men were sent in as prisoners to Sherpur. General Macpherson then ordered part of the 92nd and Swinley's Battery up the ridge in front whence the fugitive enemy were further molested as they swarmed up the steep bare mountain opposite. The casualties of the Highlanders—one killed and eight wounded; our total loss was seven killed and 34 wounded. The Afghan loss was far heavier than ours. In the distance the Guides in the plain were seen executing effective charges on the flying enemy. The whole affair was a complete success and was over by half-past two. Another action was fought near Ghazni on the 22nd, when General Stewart defeated

the enemy. The Afghan forces, six thousand strong, are supposed to have been raised by Musky Alam.

Simla, Sunday night.—Letters were received on the 29th April at Cabul from General Ross. On Sunday (25th) a large number of the enemy, estimated at one thousand to fifteen hundred, collected on the hills near the camp and fired into it. They were dislodged from the hills with the loss of forty killed. Our loss is one Goorkha killed, and three Goorkhas and a private of the Ninth Foot wounded; all slightly. The roads through Maidan and Logar are still infested by gangs of Ghuzis and marauders, who stop and search all passengers. The conference of Ghilzai chiefs at Sizni is said to have come to a peaceful decision. General Stewart has sent the Ghazni field force under General Hughes through the Logar Valley to open up communication with Cabul, Sir Donald himself marching with General Ross's force and expecting to reach Cabul on the 2nd May. He was at Arghandeh on the 1st. His main force encamped near Maidan. The Logar people sent a deputation to General Hughes, offering every assistance and claiming his protection. The Logar Valley is reported to be quiet. Musa Khan and Muhammad Jan are said to have arrived at Ghazni, and Abdul Rahman is said to be still at Kunduz. The combination in the Kunar valley is reported to be broken up for the present.

Simla, 30th April.—The Government of India have sanctioned General Massy's being reinstated in a brigade command in India, posting him to the Rawul Pindie Brigade, the most coveted Punjab brigade. It is rumoured that the Horse Guards dissented from the Commander-in-Chief's censure.

Allahabad, 1st May.—Abdul Rahman, it is stated, has written a conciliatory letter to the representatives of the British Government at Cabul. The letter was brought to Cabul on the 19th of April, at four p. m., by Mir Gholam Hyder, son of Gholam Jan, Khuja Imam Jan, of Parwen, brother of Mir Butcha, and other leading Kohistanis, whom Abdul Rahman deputed. The Sirdar writes professing himself the servant of the British Government, and states he is proceeding to Cabul to tender submission. He trusts the Government will not deem him an opponent on account of his long residence in Russian territory. That the Russian Government have not given him any help whatever either in money or men, but that he received money from the Ameer of Bokhara; that he left Russian territory of his own accord and responsibility; that the Turkistan people, including the resident Kohistanis, Logaris, and others, with remnants of the late Ameer Sher Ali's army, have already acknowledged him as sovereign. He then reiterates his readiness to comply with the wishes of the Government, and it appears, although his statement on this point is not sufficiently explicit, that he raises no protest against the sovereignty of certain districts of Afghanistan. He also expresses the conviction that the people of Turkistan generally will gladly accept him as Ameer.

The letter was written at Khinjan, the other side of the Hindoo Koosh, half-way between the hill and Ghor, due south of the Kunduz. The passes leading from Khinjan to Charikar, which are the head-quarters of the Kohistani faction, will remain blocked with snow till about the middle of May, when it is expected that Abdul Rahman will cross over. It is also stated he has remitted part of the revenue due by the Turkistanis, saying that he would not claim anything before the settlement of the Ameer'ship.

Doubts are entertained as to the truth of the statement that Abdul Rahman put Gholam Hyder Khan to death. It is now alleged that Gholam Hyder Khan was condemned, but that Abdul Rahman spared his life at the last moment.

Simla, 4th, May.—With reference to Reuter's telegram to-day, regarding the cost of the Afghan war, the papers containing the full information of the facts, so far as is known to the Government, will be issued to you to-day. Sir Donald Stewart reached Cabul on the 2nd May, and assumed command. He reported that all was quiet at Ghuzni, and that the tribal gathering has dispersed and Musa Khan has returned to Ghazni, and is with Sirdar Muhammad Alam, who was appointed Governor by Sir Donald Stewart.

Allahabad, 4th May.—The names of the two Sirdars appointed to Kohistan are Wazirzade Afzul Khan, a resalder in our service, and Ibrahim Khan Bahadoor. Both were on Mr. Lepel Griffin's personal staff. It is believed, though

nothing has been said officially, that they will go to Kunduz there to interview Abdul Rahman. If the Kohistanis remain quiet and pass them onwards safely, we shall probably not send a force to Istalif and Charikar.

Kabul, 4th May. There is a report in the city that Mahomed Jan is back again in Ghuzni, and that Alam Khan, who it was thought would be able to keep order there, has been murdered. For some time past gatherings have been reported in Kohistan at various places. To-day's information seems to show that these forces have now mostly dispersed, and the outlook in that direction is much more peaceable. By way of taking precaution, Mir Butcha is said to have made the Hindoos buy up his land bordering on the Koh Daman at a price of Rs. 16,000 with the agreement that if hunted by the British the bond is to hold good, but that if he can come to terms he will return the money and take back the land. The Logar is reported quiet, as are also Arghandeh and Maidan.

Kabul, 5th May.—Abdul Wahab, who fled to Langar, in Wardak, has now returned to Arghandeh, his native village. Kila Haji and Tamma are reported as infested by Kohistani robbers, who are plundering all travellers. It is reported that all the near Kohistani gatherings have entirely broken up, Mir Said Khan going to Istalif, Sawar Khan to Parwan, and the minor chiefs and followers to their respective homes. Mir Butcha is reported as having gone from Baba Kuchi Kar to Farza, en route to Turkistan. The ryots of Khoja Mir Said and Mir Butcha are said to be in open mutiny, pointing out that they have suffered in the struggle with the British, but that their masters have only profited and are keeping the British money to themselves. They threaten to occupy all the Kotals towards Cabul and so bring back the British into the Koh Daman in revenge for their treatment. Sirdar Mahomed Ibrahim Khan and Resalder Mahomed Afzel Khan, have gone off to Turkistan on urgent business; and for the next fortnight all in that direction will probably be in a state of quiet expectancy.

Candahar, 6th May.—The Sirdar Shue Ali is still in the Argistan District and all the malcontents with some petty exceptions have made their submission to him, and he has raised about 150 recruits for his infantry regiment. The neighbourhood of Khelat-i-Ghilzai, is said to be generally quieting down though armed parties still hover about.

Cabul, 6th May.—The large bodies of the Kohistanis in the neighbourhood of Cabul have dispersed to their homes.

Letters of last Sunday, received from Sirdar Mahomed Alam Khan, Governor of Ghuzni, state all is well there and that Musa Khan had entered the city the same day.

Arrangements are being made for keeping open communication between Ghuzni and Cabul.

Large quantities of goods of private traders are lying at Jellalabad awaiting transport.

Cabul, 10th May.—News has been received from Alam Khan. He writes from Bad Mushk, three marches north of Ghuzni, that Musa Jan, Hasan Khan, and Gholam Hyder, are all in Ghuzni. All is peaceful there. He reports further that he has written to Zarnat, warning the people against listening to Mahommed Jan.

Cabul, 16th May.—Sir F. Roberts' force has destroyed Padishah Khan's forts at Sarkhab near Zarghanshahr. Padishah Khan has escaped to the hills. The force marches at once to Maidan, where it will remain for two or three weeks.

General Hills has been appointed to the command of the Ghuzni force now in Southern Logar.

The chief Political Officer has sent a letter to Mushk-i-Alam, asking him to help to maintain peace for the benefit of the country, and thus enable the British Government to bring about the more speedy settlement of affairs than otherwise will be possible. This appeal to the Moollah's patriotism may have a good effect, more especially as it is believed that the Mushk-i-Alam is not a party man.

Sirdar Alam Khan starts to return to Ghuzni to-morrow.

It is reported that the Moollahs are inciting the people of the Chipriar district, to the South of Jellalabad, to refuse payment of revenue, and to rise against the British.

In Lughman also, at the instigation of the Moollahs, the Governor's authority is set at defiance. Orders have been issued that the villages harbouring these Moollahs shall be fined by having to pay double revenue. If necessary, a small flying column will move through the Shinwari country.

Major Evan Smith leaves for Logar on special political

duty. Deputy Surgeon-General Smith is to arrive to-day from Logar to take charge of the office of principal medical officer to the Cabul Field Force.

From Simla it is reported, that Mr. C. E. Buckland, the Press Commissioner, has been appointed Superintendent of Stamps and Stationery, in succession to the late Mr. J. B. Roberts.

Gauhati, 17th May, 12th. 20m.—The steamer *Burmah* caught fire on anchoring here this morning. The fire was put out by the aid of the commanders and crews of the other vessels. The *Burmah's* crew tried to desert her, and were stopped by the captain with great difficulty. The force-pumps from the other vessels put out the fire. The local fire engine and officials arrived too late. Fortunately, very little damage has been done.

## ARRIVAL OF THE AMERICAN MAIL.

### TELEGRAMS.

Constantinople, May 12th.—There are some indications that the Sultan intends to have the sentence of death against the assassin of Colonel Commernoff carried out, and as a precaution he has dismissed the Bosnian members of the palace guards, fellow-countrymen of the assassin.

London, May 12th.—Rowell offers to compete with any American walker for from £500 to £1,000 a side, but says the international match between Brown, himself, Hart and Dobler, cannot be arranged at present, as Brown's backers are unable to leave England. He invites Hart, Dobler and others to England.

Paris, May 12th.—The Commission on the question of restoring the Palace of the Tuilleries has decided to restore it and convert it into a museum.

Cairo, May 12th.—In consequence of the recent arrival of a slave caravan at Siot, the Governor of the Province and other officials have been dismissed and will be court-martialled. A special European Commission has been appointed on the recommendation of the British Consul General, to secure the execution of the Anglo-Egyptian Convention for the suppression of the slave trade.

Vienna, May 13th.—The publication of Earl Granville's note and Gladstone's letter is much appreciated here. Lord Granville recently warmly assured Count Karolyi that the British Government was animated by the most sincere desire to cultivate friendly relations with Austria, and he expressed satisfaction at the Austro-German understanding.

London, May 13th.—The *Globe* says: We understand that, in view of complications with China, the Russian Government has telegraphed the authorities beyond the Ural Mountains to place all strategical roads in condition for the passage of troops and stores. Half a million of roubles has been assigned for improving the highway from Orenburg to Central Asia.

London, May 15th.—Three of the five missing boats of the mail steamer *American*, which foundered on the passage from Cape Good Hope for South Africa, were picked up on the 24th and 25th of April by American bark *Emma F. Harriman*, Captain Upton, from Accra for Winnebush, in latitude three degrees, thirty minutes north, and longitude nine west. The bark transferred the people to the steamer *Coanza*, which landed them at Grand Bassin. The British steamer *Senegal* took them aboard for Grand Canary island, on reaching which place the *Senegal* struck on a sunken rock, and was run ashore. All on board were saved, except John Paterson, who was drowned by the boat capsizing. News of the missing boats has been awaited with intense anxiety in London and at the Cape.

Berlin, May 15th.—Hundreds of parishes are without priests, and no new ones can be nominated until the Bishops are willing to submit the names of the candidates to the Government. It is, therefore, believed in Government circles that the Pope fears the power of the Papacy in Europe might be shaken by longer delay. To re-establish this power, the Pope is said to be willing to make, for the moment, some sacrifices, and also some important concessions. In this policy, however, the Pope will encounter resistance from the Jesuits.

London, May 16th.—The explosion at the Birchell's Hall Iron works, yesterday, was more destructive than at first reported. Twenty-five persons were injured.

St. Petersburg, May 16th.—There was a violent storm at Tiflis on the 14th instant. Rain fell in such torrents that the town and suburbs was flooded. Great damage was done to property.

Berlin, May 18th.—Letters from St. Petersburg express a belief that General Todleben, while staying at St. Petersburg, prior to assuming the Governor-Generalship of Wilna, will be consulted regarding the erection of fortifications at Vladivostok, and in the Amoor District generally. A vast amount of material is being shipped thither. Vessels belonging to the volunteer fleet now at Cronstadt, will shortly start for Vladivostok with a quantity of torpedoes. Several other vessels are being fitted out for a voyage to the Pacific. The possible

postponement of the Tekke expedition, in view of the threatened complications with China, is generally discussed in St. Petersburg. It is thought that General Skobeleff or Prince Imeretinsky will be appointed Commander-in-Chief on the Russo-Chinese coast. A well-accredited report is in circulation that an officer has left St. Petersburg with orders for General Skobeleff.

Dublin, May 18th.—Parnell was chosen sessional chairman at the Home-Rule meeting. It was suggested as a compromise between William Shaw and himself that Justin McCarthy be chosen chairman.

Paris, May 17th.—France will take the initiative in demanding from the Porte the acceptance of the International Commission supervision and administration for Turkey.

The labor strikes in the north of France are on the point of terminating.

An Oberammergau correspondent reports that the first performance of the *Passion Play* took place on Monday. Eight thousand persons were present. The representation was very successful. A large preponderance of those present were Americans and English.

Vienna, May 18th.—The Upper House of the Reichsrath adjourns this week. The Ministry will then resign, but Count Taaffe, President of the Council, with be intrusted with the reorganization of the Cabinet, and the coalition principle will be maintained.

Constantinople, May 18th.—Alarm has been produced in the British community by an attack on an Englishman named Burness, and two ladies walking in the suburbs, by three Mussulman robbers armed with knives. Burness was severely wounded and lies in a precarious condition. Two of the assailants have been arrested and will be court-martialled.

The Sultan hesitates to sign the death warrant of the assassin of the Russian Colonel Commernoff. The Fanatic party are making strenuous efforts to save him.

St. Petersburg, May 17th.—Twelve thousand men will be sent to the Amoor and 12,000 to Kuldja.

Cabul, May 18th.—Deserters from Herat report the city in a state of anarchy, Ayoub Khan a prisoner, and the troops mutinous for pay and oppressing the people.

London, May 18th.—Rev. B. Larabee, a well known American missionary at Oromiah, North Persia, where the famine chiefly prevails, writes: "Grain is selling at eleven times the ordinary rates. Rye has risen enormously, and people are living largely on scanty roots. Robberies are becoming alarmingly frequent. News from Kurdistan, received from the helpers among the mountain Nestorians, is equally distressing. From this city to the Tigris the famine is alike severe. May the Lord have mercy upon the land."

London, May 19th.—The *Times*, this morning, in an editorial on the Fortune Bay dispute, says: "The party, and, to a great extent, the statesmen, who were originally responsible for the Treaty of Washington, are now again in power in this country, and will not shrink from the task of amending it where there may seem need for amendment. The rights conferred by the Treaty, whether on American or British fishermen, are, as Everts contends, not exclusive, but common. The agreement suggested by Secretary Everts—that the contracting parties should, by some joint action, adopt regulations protecting the fisheries—would, at any rate, prevent future controversy; nor need there be any insuperable obstacle to an amicable adjustment of the present dispute."

London, May 19th.—Samuel Plimsoll, Liberal, has offered to resign his seat in Parliament for Derby in favor of Sir William Harcourt. Plimsoll's supporters decided to recommend the acceptance of his offer.

The result of the election for Wigton, by which J. McLaren, Liberal, was defeated by Mark Stewart, Conservative, is attributed to McLaren's alleged connection with figot houses and the disapproval of ultra-Presbyterians of the appointment of the Marquis of Ripon and Lord Kenmare to offices under the Crown, they being Roman Catholics.

It is stated that the Conservatives are determined to oppose the election of Sir William Harcourt at Derby. It is said that Sir Robert Peel will be invited to stand.

London, May 19th.—Henry Ashworth, a well-known manufacturer of Manchester, and a prominent Cobdenite politician, died at Florence, Italy, of Roman fever.

Rome, May 19th.—Almost complete results of the election for members of the Chambers of Deputies show the return of 120 Constitutionalists, 173 Ministerialists, and 61 of the Dissident Left. The second ballots are expected to make these figures 175, 249 and 82, respectively.

Blackburn, May 19th.—An unconditional resumption of work by the striking cotton operatives is expected.

London, May 19th.—Four hundred and fifty nobleman and gentlemen were present at a meeting of Conservatives at Bridgewater House to-day. Beaconsfield said that if the Conservatives were true to their principles, he looked forward to their return to power at no distant period. He considered it impossible for the present Ministry, with its discordant elements, to last long.

Cabul, May 19th.—Abdurrahman Kahn has dismissed his

army saying that he does not need it, having no present hostile intention against the British.

Berlin, May 19th.—The news from St. Petersburg confirms the report that the sentence of Chung How has decided Russia to recall her *Chargé d'Affaires* from Peking, and place her subjects in China under the protection of the United States.

London, May 20th.—A Paris despatch says: Goschen British Ambassador to Constantinople, while here, saw Premier de Freycinet, and several other politicians. He has gone to Vienna to interview Baron Haymerle, Austro-Hungarian Premier. It is affirmed that Goschen, without declaring himself as authorized to take the initiative in common action by the Powers for the establishment of an International Administrative Commission, has intimated that England would not hesitate to give hearty support, if, on the initiative of any Power, she were summoned to submit to the creation of such a Commission as was foreshadowed by the Berlin Treaty. Goschen's eagerness to confer with France and Austria, before going to Constantinople, indicate that the British Cabinet feels the urgency of ending a situation which may paralyze the best dispositions, and produce a disagreement of incalculable gravity. There is consequently every reason to believe that Turkey will shortly be summoned to give a categorical reply to the collective representatives of Europe.

Berlin, May 20th.—The leaders of the Centre, the Ultramontane party in the Prussian Diet, declare they are resolved to resist to the utmost the bill endowing the Ministers with discretionary powers relative to the execution of the May laws.

London, May 20th.—Parliament reassembled to-day. The Queen's speech refers to the cordial relations with all the Powers; hopes for the speedy execution of the whole of the Treaty of Berlin, and refers to the mission of G. J. Goschen in that connection. It says the efforts to pacify the Afghans and establish a strong and independent but friendly Government will be increased. The condition of India's finances, recently made known, will require special attention. A policy of confederation in South Africa, is advised, but the Transvaal will be retained. Imports and exports, and other signs, indicate the revival of trade, but the depression lately perceived in the Revenue, continues unabated. The estimates of income laid before the last Parliament will probably not be exceeded. The late season for convening the session, will seriously interfere with legislation. The Peace Preservation Act, in Ireland, will expire on the 1st of June, and will not be renewed. The loyalty and good sense of the Irish people justify reliance in the provisions of the ordinary law, firmly administered, for the maintenance of peace and order. The Acts for the mitigation of the distress in Ireland have been serviceable to that end. The question of the sufficiency of the advances authorized by those Acts is under consideration. A Burials bill, a Ballot bill, a bill to protect tenants against injury from ground game, a bill to determine the liability of employers for accidents to servants, and a bill for the extension of the borough franchise to Ireland, will be submitted to Parliament.

Lord Selbourn, Lord High Chancellor, read the speech. The House of Commons was crowded, but the attendance in the House of Peers was meagre.

In the House of Commons, John Power, Home Ruler, gave notice that he would offer an amendment to the address in reply to the Queen's speech, that the position of occupiers of land in Ireland deserves immediate attention, in order that their legitimate claims may be satisfied.

Sir Stafford Northcote, in debate on the address, dwelt upon the heavy responsibility of allowing the Peace Preservation Act to lapse, and earnestly hoped the result would justify the step. Generally, he approved the spirit of the speech, although he criticised some of its details.

Parnell and his immediate followers sit on the Opposition benches, Shaw and others on the Government side.

Parnell gave notice that he will call attention to the Parliamentary relations existing between England and Ireland.

Berlin, May 20th.—A bill has been introduced in the Diet, giving Prussia certain discretionary power in administering the Ecclesiastical laws. It contains the following enactment. The Prussian Ministry is authorized, with the consent of the King, to dispense with certain specified requirements of the laws relating to the training and appointment of the clergy, and further, to accord to the foreign clergy permission to perform their duties in the Prussian territory. Ecclesiastics who commit gross breaches of the laws will be proceeded against on the ground of incapacity. For these offences a conviction will entail loss of salary. A bishop expelled from his See may again obtain from the King official recognition as bishop of his former diocese. In the case of the vacant Catholic bishoprics the Government is empowered to confer Episcopal rights upon ecclesiastics who can show that they possess the mandate of the Church. Such persons will not necessarily be required to take the prescribed oath. The Government's grants which have been stopped may be restored by Ministerial decree, which, however, may be revoked. Prosecutions for offences against the May laws are to be instituted at the instance of the Governor of a province only. The Ministers of the Interior and Worship are empowered to

permit the creation of new branches of associations for tending the sick already existing in Prussia, and also to grant general authority, with the same liability to revocation, to sisterhoods whose present duties are confined to tending the sick, to undertake, also, the care and education of children who are unfit to attend school.

London, May 20th.—The Parnell Reception Committee has decided to hold a free Republic meeting at St. James' Hall on the 5th of June, to be followed by a great demonstration in Trafalgar Square.

London, May 21st.—Sir H. D. Wolff objected, in the House of Commons, to Charles Bradlaugh taking the oath, and amid much uproar, said his reason was that Bradlaugh was an Atheist, and had already infringed the terms of the oath in his book, "Impeachment of the House of Brunswick." On motion of Gladstone, the matter was referred to a select committee.

Rome, May 21st.—The Ministerialists and the Dissident Left have concluded a truce and will vote together at the second ballots for Deputies, to prevent the return of candidates of the Right. A coalition Cabinet, including the chiefs of the various sections of the Liberals, is considered probable.

Paris, May 21st.—Leon Say agrees to become a candidate for the Presidency of the Senate.

Madrid, May 21st.—The Minister of Foreign Affairs, to-day, said that no treaty of commerce with the United States is contemplated, and he thought it would be difficult to make one.

Plymouth, Eng., May 21st.—A portion of a vessel's stern, supposed to belong to the missing training ship, *Atlanta*, has been picked up on the Irish coast and handed over to the Admiralty.

Berlin, May 21st.—The newspapers publish an official communication saying that the Government, in introducing the new Church bill, offers to the Catholic clergy and the whole Catholic population the possibility of a *modus vivendi* very favorable to the Church. If the proffered hand is rejected, the fault will lie with the Ultramontanes. The Emperor is highly pleased with the new Church bill. He remarked that the bill bids fair to heal the difference between Church and State.

London, May 21st.—Vignaux won the first billiard match. Bennett scored only 575 points. In a subsequent match, Vignaux also won, Bennett scoring 82.

Paris, May 21st.—Gen. Gourlard has committed suicide, being tired of life from long ill-health.

Berlin, May 21st.—The proposals for a supplementary Congress to be held here meet with very little favor in high quarters. Bismarck is disinclined to again accept the unthankful office of Chairman.

London, May 21st.—Lord Beaconsfield writes to the *Times* entirely denying that he ever uttered a single word attributed to him in the reports of his speech at the Conservative meeting at Bridgewater House.

Vienna, May 21st.—Goschen, British Envoy to Turkey, to-day had an interview with Baron Von Haymerle, which lasted several hours.

London, May 21st.—In the House of Commons, Sir Charles Dilke said the Government would lay upon the table the whole correspondence between the Government and the United States and Canada.

Lord Hartington stated that the troops in Afghanistan would gradually be withdrawn as soon as a ruler was selected whose authority was likely to be permanent.

Lord Hartington confirmed the announcement of a deficit of £400,000 in the Indian Budget.

Grant Duff stated that Sir Bartle Frere would remain at the Cape.

In the debate on the report of the address, Forster said he had no reason to believe that landlords in Ireland would enforce their powers until they knew the result of the harvest. The report of the address was then agreed to.

Berlin, May 21st.—A daring burglary has been committed upon the King's secret cabinet at Stuttgart, and a number of valuable orders stolen.

## THE REPUBLICAN CANDIDATE FOR THE PRESIDENCY.

(By an intimate acquaintance.)

James Abraham Garfield was born November 19, 1831, in the township of Orange, Cuyahoga county, Ohio, about fifteen miles from Cleveland. His father, Abraham Garfield, came from New York, but, like his mother, was of New England stock. James was the youngest of four children. The father died in 1833, leaving the family dependent upon a small farm and the exertions of the mother. There was nothing about the elder Garfield to distinguish him from the other plodding farmers of the rather sterile township of Orange. No one could discern any qualities in him which, transmitted to the next generation, might help to make a statesman, unless it was industry; but his wife, who is still living at an advanced age, was always fond of reading when she could get leisure

from her hard household duties, and was a thoroughly capable woman, of strong will, stern principles and more than average force of character. Of the children no one besides James has made the slightest mark in the world. The older brother is a farmer in Michigan, and the two sisters are, I believe, farmers' wives. James had a tough time of it as a boy. He toiled hard on the farm early and late in summer and worked at the carpenter's bench in winter. The best of it was that he liked work. There was not a lazy hair on his head. He had an absorbing ambition to get an education, and the only road open to this end seemed that of manual labor. Ready money was hard to get in those days. The Ohio Canal ran not far from where he lived, and, finding that the boatmen got their pay in cash and earned better wages than he could make at farming or carpentry, he hired out as a driver on the tow-path and soon got up to the dignity of holding the helm of a boat. Then he determined to ship as a sailor on the lakes, but an attack of fever and ague interfered with his plans. He was ill three months, and when he recovered he decided to go to a school called Geauga Academy, in an adjoining county.

When he was twenty-three years of age he concluded he had got about all there was to be had in the obscure cross roads academy. He calculated that he had saved about half enough money to get through college, provided he could begin, as he hoped, with the junior year. He got a life insurance policy and assigned it to a gentleman as security for a loan to make up the amount he lacked. In the fall of 1854 he entered the junior class of Williams College, Massachusetts, and graduated in 1856 with the metaphysical honors of his class. I have seen a daguerreotype of him taken about this time. It represents a rather awkward youth, with a shock of light hair standing straight up from a big forehead, and a frank, thoughtful face, of a very marked German type. There is not a drop of German blood in the Garfield family, but this picture would be taken for some Fritz or Carl just over from the Fatherland.

Before he went to college Garfield had connected himself with the Disciples, a sect having a numerous membership in Eastern and Southern Ohio, West Virginia and Kentucky, where its founder Campbell, had travelled and preached. The principal peculiarities of the denomination are their refusal to formulate their beliefs into a creed, the independence of each congregation, the hospitality and fraternal feeling of the members, and the lack of a regular ministry. When Garfield returned to Ohio it was natural that he should soon gravitate to the struggling little college of the young sect at Hiram, Portage county, near his boyhood's home. He became professor of Latin and Greek and threw himself with the energy and industry which are leading traits of his character into the work of building up the institution. Before he had been two years in his professorship he was appointed president of the college.

During his professorship Garfield married Miss Lucretia Rudolph, daughter of a farmer in the neighborhood, whose acquaintance he had made while at the academy, where she was also a pupil. She was a quiet, thoughtful girl, of singularly sweet and refined disposition, fond of study and reading, possessing a warm heart and a mind with the capacity of steady growth. The marriage was a love affair on both sides and has been a thoroughly happy one. Much of General Garfield's subsequent success in life may be attributed to the never-failing sympathy and intellectual companionship of his wife and the stimulus of a loving home circle. The young couple bought a neat little cottage fronting on the college campus and began their wedded life poor and in debt, but with brave hearts.

In 1859 the college president was elected to the State Senate from the counties of Portage and Summit. He did not resign his presidency, because he looked upon a few months in the Legislature as an episode not likely to change the course of his life. But the war came to alter all his plans. During the winter of 1861 he was active in the passage of measures for arming the State militia, and his eloquence and energy made him a conspicuous leader of the Union party. Early in the summer of 1861 he was elected colonel of an infantry regiment (the Forty-second) raised in Northern Ohio, many of the soldiers in which had been students at Hiram. He took the field in Eastern Kentucky, was soon put in command of a brigade, and by making one of the hardest marches ever made by recruits surprised and routed the rebel forces, under Humphrey Marshall, at Picketon.

From Eastern Kentucky General Garfield was transferred

to Louisville and from that place hastened to join the army of General Buell, which he reached with his brigade in time to participate in the second day's fighting at Pittsburg Landing. He took part in the siege of Corinth and in the operations along the Memphis and Charleston Railroad. In January, 1863, he was appointed Chief of Staff of the Army of the Cumberland and bore a prominent share in all the campaigns in Middle Tennessee in the spring and summer of that year. His last conspicuous military service was at the battle of Chickamanga. For his conduct in that battle he was promoted to a Major-Generalship.

The Congressional district in which Garfield lived was the one long made famous by Joshua R. Giddings. The old anti-slavery champion grew careless of the arts of politics towards the end of his career and came to look upon a nomination and re-election as a matter of course. His over-confidence was taken advantage of in 1858 by an ambitious lawyer named Hutchins to carry a convention against him. The friends of Giddings never forgave Hutchins, and cast about for a means of defeating him. The old man himself was comfortably quartered in his Consulate at Montreal and did not care to make a fight to get back to Congress. So his supporters made use of the popularity of General Garfield and nominated him while he was in the field without asking his consent. That was in 1862. When he heard of the nomination Garfield reflected that it would be fifteen months before the Congress would meet to which he would be elected, and believing, as did every one else, that the war could not possibly last a year longer, concluded to accept. I have often heard him express regret that he did not help fight the war through and say that he never would have left the army to go to Congress had he foreseen that the struggle would continue beyond the year 1863. He continued his military service up to the time Congress met.

On entering Congress, in December, 1863, General Garfield was placed upon the committee on military affairs, with Schenck and Farnsworth, who were also fresh from the field. He took an active part in the debates of the House and won a recognition which few new members succeed in gaining. He was not popular among his fellow-members during his first term. They thought him something of a pedant because he sometimes showed his scholarship in his speeches, and they were jealous of his prominence. His solid attainments and amiable social qualities enabled him to overcome this prejudice during his second term, and he became on terms of close friendship with the best men in both houses. His committee service during his second term was on the ways and means which was quite to his taste, for it gave him an opportunity to prosecute the studies in finance and political economy which he had always felt a fondness for. He was a hard worker and a great reader in those days, going home with his arms full of books from the Congressional Library and sitting up late at nights to read them. It was then that he laid the foundations of the convictions on the subject of national finance which he has since held to firmly amid all the storms of political agitation. He was renominated in 1864, without opposition, but in 1866 Mr. Hutchins, whom he had supplanted, made an effort to defeat him. Hutchins canvassed the district thoroughly, but the convention nominated Garfield by acclamation. He has had no opposition since in his own party. In 1872 the Liberals and Democrats united to beat him but his majority was larger than ever. In 1874 the Greenbackers and Democrats combined and put up a popular soldier against him, but they made no impression on the result. The Ashtabula district, as it is generally called, is the most faithful to its representatives of any in the North. It has had but four members in half a century.

In the Fortieth Congress General Garfield was chairman of the committee on military affairs. In the Forty-first he was given the chairmanship of banking and currency, which he liked much better, because it was in the line of his financial studies. His next promotion was to the chairmanship of the appropriations committee, which he held until the Democrats came into power in the House in 1875. His chief work on that committee was a steady and judicious reduction of the expenses of the government. In all the political struggles in Congress he has borne a leading part, his clear, vigorous and moderate style of argument making him one of the most effective debaters in either house.

When James G. Blaine went to the Senate, in 1877, the mantle of Republican leadership in the House was by com-

mon consent placed upon Garfield, and he has worn it ever since. In January last General Garfield was elected to the Senate to the seat which will be vacated by Allen G. Thurman on the 4th of March, 1881. He received the unanimous vote of the Republican caucus, an honor never given to any man of any party in the State of Ohio. Since his election he has been the recipient of many complimentary manifestations in Washington and in Ohio.

As a leader in the House he is more cautious and less dashing than Blaine, and his judicial turn of mind makes him too prone to look for two sides of a question for him to be an efficient partisan. When the issue fairly touches his convictions, however, he becomes thoroughly aroused and strikes tremendous blows. Blaine's tactics were to continually harass the enemy by sharpshooting surprises and picket firing. Garfield waits for an opportunity to deliver a pitched battle, and his generalship is shown to best advantage when the fight is a fair one and waged on grounds where each party thinks itself strongest. Then his solid shot of argument are exceedingly effective. On the stump Garfield is one of the very best orators in the Republican party. He has a good voice, an air of evident sincerity, great clearness and vigor of statement and a way of knitting his arguments together so as to make a speech deepen its impression on the mind of the hearer until the climax is reached.

General Garfield is the possessor of two homes, and his family migrates twice a year. Some ten years ago, finding how unsatisfactory life was in hotels and boarding houses, he bought a lot of ground on the corner of Thirteenth and I streets, in Washington, and with money borrowed of a friend built a plain, substantial three-story house. A wing was extended afterwards to make room for the fast-growing library. The money was repaid in time, and was probably saved in great part from what would otherwise have gone to landlords. The children grew up in pleasant home surroundings, and the house became a centre of much simple and cordial hospitality. Five or six years ago the little cottage at Hiram was sold, and for a time the only residence the Garfields had in his district was a summer house he built on Little Mountain, a bold elevation in Lake county, which commands a view of 30 miles of rich farming country stretched along the shore of Lake Erie. Three years ago he bought a farm in Mentor, in the same county, lying on both sides of the Lake Shore and Michigan Southern Railroad. Here his family spend all the time when he is free from his duties in Washington.

General Garfield has five children living, and has lost two, who died in infancy. The two older boys, Harry and James, are now at school in New Hampshire. Mary, or Molly, as everybody calls her, is a handsome rosy-cheeked girl of about 12. The two younger boys are named Irwin and Abram. The General's mother is still living and has long been a member of his family. She is an intelligent, energetic old lady, with a clear head and a strong will, who keeps well posted in the news of the day and is very proud of her son's career, though more liberal of criticism than of praise.

#### THE JAPANESE PRESS.

#### ON THE RIGHT TO HOLD PUBLIC MEETINGS.

(Translated from the *Nichi Nichi Shimbun*.)

THE most important privileges necessary to the possession of freedom, are the right of holding public meetings to discuss political subjects and the freedom of the press, and these must be secured by the people of this country. In a country, ruled by a constitutional monarchy, the inhabitants select their representatives, who are authorized to take part in political affairs. Thus the people entrust their rights into the hands of their representatives, and observe an implied stipulation that they should not interfere in political matters themselves, but at the same time it is their right and privilege to discuss the advantages and disadvantages of current political questions at public meetings and in the newspapers. This is the reason why we call those two privileges the important rights by which the people can freely govern themselves. Now, in our country, we live under a beneficent sovereign, so that although there are laws restricting lectures and debates, we have freedom of speech, so far as it is not considered prejudicial to the peace of the country. Thus we are

possessed of the important rights by which we can freely regulate our conduct, because the press law is not a machine to be applied for forbidding the expression of justifiable opinions, nor are the meeting regulations for preventing the peaceful discussion of political subjects within moderate bounds. As regards the liberty of the press, the advantages and disadvantages are very well known to the public, so that it would be of no use for us to comment any further upon the matter, but as to the privilege of holding public meetings, public opinion being troubled to discern its benefits and dangers, has not as yet arrived at a just conclusion. Moreover, the public have been so bewildered at the recently issued regulations respecting public meetings that we think it is now a proper time to treat of the questions involved.

Now the liberty of holding meetings is indeed an important right, which the people can manage in their own way, as long as a free constitution is in working order. For example, if the people wish to present a petition to the Government, or to send in a memorial to the Legislative body, or National Assembly, or to place some questions before the Government or the Senate, or to call the attention of the Government officers and the members of the Assembly to any particular matter, then if the circumstances of the case require the people to hold a meeting, they are certainly justified in doing so, their course being approved both by the justice of Heaven and the laws; therefore, even in a country, where the power of the Government is committed to the care of the representations of the inhabitants, a meeting held by the people under such circumstances, is not an infringement upon the province of their representatives. However, if the people act at their meetings in such a way as to bring undue pressure upon the Legislative or Executive officers, or to turn the administration or laws in other directions, or, trusting in the force of large numbers, attempt to coerce outsiders in any way, or, in extreme cases, if they hold their meetings very frequently, or on regular days in the same manner as a House of Assembly; then such meetings are prejudicial to the tranquillity of the public, trespass upon the rights of the National Assembly, and assume the authority of the representatives. Action of the kind mentioned would result in great public injury, and reduce the great principles of Constitutional Monarchy to confusion. In a country where a constitution is not yet in force, nor a National Assembly established, if the people initiate meetings which embody no principle of coercion or appeal by force, but are conducted under peaceful and moderate regulations from first to last, such meetings are indeed rightful privileges of the people which they possess for their guidance, and even though they may influence the administration by means of argument or petition, they do not infringe upon the rights of a National Assembly, nor assume the authority of representatives, because, as we have said, there is no Representative Assembly in the country.

There are many among the public who point out the dangerous tendencies of meetings, and they always take France for example, and say:—"The evil effect of the French Revolution arises from the unrestrained license of public meetings. At the commencement of the Revolution the clubs in France disturbed both the upper and lower Chambers of the National Assembly, and while the Revolution was going on, not a single day passed without a meeting being held. If the views of the Upper Chamber were opposed to those of the clubs, the persons comprising the meetings at once broke out into rebellion and forced their way into the Chamber, and by their violence interrupted the deliberations of the Chamber and gradually deprived the representatives of their rights. The consequence was that, while the influence of the clubs increased, the power of the Chambers decreased, until at last the representatives thought it as well to be guided entirely by the meetings, rather than the acknowledged rights of the Chamber. In this way the Government was ultimately overturned, and the people were thrown into the depth of misery and trouble. Those evils arose from the injurious effects of unrestrained public meetings." Ah! this is indeed a one-sided opinion! Now the causes of the French Revolution are so numerous that we cannot explain them in a few words. However, as we wrote the other day, "influence is not liberty,"\* and as the French people did

\* The *Nichi Nichi* contained an article under this heading.

not know the true meaning of this great principle, they commenced to exert their influence among themselves before they tried to establish their freedom. Is not this the true cause of the French Revolution? If so, the meetings were diverted to the improper purpose of extending the influence of the members: therefore the injurious consequences of the Revolution did not spring from the meetings. This is well illustrated by the case of a robber who takes shelter in a forest. Can we then say that the forest itself is injurious to the peaceful inhabitants? No, it is the robber who is concealed in it. Well, as regards the French Revolution; the King's Government was greatly troubled with financial difficulties, and forced by the righteous opinions of patriotic people, to call together the National Assembly. But as the Government placed no confidence in the representatives, the Assembly had no actual power, and consequently the warm promoters of the popular rights became very angry, and thought it improbable, and in fact impossible, to secure their rights and liberties through the unaided instrumentality of the National Assembly, and that it would be much better to seize the reins of Government themselves and depend upon the support of the public. That is how they commenced to establish their power, and the real cause of the Revolution. Is it not therefore a great wrong, to attribute the evil effects of the Revolution entirely to the clubs? The French statesman of that time were not wholly free from such a mistaken belief, therefore the Government established very strict laws for controlling meetings, so as not to allow the public, either directly or indirectly, to interfere in the administration of affairs, and the same laws continued until a very recent period. But was it not the fact that the Government could not control the Revolution?

The measures for carrying into execution any plan depending upon the power of the public, being independent of meetings, it is of course quite necessary, in order to preserve good order among the community, to avert the injurious effects of unrestrained meetings by means of laws, but as long as a meeting is conducted in a peaceful manner, we do not see any possible harm which can arise from it. Therefore it is wrong to prohibit such gatherings or to lessen their influence. This is the case even in a country where the people live under a constitutional monarchy, and commit their legislative power into the hands of representatives, and accordingly should be much more the custom in a state devoid of representative institutions. Here in Japan perfect liberty of meeting exists at the present day, provided the people, in conformity with their great rights and liberties, forward a petition to their sovereign, or supplicate the functionaries responsible for conducting political matters. We therefore wish our patriots to act peaceably, and regard their rights with great respect, so as not to give an opportunity to anyone to complain of the evil effects of their meetings.

### TREATY REVISION AND A NATIONAL ASSEMBLY.

(Translated from the *Akebono Shimbun*.)

Alas! the Japanese people now are situated in a sad and unhappy position! because although Japan is an independent Empire, yet it is poor and weak, when compared with the powerful states of Europe and America. If human nature was amenable to moral restraints, we should have no reason to grieve at our poverty and weakness, but the inhabitants of the world are all greedy beings, therefore it is unavoidable that the poor and powerless, when brought into contact with the rich and strong, are always oppressed and cannot obtain the full enjoyment of their rights. We can prove the truth of this position by referring to the *li* question now in dispute between Russia and China. This is so, but, notwithstanding our poverty and weakness, we have more than one thing to negotiate about with the strong nations, and of those the restoration of the judicial rights of Japan has the most important bearing.

Speaking theoretically, if a person visits his friend's house, and remains there even one single day, not only it is wrong for the guest to violate the family laws of his host, but he has to submit himself to them during his stay, and, if he wishes not to regulate his conduct by them, it would have

been much better for him not to have paid the visit at all. After having entered another person's house, if the visitor acts in a selfish and uncouth manner, everybody would then call him rude and boorish. Our proverb says, "when you enter into a country, you have to observe the laws of that country." how then does this differ from the case of foreigners residing in Japan? It is quite clear that they ought to observe our laws, and not to infringe our inherent rights. Notwithstanding the fact that they have such a responsibility upon them as to be called boorish and rude, when they behave badly, they never dream of obeying our laws, and apparently wish to continue their selfish, arbitrary, unreasonable and unlawful conduct for hundreds of generations. What is the reason for this? Simply because, as human nature is greedy, the strong oppress the weak. This then is the reason why we say Japan is in a sad and unhappy position. Regarding this, some of our brethren, considering our present misfortunes as unavoidable, and admitting many reasons for the foreigners' demands, assert that we should open the whole country to foreign residence, and grant these interlopers the right of holding possession of landed property. In exchange for these concessions we should then receive the restoration of the judicial rights of the country. Is not this a very degrading proposal?

Such a suggestion may have been the outcome of necessity, but we must say the idea would, in practice, be very prejudicial to the country, and, moreover, if there are among the high functionaries of state any who harbour such a cowardly proposal, then indeed have the misfortunes of Japan reached a climax. Let our readers look and see, who is the more cunning and wealthy, the Japanese or the foreigners? It is quite clear that the native is always inferior to the foreigner in both respects. In addition, we have a far more fertile soil here than is the case in foreign countries; our land is much cheaper, and our coolies, although they work as industriously as foreign labourers, receive much less wages. Such being the condition of affairs, if foreigners are allowed to purchase land, employ labour, and freely pursue farming and other industries in Japan, a very few years will see the whole country in the hands of foreigners, and our beloved land will have passed away into the possession of the stranger. Alas! any one who makes such a proposal may be willing to reduce our thirty-five million brethren to the wretched condition of the labourers of British India, or the tenant farmers of Ireland. As we have already remarked, Japan is in a sad and unfortunate situation, but the spirit of freedom has never disappeared from among us, nor has our righteous patriotism ever been quenched. How then can the people of Japan brook the contemplation of any such miserable future for their country? Do we not recollect that, when one or two newspapers suggested the introduction of foreign capital, and the granting to foreigners of the privilege of holding land, public opinion was unanimously opposed to such a proposition, and suppressed all further mention of it for the time being?

It is true that anyone who suggests a means for the restoration of our sovereign rights in exchange for some privileges to be granted to foreign residents, may reason in the following way:—"It is approved by common sense that, if a person wishes to benefit himself, he has to benefit others as well, at the same time, and if any one wishes to induce others to submit to his regulations, without benefiting them, how can he reasonably expect them to do so? Now to restore the judicial rights of Japan is to benefit the Empire, while to grant the privilege of holding land to foreigners, is a benefit to them. How then can there be any reason under heaven that will justify us in expecting the restoration of our judicial rights, without giving some equivalent in exchange?" What an inconsistent observation! We know that we are acting according to a moral and just principle, and that we have no selfish interests at stake like the foreigners. How then can we be accused of desiring to benefit ourselves alone?

The foreigners who come to our country reap enormous profits in their mercantile transactions with us, but, being protected under the powerful shield of extra-territoriality they act in a selfish and rude manner. We find our rights and privileges invaded by them, and we fear them as we fear a poisonous serpent. We ask our readers is not this the case? It is plainly to be seen that a very unfair advantage is now on the side of the foreigners, and we only desire to restore our judicial rights, so that we shall be on an equal footing with them. Foreigners coming to our country

derive a benefit from our trade and commerce: therefore they should, on every principle of fair dealing, be governed by our commercial laws. They possess the advantage of freely associating with our countrymen, and it follows that they should be subject to the laws governing our community. If a foreigner murders a Japanese, he ought to be punished according to our law respecting the punishment of a murderer. Justice ought to be administered in this way, and why then should we be required to grant any particular privileges to foreigners in exchange for our undeniable rights? How can we be said to act selfishly when we advocate the enforcement of the unquestionable prerogatives of every independent sovereign state?

As we are, however, at present placed in a sad and unhappy situation, there may be a reason why the argument we have adduced should be only spoken of, but not put into operation. We must therefore wait until the time comes when we shall be enabled to carry our views into force, and when that time comes we ought not to resort to such a cowardly measure as to seek the recovery of the judicial rights of the Empire by granting foreigners in exchange the privilege of holding land in Japan. When will the happy day arrive for the enforcement of our rights? When we become possessed of sufficient power and knowledge to prevent any rude and powerful strangers from committing acts of violence, and to frustrate the schemes of foreigners, no matter how cunningly planned. The day when this will be achieved is one for which we must work hard and diligently. If we sit quietly, and wait passively for the time to come, without striving, we shall never witness it, even if we wait a hundred years. If this be true how can we accomplish the end desired? The only answer is:—"By the establishment of a National Assembly." Public opinion has now arrived at the conclusion that a National Assembly will enable us to promote and confirm our legitimate rights and influence. Any further explanation on this point would be useless and of no avail to improve our knowledge of the subject. Astute and well-educated men all say that, if we wish to revise the existing treaties, we must first have a National Assembly, but, wishing to make this more clear, we say:—"The revision of the treaties will follow the establishment of a National Assembly."

Yes! The reason why we wish for a National Assembly, is not because we are oppressed by the Government, nor because we are exposed to arbitrary conduct on the part of the officials, but simply because we are thrown into our present sad and unhappy position—the oppressed and despised of stronger and wealthier powers, and we wish to recover for Japan the privileges inherent to every nation, to promote the sovereign rights of our country in the future, so as to place the Imperial House in everlasting peace, save the Government from the envy and criticism of faction, and promote the welfare and influence of this Empire in the Far East. Notwithstanding such are the just and righteous reasons why the people of Japan desire a National Assembly, who do we find objecting to its establishment?

#### LAW REPORTS.

##### IN H. B. M.'s COURT FOR JAPAN.

Before MARTIN DOHLEN, Esq., Acting Assistant Judge.

Friday, the 11th day of June, 1880.

J. R. Bainbridge, boy on board the British barque *Pym*, was charged with desertion and larceny. The latter consisted of stealing \$1.20 from James Howgate, A.B., and 50 cents from Charles Smith, cook and steward of the *Pym*, before the prisoner left the ship.

Prisoner pleaded guilty.

L. J. H. Stapleton, master of the *Pym*, sworn said:—"It was reported to me, on the morning of June the 5th, that the boy had deserted during the previous night, taking with him all his effects, and that he had committed the two robberies mentioned.

Prisoner said he had not robbed the two men. He had robbed the master previously, and it was to that he had pleaded guilty.

James Howgate, A.B., sworn, said:—"The Prisoner robbed me. I went into the fore-castle on Friday afternoon last, and heard the chest I keep my cloths in shut. There had been \$3.20 in one of the pockets of a pair of pants, and

when I looked for it on Saturday, it was gone. I did not see prisoner take it, but am sure he did so.

Charles Smith, cook and steward, sworn, said:—"I was robbed by the prisoner of fifty cents. I did not see him commit the robbery. I had the money in the pocket of my pants, which were hanging in the galley, and, when I heard the other man had been robbed, I went to see and found my fifty cents were also missing. The prisoner was the only one who went into the galley, besides myself. He was constantly in and out of it.

L. J. H. Stapleton, recalled:—"I lost a sovereign early in the voyage, and the boy denied stealing it at first, but afterwards confessed to the theft. I do not wish to press that charge. The charge of larceny he is now charged with is on account of his stealing from the two men. I intend to clear the ship to-morrow, if possible. The prisoner may have from twenty to thirty shillings due him from the ship.

His Honour addressing the prisoner, said he stood charged with a very serious offence. There was a moral certainty that he had robbed his shipmates, but there was no legal proof of the fact. He would inflict the heaviest penalty in his power for desertion—ten weeks' imprisonment with hard labour.

#### IN THE UNITED STATES CONSULAR COURT.

Before General THOS. B. VAN BUREN, Consul-General.

Thursday, the 10th day of June, 1880.

John Noonan, formerly second mate of the American ship *Leonora*, was charged with being drunk on the race course on Wednesday, and obstructing the police in the execution of their duty.

Police Constable Schultze deposed to the facts, and the accused in reply to the Court said he had been drinking saké, and did not recollect what had taken place.

It being his first offence, and occurring at the races, the Court discharged the accused with a warning not to appear there again.

#### DOUBLE ACROSTIC.

SOLUTION OF DOUBLE ACROSTIC, OF JUNE 5TH, BY "BATONARA."

## TELEGRAPH REPORT.

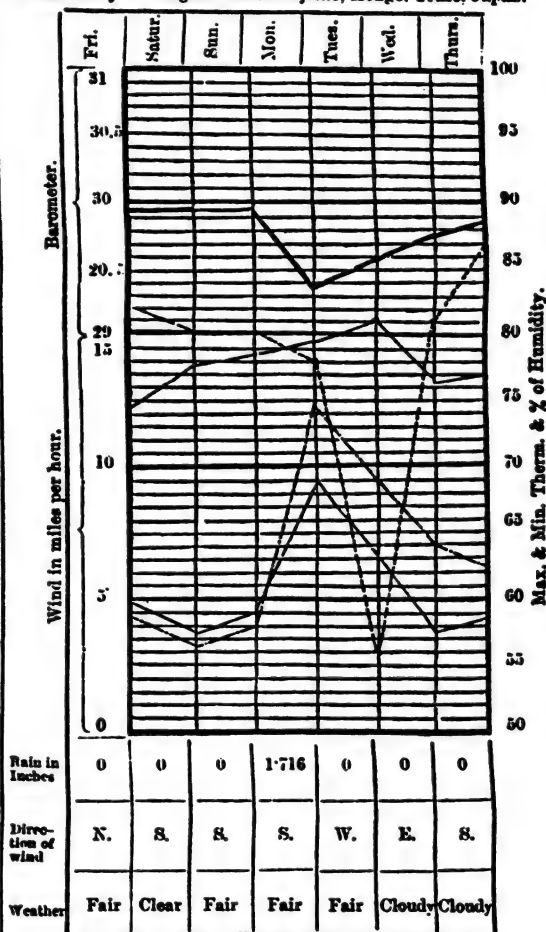

(Corrected to 9.30 a.m.)

All lines in working order.

## METEOROLOGICAL REPORT

FOR WEEK BEGINNING FRIDAY, JUNE 4TH, 1880.

Observatory of Daigaku, Moto-Fujicho, Hongu, Tokio, Japan.

## REMARKS.

Heavy line represents barometer.

Light continuous line—max. &amp; min. thermometers.

Dotted line—represents velocity of wind

.....percentage of humidity

Max. velocity of wind 23.5 miles per hour on Monday, at 7 a.m.

The barometer is reduced to the freezing point and to the level of the sea.

The highest reading of the barometer for the week was 30.009 inches on Sunday, at 7 a.m., and the lowest was 29.291 inches on Monday, at 2 p.m. The mean daily height of the barometer has been less than 30 inches during the entire week, and the lowest point reached was touched only twice during 1879. The total rain for the week was 1.716 inches, the amount of the corresponding week of last year being 5.203 inches; this includes, however, the maximums of rainfall for one day during the year 1879—being 5.960 inches on June 4th.

## YOKOSUKA STEAMERS TIME TABLE.

## MISCELLANEOUS.

## THE GREATEST

WONDER OF MODERN TIMES  
HOLLOWAY'S PILLS.

Persons suffering from weak or debilitated constitutions will discover that by the use of this wonderful medicine there is "Health for all." The blood is the fountain of life, and its purity can be maintained by the use of these Pills.

Sir SAMUEL BAKER, in his work entitled "The Nile Tributaries in Abyssinia," says, "I ordered the dragoman Mahomet to inform the Fakry that I was a Doctor, and that I had the best medicines at the service of the sick, with advice gratis. In a short time I had many applicants, to whom I served out a quantity of Holloway's Pills. These are most useful to an explorer, as possessing unmistakable purgative properties they create an undeniable effect upon the patient, which satisfies him of their value."

SIMPLE, SAFE AND CERTAIN!  
HOLLOWAY'S OINTMENT.

Is a certain remedy for bad legs, bad breasts, and ulcerations of all kinds. It acts miraculously in healing ulcerations, curing skin diseases, and in arresting and subduing all inflammations.

Mr. J. T. COOPER,

in his account of his extraordinary travels in China, published in 1871, says—"I had with me a quantity of Holloway's Ointment. I gave some to the people, and nothing could exceed their gratitude; and, in consequence, milk, fowls, butter, and horse-feed poured in upon us, until at last a tea-spoonful of Ointment was worth a fowl and any quantity of pear, and the demand became so great that I was obliged to lock up the small remaining stock."

Sold by all Chemists and Medicine Vendors throughout the World May 17th, 1878.

"HIGHEST AWARD & PRIZE MEDAL PHILADELPHIA EXHIBITION, 1876."

MATSUZAKA HOTEL,  
KIGA,  
(Hakone Hot Springs.)

Yokohama, July 19, 1879.

W. & A. GILBEY'S  
WINES AND SPIRITS.

W. & A. GILBEY have special facilities for carrying on an extensive Foreign Trade, having held for many years in their Excise Bonded Stores, for the purpose of their Home Trade, a stock of not less than 12,000 Casks of Wines and Spirits, which are equally available for Export. These stores are by far the largest private Duty Free Warehouses in the World, and are under the supervision of a staff of Excise Officers specially attached to these Warehouses.

THE EXTENT of W. & A. Gilbey's purchases enables them to give the best VALUE to the public, as a twentieth part of the Foreign Wines consumed in the United Kingdom is supplied from their stock. In the year 1876 W. & A. Gilbey paid duty on 1,881,049 gallons of Wines and Spirits, and the average quantity bottled and sent out by them daily was 3,050 dozens or 36,600 bottles.

QUALITY is guaranteed by W. & A. Gilbey, and is the same whether the Wines or Spirits are obtained direct from their Head Establishments or from any of their Agents. The purity and genuineness of every article in this list are guaranteed in accordance with Act of Parliament, 38 and 39 Vict., Cap. 63.

W. & A. Gilbey have always adhered to the standard of Bottle Measure recently recognised by the Government, namely—

6 bottles contain one gallon; 12 half-bottles contain one gallon.

SECURITY is ensured to the purchaser, each bottle bearing W. & A. Gilbey's seal and label guaranteeing quality and measure, and the strength also in the case of Spirits.

EDWARD FISCHER & Co.,  
Agents for Japan.

**KEATING'S INSECT POWDER,**

which is quite harmless to Domestic Animals.

In exterminating Beetles the success of this Powder is extraordinary, and no one need be troubled by those pests. It is perfectly clean in application.

Ask for and be sure to obtain "KEATING'S POWDER," as Imitations are Noxious, and fail in giving satisfaction.

SOLD BY ALL CHEMISTS IN BOTTLES, 1/- & 2/6 each.

**KEATING'S WORM TABLETS,**

A PURELY VEGETABLE SWEETMEAT, both in appearance and taste, furnishing a most agreeable method of administering the only certain remedy for **INTESTINAL** or **THREAD WORMS**. It is a perfectly safe and mild preparation, and is especially adapted for Children.

## TESTIMONIAL.

Medical Hall, Guildersome, Nov. 28th, 1876.

MR. KEATING,

Dear Sir,—I think it nothing but my duty to inform you of the immense sale I have for your Worm Tablets, which I may justly say is enormous, and in every case gives the greatest satisfaction. I have now in stock two bottles containing the Round Worms brought me during the last few days by customers, one Worm 40 yards long. I dare not be without the remedy.—Yours respectfully,

M. A. WALKER.

SOLD IN BOTTLES, BY ALL CHEMISTS AND DRUGGISTS.

**Proprietor—THOMAS KEATING, London.**

**REWARD AND CAUTION.**—Whereas fraudulent imitations of this unsurpassed remedy have been sold, I hereby request anyone knowing of the vendor of the same to communicate with me, on conviction of the offender a liberal reward will be paid.

## The "Japan Mail,"

A Daily, Weekly, and Fortnightly Journal,  
 ESTABLISHED, 1863.

## TERMS OF SUBSCRIPTION.

WEEKLY EDITION. The "Japan Weekly Mail," a Weekly Review of Japanese Commerce, Politics, Literature and Art:—Per annum, \$24: Six months, \$13: Three months, \$7.

FORTNIGHTLY Edition, being a Summary of the foregoing, is published for transmission by the American Mail Steamers via San Francisco. Per annum, \$12; Six month, \$7; Three months, \$4.

THE JAPAN DAILY MAIL is published every morning (Sundays excepted) and contains the Arrivals and Departures of all Shipping, Passenger Lists, Cargoes, Vessels on the Berth and in Harbour &c. &c. Also the latest Telegrams, Japanese news, Reports of Trials in the Courts of Law, Meetings of public bodies, and all matters of interest to the Community. Special attention is called to this Journal as a medium for circulating local advertisements. It has a large and constantly increasing circulation, its low price bringing it within the means of all classes of the community. It therefore affords exceptional advertising advantages, and secures to all announcements the utmost publicity, the object aimed at by advertisers.

SUBSCRIPTION PER MONTH—ONE DOLLAR.

## THE TRADE OF THIS PORT.

THE British Consular trade report for Yokohama, or, as English officials still persist in erroneously calling it, Kanagawa, for 1879, has been published, and is of the usual statistical and general value. It includes returns of the import and export trade, shipping, treasure received and forwarded, and British and foreign residents in the port.

The total value of the export and import trade was the same as in 1878, or about forty-two million dollars, with the notable difference, however, that the balance of trade for the last twelve months was in favour of exports to the extent of three million yen, whereas in the preceding period the imports exceeded the exports by ten million yen. As it is, returns for the whole of Japan show that the nation imported, in 1879, five million worth more merchandize than it sent away. The local commerce for the term under consideration is described as fairly remunerative to foreign and native dealers. Great Britain and her possessions stand at the head of the import list. The proportion is 57 per cent of the whole. China, including Hongkong, contributes 17½; France, 10½; United States, 10; Germany, 8½; and other countries, 1½. The United States take the lead in the export business, their share being 39½ per cent. France takes 21; China, with Hongkong, 19½; Britain and dependencies, 15½; Italy, 2; other countries, 2½.

Business appears to have commenced, in the month of March, to recover from its depression, yarns being the first staple that was beneficially affected, prices rising and large quantities being sold. The deliveries for the year were larger than even in 1878, when, although there was little profit, transactions were extensive. The increase was principally in Bombay manufactures, the consumption of

these goods being nearly doubled. A large part of the sales was made for long arrival. This practice appears to be indispensable in the present condition of trade in Japan, a fact which, we think, is to be lamented. It throws an unfair share of risk upon the importer, as has repeatedly been proved. Japanese traders have seldom much scruple in repudiating a contract which does not suit them, and recovery in the courts of law is tedious and difficult. Fortunately, in the past year, "a large part of the sales was made for more or less long arrival, and native buyers have had good reason for being satisfied with the result of their contracts, as they not only often had the benefit of a considerable reduction on the strength of the long arrival, but also largely profited by the advancing character of prices." This accounts for the welcome fact that in the period in question there were no complaints of bargains being broken off by the buyers. It also shows that the revival of trade which has been so gladly hailed in the west has extended to this region. The total quantity of yarns imported amounted to 229,638 piculs, valued at \$6,023,478, being a decrease, both in quantity and in value, as compared with the importations in 1878; but the actual sales were, as before stated, larger in 1879 than in the previous year.

In shirtings a large business has been done, but the market was by no means active. Prices were low and transactions very quietly conducted. A circumstance noticed in a previous report is again alluded to, namely that the better qualities often obtained worse prices in proportion to common ones, which is held to have induced merchants to introduce the latter in excessive quantities, with the result referred to. Of other fabrics blankets and cloth have diminished in value and amount; and, indeed, the acting Consul predicts that woollen cloth will doubtless soon cease to be an article of importation, the Japanese Government having, since October last, opened a cloth factory at Senji, one of the suburbs of Tokio, where, it is said, they can turn out cloth at least equal in quality to the foreign cloth hitherto imported, and at a cheaper price, although they have to rely on Australia for the supply of the wool, which costs them from 1s. to 1s. 10d. per pound laid down here. Expression is given to an opinion which we believe there is hardly ground to justify. Although Japan, at present, "produces no wool worth speaking of," the experiments already tried in the introduction and acclimatization of sheep have not been of long enough duration or sufficient extent to warrant the conclusion that sheep-farming may not eventually be as successful an enterprise as it is in Scotland or Hungary. Mousselines-de-laine keep the lead among the woollen manufactures imported, but prices have been low and sales unsatisfactory to the importer. Indeed the same may be said of the lighter woollen and mixed wool and cotton fabrics generally.

The report contains some interesting information about arms and ammunition, the importation of which is rapidly

falling off, the imports for last year being barely sixteen per cent of those of 1878. "With the exception of field artillery, of which Krupp has the monopoly, and, perhaps, occasionally some gunpowder from Belgium, the trade in arms and ammunition has come to an end. The Japanese now possess sufficient machinery and skill to manufacture their own arms." The author, on the occasion of a recent visit to the Tokio arsenal, saw a large number of Enfield rifles being converted into Sniders, which, he was told, were intended for the armament of the national guard, while the regular army is to be provided with the Murata gun (a modified Chassepot, the invention of Major Murata), for the manufacture of which a splendid new building was nearly completed. The same establishment can turn out daily two hundred thousand cartridges. It contains some fine specimens of bronze mountain guns made in the Government cannon foundry at Osaka.

There is not much to comment upon in that part of the report which treats of metals. In some respects the trade has diminished, a fact which is in part ascribable to the higher rates of freight obtaining than were current at an earlier date. Pig lead has fallen off by about seventy per cent. This metal is chiefly used by the War Department, and the demands have been for small quantities only. The request for tin-plates has augmented; but the figures quoted, when comparison is made between the amount of import and the prices realized, do not seem to be reliable. The incidental interference of the kerosene oil trade with that in tin is also mentioned, as the empty tin oil cases are sold very cheaply, and used for the manufacture of tin ware. Of kerosene it is said that it was imported from America on a larger scale even than in 1878. "This trade has, however, been greatly overdone, and, as the natural consequence, it has been attended with ruinous results. The year closed with a stock estimated at 281,000 cases, and with quotations at \$1.80 to \$1.82 per case of 10 gallons, or 65 lbs. weight. In spite, however, of losing prices and utter stagnation, the arrivals of kerosene have steadily continued, and the stock at this moment (May, 1880) is estimated at no less than 750,000 cases, while the price has fallen as low as \$1.55 to \$1.60. It must be presumed that large orders for kerosene have been given in view of the revision of the import tariff, which, if adopted, will impose a considerably increased duty on this article." Sugar was nearly eighty per cent of miscellaneous local imports, and was, as usual, principally conducted by Chinese.

In the *Japan Weekly Mail* of the 17th of January and 14th of February last, we so thoroughly reviewed the silk trade of the previous year that extended reference to Mr. Dohmen's remarks would be superfluous. Of tea we read that the exports amounted to 165,189 piculs, valued at \$4,562,998, being an increase in quantity of 52,447 piculs, and in value of \$1,967,351. Of the whole, with the exception of a million pounds to Canada, and half a million pounds to England, all the tea was again sent to the United States. The average of the year's business was satisfactory to all concerned, for, although the losses on late shipments were heavy, the profits on the purchases in June, July, and August more than counterbalanced them. The quality of the leaf, however, hardly came up to the average of previous seasons, and much of the tea, received during October and November was very carelessly prepared. The making of black teas for the English market again decreased, owing to the poor results of the same to the producers as compared with those prepared for the American market. The settlements of this class were 3,705 piculs, and belonged chiefly to the crop of 1878.

The total export for the year was lbs. 21,896,880, of which quantity more than thirteen and a half million were carried in English bottoms, nearly nine million passing through the Suez Canal. An increase of lbs. 600,000 in the export to Canada is ascribed to the differential duty which has been imposed by the Dominion Government upon tea arriving via the United States,—a duty which has brought the agents of a local firm here into trouble to the extent of \$90,000. Half of the tea business of the port continues to be in English hands.

The export of rice has not realized the promise of the previous year, when, having attained a total value of one million dollars, it was regarded as a future certain source of profit to the country. The acting Consul explains this in an intelligible manner. Japan, last year, had an abundant harvest, it is true; but prices are abnormally and irrationally high, owing, no doubt, "to the enormous depreciation of the paper currency," which precludes the possibility of transferring it to foreign marts with any chance of profit. Exports for 1879 from Yokohama were confined to 42,000 piculs, against 400,000 in 1878; and the total shipments from Japan last year are only estimated at 186,000 piculs. Yet the "surplus over the full average crop is estimated at about eighteen million piculs, twelve million piculs of which are supposed to be available for export.\* If, therefore, Japan were willing, and able to dispose of this available surplus, say at a minimum price of \$2 per picul, she might this year almost double the value of her exports, and at the same time provide good employment for her rising mercantile marine. It should, however, be borne in mind that rice in large quantities can only be disposed of in eastern countries; and unless, therefore, there be a great demand from Asiatic markets, it will not be an easy matter to turn so large a surplus into money."

On the other hand, it must be remembered "that rice can be imported to Japan from Saigon at \$2.25 per picul, freight and all charges included, while Japanese rice of average quality cannot, even at the present premium of silver versus paper money, be bought for less than \$2.80 to \$3 per picul. The Japanese, however, consider the Saigon rice much inferior in quality to their own."

Wheat, which has only a limited cultivation as yet, was exported in much less quantity during last year than in the corresponding previous period, the harvest having been very bad. The 'fashion' for Japanese ornaments has caused a large augmentation in the export of curios; and the match-manufacturers have not only succeeded in rendering the import of matches from Europe useless and unprofitable, but have found markets in neighbouring countries for the surplus production of their wares.

As our readers are sufficiently familiar with the question of the paper currency of the empire we will not draw upon the acting Consul's report for information in this respect;

\* In a postscript to his report the acting Consul admits that he has been informed that the estimate of the surplus of last year's crop has been greatly exaggerated.—He adds "I have no means of verifying whether there is, or not, rice in large quantities for sale in the interior, but even if my informant should be right on this point, this would not necessarily prove that the harvest has been less abundant than it has been reported to be. Might not, for instance, the true reason for the absence of large stocks on the rice markets be that the farmers are unwilling to part with their grain for paper money which no longer gives them any clear idea as to what it really represents in coin! I am fully aware of the great difficulty that exists in obtaining reliable statistics about the annual produce of rice in Japan; and it is, of course, quite possible that the estimate which I have given, may turn out to be wrong; but, in the absence of any better information on the subject, I must allow the figures to stand as they are. These figures are the result of careful calculations made by competent persons, and based on the estimates of the crop of the 71 rice-growing provinces, and published under the authority of the Tokio Chamber of Commerce, which institution is composed exclusively of leading Japanese merchants and bankers."

but will bring this notice to a close with the quotation of the following tables of imports, exports, shipping and nationality.

### THE IMPERIAL PROGRESS.

IN another column of our issue to-day will be found an account of the departure of the Mikado and his suite on a tour through some of the central and southern provinces of the main island. This is now the third prolonged journey which His Majesty has made through his empire within the last four years. The first, undertaken in the autumn of 1876, led through most of the northern provinces and towns, and terminated at Hakodate. In the second, which lasted about three months, the great central provinces, as well as many on the west coast and the neighbourhood of Kioto, were visited. The present one will also terminate at Kioto, it being the intention, it is stated, of the Emperor to worship at the tombs of his ancestors. A visit may also be paid to the celebrated Shinto shrines at Ise, the earliest depository of all that is most sacred and ancient among the treasures of this early religion. The

sternest simplicity seems to govern every outward form and expression of this Imperial faith, contrasting strikingly with the pompous and grotesque display evinced in the temples and monuments of the religion of Buddha patronised by the people. The tombs of His Majesty's ancestors, situated on the verdure-clad slopes of the hills behind the temple of Senjuin at Kioto, exhibit a rugged simplicity and absence of anything like form or comeliness, which would surprise any one who, familiar with the gorgeous shrines of the Shoguns, expected equal or greater grandeur in the cemeteries of the Imperial dead. High above the toiling crowd of common men, and hidden strictly from their vulgar gaze, stand these antique, roughly-hewn hard stones, marking the burial places of the deified rulers of Japan. To others was left to dazzle the people by luxurious monuments.

It will thus be seen that, at the termination of the present tour, His Majesty will have seen more of his country than the great majority of his subjects. Schools, industrial establishments, objects of antiquarian or historical interest, will all receive attentive examination. The object of such progresses as this is not mere pleasure-seeking. Indeed, in many cases, a journey into the interior, even with all the luxuries of Majesty, must be quite the reverse of a pleasure. It is doubtless the desire of His Majesty and of his Ministers that he should be acquainted, by personal observation, with the condition of the country over which he rules, and thereby fit himself more and more for the duties of the august station which he occupies. In former times it was common in Japan, as well as in other countries, to confine the monarch to his palace, where he passed away his time in enervating luxury, while the real power was wielded by some ambitious *maire de palais*. This was virtually the case in Japan for many centuries back. The Mikados lived in a state of seclusion in Kioto, were permitted to take no part in matters of state, and were regarded by their subjects as semi-divinities, something like the Great Thibetan Dalai Lama,—except that this latter personage exhibits himself to all his adorers,—while even the highest officials of the Japanese empire were not permitted to gaze on the face of their sovereign. Meantime the country was actually governed by the Shoguns, residing three hundred miles off at Yedo. With such a state of things as this, there is no cause for wonder that strangers coming to the country should have believed in the existence of two sovereigns, one temporal, the other spiritual, or that the error should be widely disseminated in Europe, even at the present day. The Restoration put an end to such an abnormal condition of things, and now "the king has his own again."

It is impossible to travel anywhere in Japan without noting the wide gulf which separates the country of to-day from feudal Japan. But the absence of *samurai* and swords, or the presence of railways, telegraphs and steamships, is hardly so indicative of this difference, as is a progress of the Mikado among his people. All other dynasties of the world are but of yesterday compared with that of the Emperors of Japan. In speaking on this subject, one refers instinctively to Macaulay's celebrated passage on the Roman Church, and much of what he says is applicable to the Mikadoate. The line can be traced back in an unbroken series from the present occupant of the throne to its occupant in the eighth century; and far beyond that it extends until it is lost in the twilight of fable. It may well be said that dynasty after dynasty "has wended its way slowly on into eternity," but the Imperial dynasty of Japan still remains, "not in decay, not a mere antique, but full of life and youthful

vigour." Like the Roman Church, "it was great and respected before the Saxon had set foot in Britain, before the Frank had passed the Rhine, when Grecian eloquence still flourished at Antioch, when idols were still worshipped in the temple of Mecca;" and, if we accept the ordinary chronology, the Roman Church itself is modern compared with the Imperial house of Japan. The spectacle of a descendant of this august line, suddenly stepping down from his position as a demigod, and mingling with his subjects in the manner of European sovereigns, is surely one of the most remarkable signs of the times. European peoples have long been accustomed to regard their monarchs as mere human beings of noble blood and more time-honoured descent than their subjects, and, on account of their high and difficult position, deserving of all reverence and loyalty, so long as they aim only at exercising their lawful power for the rule and welfare of their people. To the Japanese at large, on the other hand, their Emperor is a deity of more than temporal superiority over the best of men. To them these public progresses and Imperial appearances before the public gaze, are an evidence of more condescending, or perhaps even humiliating, graciousness than more practical nations could well imagine. It is a curious fact that the whole history of the country reveals no instance of the most rebellious disturber disputing the justice of, or hesitating to comply with, the Imperial command. Often has the edict of a puppet Emperor been used as a tool by his ambitious viceroys for obtaining selfish and unjust ends, men fearless of death or torture bowing in all cases without resistance to the supposed Imperial will. As an instance of the reverence accorded to the Mikado, it is recorded that, during his tour in the north in 1876, in many places holes were literally dug in the ground over which he sat by people eager to obtain even a handful of earth considered sacred by contact, however remote, with the Imperial person.

Called on to meet with changed circumstances and a changed world around him, the present Emperor has manfully accepted the position, and with the aid of tried and able advisers, seeks to render himself worthy of his throne. The efforts of this people, their leaders, and their youthful sovereign, to regenerate their country, and secure its independence and equality among the nations of the earth is worthy of the warmest sympathy; and it should be some encouragement to them to persevere when they find that these efforts have the sympathy of disinterested and experienced spectators.

Much is now being said and written about the growth of republican sentiment throughout the world, and the future destruction of all monarchy is confidently prophesied by ardent politicians. If these speculations should ever be realized, and throne after throne should fall before a wave of democratic feeling, we venture to think, from the past history and present impressions of the people of this country, that the Imperial line of Japan will be among the last to succumb. To recur to the writer previously quoted:—"It saw the commencement of all the governments and of all the ecclesiastical establishments that now exist in the world; and we feel no assurance that it not destined to see the end of them all."

**T**HE *Mainichi Shimbun* is not remarkable for the general accuracy of the intelligence which it communicates to its readers. As a rule, Japanese newspapers are somewhat sensational; but of those known to foreign readers, our Tokio-Yokohama contemporary is certainly *facile princeps* in this respect. One is almost led to the conclusion that it publishes incorrect news one morning, that it may have the satis-

faction of contradicting it the next. Its state is one of chronic denial of its information. We are not disposed, therefore, to attach too much credit to its account of difficulties between the Japanese settlers at Fusan and the authorities of the neighbouring Korean city, Torai Fu. According to this statement the export of rice was forbidden by the Korean authorities, considerable loss being thereby occasioned to the Japanese merchants, in what manner is not explained. Indeed it is added that some of the residents were bordering on starvation. The account goes on to say that one of the officials of the Consulate, not being able to obtain any satisfactory explanation of this state of affairs from the authorities, the members of the Japanese Chamber of Commerce determined to attack the large walled city of Torai Fu, and make forcible purchases of rice. To accomplish this warlike purpose, an advance army of twenty started on the morning of the 30th May, the main body, consisting of fifty of these bellicose traders, following soon afterwards. The veracious chronicler of this attempted siege has satisfied himself that there were not more than eighty warriors outside at any time. Having arrived at the walls, they found the gates shut and guarded by a large number of soldiers, whereupon they incontinently challenged the officials to fight. A consular interpreter, however, succeeded in getting them home, nothing the worse for their journey. The question was peaceably settled the following day by the Consul, who obtained the removal of the prohibition to export rice, and, also, permission for the Japanese officers to arrest any Korean officials (*sic*) who should obstruct the export of cereals. It is impossible to place much confidence in this narrative. It is quite possible that some difficulty between the officials of the two countries may have caused excitement among the settlers; but it is evident that, with the large force of police at his disposal, Mr. Kondo would not have permitted such a breach of the peace as that contemplated by the merchants. The Japanese Government has frequently exercised its right of prohibiting the export of rice, and it would hardly permit its own subjects to endeavour to prevent the exercise of that right by the Korean authorities. The considerate, and we may even say lenient, treatment which Korea has received at the hands of Japan, lead us to believe that *émeutes* by Japanese subjects, of the kind mentioned here, will be sternly dealt with. At least for her own credit it is to be hoped that Japan will repress, in her own subjects, similar arrogance and violence to that from which she herself suffered in the early days of her foreign intercourse. Her brief period of modern relations with Korea reflects the highest credit on her. There has been no bloodshed, nor, as far as we can see, wrong-doing or oppression; and it is the duty of the Government to see that its own humane policy is not nullified by the hasty acts or violence of its subjects.

**W**E have received from the pupils of the late Mr. Yoshidatsu Enouye, LL.B., formerly Professor of Law in the University of Tokio, a little work compiled by them, and containing the miscellaneous essays of their instructor, together with a short sketch of his life. This memorial is published by the students, "not so much for the intrinsic merit of Enouye's essays, but rather as a tribute to the memory of him, whose friendship they most highly valued, and whose untimely death they deeply mourn." Born in 1852, the subject of the sketch was one of the youths sent by Mr. Kuroda, at his own expense, to study in America. In the early part of 1868 the party embarked for America "clad in so-called European costumes, which, . . . consisted of a long mantle and short trousers, together with a red flannel shirt and a narrow paper collar. The advent of these peculiar personages in San Francisco in semi-American

costume, attracted the common people, who flocked around them, staring and examining them from head to foot. From San Francisco they proceeded to Panama by steamer, and thence to Boston, where they arrived in the latter part of October, 1868. Here, as strangers in a strange city, and at first with no other friends than their countrymen, they were soon welcomed by Mr. Gilbert Attwood, whose interest in Japan made him at once their good and true friend. At his congenial home in Jamaica Plain they passed many pleasant evenings, where they quite forgot the care and anxiety of foreign life. Enouye, for by this name alone he was known in America, took up his residence at Boston Highlands in Massachusetts, and became a student with Mr. Delaway, through whose assistance, together with that of his neighbors, Mr. Weston and Miss Reed, he was enabled to perfect his knowledge of English." In the autumn of 1869 he entered the military academy at Worcester, Massachusetts, but soon relinquished the study of arms for that of law. In 1874 he received the degree of LL.B. from Harvard University, which then for the first time conferred that academic distinction upon an Oriental scholar. He shortly afterwards left America, quitting for the last time a large circle of friends, whom his amability and talent had attracted to him from among his own countrymen and Americans of intelligence and social standing. On his return to Japan he was first employed in the Naval Department, where he was out of place, as during his long residence abroad he had almost entirely forgotten his own language, and could neither display his acquired knowledge of varied subjects, nor make his influence felt. In April, 1875, he was appointed to a more congenial sphere, being inducted into the chair of law in the metropolitan university. This post he held with credit until the day of his death which occurred in January, 1879, at the early age of twenty-six. An obituary notice which appeared in a Boston journal said of the deceased that:—

By his American friends he was greatly beloved, adding to natural grace a delicacy of sentiment that was very attractive. Full of zeal for knowledge, his mind was on the alert to grasp the opportunities that were spread before him, in a country which was completely foreign to his early surroundings. The sad news of his death brings vividly to the mind of the writer many and many long discussions over the future of his own country—his hopes and his fears for Japan.

These fireside talks often took a wide range, and broke out into little narratives of his far-away land—travels, anecdotes of household events, odd peculiarities of odd Japanese, and a thousand details of such things as had impressed his mind in early life—all told with a graphic energy and sense of humor most charming to his auditors. One could not but realize that political forethought, home affections and sympathies, and wit and humor, and crabbled oddities, were as truly Japanese as American; that we were all of one great brotherhood; that the accident of having been born half a world apart had made no difference in our fraternity.

The essays contained in the brochure before us display considerable talent of observation and perception, and are written in idiomatic English, and brightened with much dry humour. It is probable that, as has been the case with others of his compatriots, Mr. Enouye's zeal for knowledge, and overwrought application in its pursuit, hastened the fate which cut the thread of his bright young life in the very morning of its promise and commencement of usefulness.

THE *Mainichi Shimbun* in an article, a translation of which we publish in another portion of our present issue, appears to attach more importance to the trade between Japan and Corea than the circumstances really warrant. If the *Mainichi* is a faithful reflex of the feelings of the Japanese Government and people, which we doubt very much, it is evident that every endeavour will be made to frustrate the

peaceful efforts of western nations to enter into commercial relations with Corea. As the writer pointedly remarks, two-thirds of the goods exported from Japan to Corea consist of the products of foreign nations, and have been previously imported to Japan, and, we may add, duty has there been paid upon them. The opening of ports in Corea to the commerce of the world would naturally have the immediate effect of throwing all this trade into the hands of foreigners, create a greater demand for Corean produce, and probably, in course of time, supplant the Japanese commerce altogether. The *Mainichi* is apprehensive that, if hostilities occur, the growing trade will be annihilated at once, and much suffering inflicted upon the Japanese residents as well as upon the Coreans themselves. It cannot be questioned that a crisis is impending in the affairs of Corea. Whether the result will justify the trouble taken remains to be seen, but America and Russia are evidently desirous that Corea shall no longer remain to them "the forbidden land."

ALTHOUGH the *Hongkong Daily Press* is mistaken in its alleged belief that a deep-rooted desire exists in the minds of the people of Japan for a representative government, there is, in spite of other errors of perception or appreciation, much sound counsel in a recent article which has appeared in that journal. "It is rather doubtful whether the Japanese are sufficiently advanced to be entrusted with the functions of self-government. It must be remembered that for ages they have submitted to a paternal rule, under which, if not rich they were content, and that they require the education of experience to teach them how to wield the franchise. The existing administration have laboured hard and, we believe, both consistently and conscientiously, for the welfare of the nation, but they have—and not unnaturally—been led into the commission of some unfortunate mistakes, and have now and then dealt harshly with the Press." Any foreigner who has not been a resident in Japan, nor witnessed the chaotic and licentious state into which the liberty at first accorded to the newspaper press of Japan was leading its conductors, cannot properly understand the difficulties which the Government had to confront in this quarter, and the necessity for a stringent control over the new institution. The writer very properly deprecates the expressions used by that speaker at the farewell banquet given to Mr. Yauagiwara, recommending the new envoy to Russia to investigate the system employed in that empire in dealing with its Nihilist subjects with a view to its adoption in this realm. The speech, if it were really an *oratio habita*, was after all but the obscure utterance of a postprandial declaimer, and had no political significance. However the commentator succeeded in pointing a moral which is worth citing:—

Our Japanese friends should, therefore, look elsewhere for an example to guide them in the work of ruling the disaffected portion of the people. Instead of turning to Russia; whose case is really not parallel, let them hark back to the great civil war in America, when the South was arrayed against the North. What followed the victories of Ulysses Grant and the restoration of the Union? Did the Federal Government take vengeance on the Confederates, and execute, banish, and imprison the leaders of secession? No; there was no revenge taken: no harsh measures were adopted to perpetuate the feud and keep up the bitterness of the quarrel. A policy of conciliation and generosity was adopted, to the lasting honour of American statesmen, and the credit of the whole nation. And what is the result? Simply this, that a revival of the struggle is a thing undreamed of and impossible. Let Japan apply this lesson to heart. Let her Government do what they can to alleviate the lot of those whose fortunes and careers have suffered by the introduction of a new system of administration; let them try what conciliation and

judicious and gradual concession can effect towards winning the loyalty of the whole people and healing all temporary grievances. The last thing they should do is to seek instruction in the art of governing from the Muscovite Empire. To do so would be socially and politically disastrous internally, while such a course could not fail to estrange the sympathies of the more enlightened and liberty-loving nations of the West.

THE *Nichi Nichi Shinbun* is responsible for the statement—absurd on the face of it—that Japanese envoys abroad are for the future to be selected from among the generals in the army and admirals in the navy. As a suitable pendant, it may possibly be next reported that for the future the admirals commanding the navy, and the generals commanding the garrisons are to be taken from the corps of Japanese diplomatists. In former times it was not uncommon to find men, like General Monk, who fought equally well by sea and land, and who were also skilled in diplomacy. But in modern days, what with hundred-ton guns, armour plates, steering by machinery, Winchester rifles, &c., such versatility rarely obtains a chance of developing itself. It is true that there are both military and naval officers in the diplomatic service of every Government, but these cases are the exception, and not the rule. The *Kinji Hiron*—that persistent grumbler—seems to think that the “young students,” as it is pleased to call them, who now hold the chief diplomatic posts abroad, are unfit for their duties, and that any change must be an improvement. Messrs. Mori, Sameshima, Yoshida, Yanagisawa, Wooyeno, are all “young students,” with no experience in their calling. If those gentlemen are unfit for their posts, the question arises, who is fit? The *Kinji Hiron* will perhaps be good enough to tell us, who should be appointed to Washington, Paris, London and St. Petersburg. Among the journals published in the capital, some of the very best and some of the very worst articles are to be found in the *Kinji Hiron* and its confrère the *Fuso Shinshi*; but, good, bad or indifferent, growling and petulant complaining cannot be avoided. We are reminded of Mr. Dick who could not keep King Charles's head out of his petition. Nothing is properly done in any department: the officials, one and all, are incapable: their measures are senseless: all is vanity and vexation of spirit. The Psalmist said in his haste, “all men are liars.” The two little radical Japanese journals would doubtless apply this sentiment to the rulers of their country, adding, “and fools too.” The editors of these papers alone have a monopoly of wisdom, discretion, experience, knowledge, loyalty, and patriotism. They are at liberty to believe this, if they wish, but we cannot see any proof of the harsh administration of the press laws in the fact that such journals are allowed to declaim at their own will without interference from the authorities.

## THE CASTLES OF JAPAN.

### II.

#### OSAKA CASTLE.

ON the banks of the Yodogawa, its high walls overlooking many miles of fertile country between Osaka and Kyoto, still are to be seen portions of the grand fortress first erected by Hideyoshi in the tenth year of Tensho (1583). The ground on which Osaka castle stands had originally belonged to the priests of Honwanji, being occupied by a large monastery well fortified and protected, from which, with the aid of the faithful who flocked in crowds to their cause, they had successfully repulsed the famous general, Oda Nobunaga. The ambitious Taiko Sama having set his covetous eyes upon the fine position which these conventual buildings occupied, determined upon obtaining it for a military stronghold. A message was accordingly despatched to the Emperor persuading him that the construction of such a citadel was indis-

pensable in order to protect the royal city and person; the result of which was that the Honwanji priests received an Imperial command to hand over the land to Hideyoshi and to retire to Saika in the province of Kishiu.

This was no sooner successfully accomplished than the military works were commenced, all loyal daimios, as was customary on such occasions, contributing their own portion of the work. A general plan being decided upon, each prince had his allotted part, for which he provided workmen and funds, and thus by combined energy the engineering works and principal buildings were all completed in less space than one year after commencement. The whole area occupied within the circuit of the outer walls was 120,000 tsubo, measuring 620 yards from east to west, and 780 yards from north to south. The inner enclosure, which went by the name of *Honmaru*, was 14,900 tsubo in area, having a width and breadth of 200 and 290 yards. This space contained many acres of land devoted to the buildings for the leaders and their retainers, a number of storehouses, and the large keep called *Tenshu*. There are said to have been originally twenty-nine storehouses for rice, twelve stores for fuel, one store for documents, one for medicines, and one for large cannon and implements, as well as others for smaller arms. All of these were constructed with clay and plaster to render them fire-proof. The large inner keep, more than one hundred feet square at the base, stood upon a battering stone basement forty-eight feet high, reached by stone steps and platforms placed at the side, and protected by walls and battlements. The stones used in the construction of this battering base, as well as in the basements of most of the gateways and turrets, are of enormous size. There are several blocks measuring in length and breadth more than fourteen feet upon the face, and one, twenty feet in length. These appear to have been transported from the neighbouring granite quarries on enormous rafts, and conveyed from the river by means of the canals and moats of the castle to their places of destination. Upon the stone platform of the keep was constructed a three-storied *donjon* some forty-five feet in height. As in the case of most Japanese military buildings the timbers used in the framework were of enormous thickness, hidden externally in all parts (including also the projecting rafters of the roof) by means of a thick coating of clay and plaster for protection from fire. In addition to the numerous wells within the grounds, a deep well was dug within the walls of the tower itself, in order to provide the besieged with water in their last extremities.

Osaka castle, when first built by Hideyoshi, had three surrounding moats and escarpments, the water ditch being filled up in later times by the Shogun Iyeyasu. There are now standing two circuits of moats, following, with the walls, an irregular outline with salient and re-entering angles, so as to command and give flank protection to every part of the line. The large spaces confined between the walls thus vary much in width. The principal salient angles are crowned with corner turrets called *Yagura*, low loop-holed curtain walls running between and forming the defences of the parapets. The steep imposing escarpments which present their broad slopes to the front have a corresponding inner slope of small depth, the parapet being reached from the inside by a *banquette* of stone steps. There are said to have been twenty separate rows of these curtain walls or palisades, the outermost having between them concealed trenches twelve feet wide and eighteen feet deep, carefully covered with bamboo branches and earth, so as to form a hidden trap for the enemy, to which was given the name of *Otoshi-ana*. It is said that in one of the battles in Taiko's time more than two thousand of the besiegers perished, entrapped in these hidden pits; workmen being employed in great numbers to restore the broken portions as soon as they had fallen in. The curtain walls were one foot and a half in thickness, being constructed of clay mixed with small stones and a quantity of salt. The salt is said to have had the property of assisting the hardening of the composition. The bottom of the moats were covered with sharp wooden stakes fixed in great numbers in the bed of the stream so as to impede the crossing of the enemy, by causing pain and damage to the feet of horses or men. The *revêtement* of the *escarpe* was constructed with large polygonal blocks of stone of a more or less pyramidal form, presenting an irregular rubble face, strengthened at the corners and angles by large *quoins* of properly squared ashlar work, laid without mortar, but bound together in many cases by large iron or copper cramps.

The moats, some hundred and fifty feet wide, are crossed opposite to the castle gates by bridges of wood lightly constructed, so as to be easily cut down or burnt when the castle is threatened by imminent danger from the besiegers. The bridge forming an approach to the principal gate went by the name of *Sarobin Bashi*, and was so constructed that the removal of one large wooden key would cause it to fall into pieces. The bridge could thus be allowed to remain to the last for the use of the besieged, and could be quickly destroyed even under the enemy's feet, who by its sudden collapse would be thrown into the stream below.

Each gate of the castle was protected by an inner court, having a second entrance at the side, and a surrounding parapet, so as to command it from all sides; in addition to which the gates were mostly protected by a neighbouring tower. The enemy having stormed the first gate would find a second or even third to be passed, each surrounded and defended by high walls and palisades. In the same way the *Honmaru*, or space within the inner moat, would be subdivided by entrenchments and fortifications so that the castle could be held and defended bit by bit to the last extremity. On one side the river Yodo gave an outer defence to the castle, and it was towards this side, more naturally defended than the others, that the keep and principal entrances were placed. The castle was indeed so strong that Iyeyasu, after successfully placing it under his own rule, thought it politic to considerably reduce its area and strength, probably on account of the distance from his capital, and the fear of possible treachery and rebellion.

Among the other means of defence may be mentioned a large moveable tower on wheels, which could be moved about to any portion of the castle for the purpose of defending the weakest points.

The nineteenth year of Keicho (1615) saw Iyeyasu engaged in the thick of the war against Hideyori, the son and would-be successor of Hideyoshi. Hideyori, with his mother Yodo and retainers to the number of 130,000 men, were besieged in the castle of Osaka and driven to great extremity, having burnt their bridges and almost exhausted their supplies. This siege was the severest to which this fine citadel has ever been subjected, and was attended with fierce and destructive fighting, the besieging troops of Iyeyasu numbering 340,000 men. Yodo, the mother of Hideyori, narrowly escaped death within the castle from the danger of the besiegers' fire, a large ball entering her private room and killing three of her attendants during the operations. One of Hideyori's retainers, by name *Nanjo*, was engaged in treacherous overtures and in conveying secret information to Iyeyasu. He was detected and beheaded: his head being flung to the enemy from one of the towers, with the derisive ejaculation that, since the victim's life had not been spared long enough to welcome their entrance in person, his head was at least sent to meet them. The irritation caused to this scornful derision is said to have been the occasion of the fiercest of the onsets which ensued. The moats were filled by the enemy, who, to the number of 13,000 men, led the attack with large grappling irons attached to ropes which were thrown on to the stone escarpments, to form means of scaling them. To meet the shower of bullets and arrows with which they were assailed from the battlements and towers, the attackers carried as shields large bundles of smooth bamboos bound together by cords, as well as large logs of wood which they held in front of them as they advanced. These seem to have been effectual in warding off the bullets as well as the arrows, especially the *faeces* of bamboo, which turned their course by causing them to glide off their tough smooth surfaces. At length large stone projectiles were tried, doing fearful havoc among the besiegers. In fine, a truce was obtained for the purpose of a parley, Iyeyasu sending to Hideyori a message with three conditions of surrender.

First; if Hideyori would give up the castle and retire to Koriyama, his life and that of his retainers would be spared. Secondly: instead of this to deliver up his mother Yodo as a hostage and a guarantee of good faith. Thirdly: in case he objected to both of the former propositions, that he should destroy the castle and fill up the moats. The last of these conditions shews how strong and dangerous was considered the position held by this large citadel, the first of the Tokugawa Shoguns being willing to leave some thousands of his enemies at large, in exchange for the destruction of so strong a fortress in the neighbourhood of his foes. These propositions being treated with scorn, the castle was eventually taken and burnt, and

Hideyori and thousands of his followers slain. After this victory the strength of the castle was much diminished by Iyeyasu, who filled up the outer moat at the time of restoring the wooden buildings.

Osaka castle has played an important part in the disturbances of later times. During the rebellion in 1868, the ex-Shogun in his last struggle against the Emperor, occupied this fortress just before his final defeat and surrender. Seeing little chance in further resistance, he deserted the castle and fled to Tenpozan with some of his retinue, and on the following day the military buildings were all burnt to the ground, many wounded men perishing in the flames. The huge old walls and moats of Taiko have always remained: the buildings have been frequently rebuilt, and since the rebellion have been only partly restored. For the most part, what remains may be looked upon as a noble ruin, and but a shadow of the mighty citadel which once stood there in the warlike feudal times.

### CORRESPONDENCE.

[Our readers must distinctly understand that we are in no sense responsible for the sentiments or opinions of our correspondents, for the accuracy of their assertions or for the deductions they may choose to draw therefrom.]

### PURE (?) JAPANESE—AND POOR ENGLISH.

#### TO THE EDITOR OF THE "JAPAN WEEKLY MAIL."

DEAR SIR.—In the last issue of the *Mail* appeared a review of the recently published volume of the Transactions of the Asiatic Society of Japan. In mentioning the paper entitled "Catalogue of the birds of Japan," your reviewer quite justly points out the absurdity of using the "new system" of transliteration in a treatise of this kind. He might have gone a step further and shown, that the very instances he quotes, carry with them condemnation of the system altogether, because they prove that its staunchest supporters, in spite of their most careful efforts, are themselves unable to write according to their beloved theory. It is gratifying to find that one of the instances afforded here is exactly the same as has on former occasions been adduced in the *Mail*, to show how impossible it is to carry the proposed system into practice. You have repeatedly demonstrated that such a syllable as *Kio* can be written in different ways in the Kana, thus—*Kigan*, *Kigon*, *Ken*, and *Kesu*, and that without a thorough knowledge of the Chinese characters and constant reference to a dictionary, nobody could attempt to decide which of the varied modes of spelling is to be used in any particular case; and now we find those who affect to use the system, write the first syllable of *Kiyu-iku Hakubutsu-Kwan* sometime *Ken* and again *Kigon*! The second instance quoted by your reviewer is equally to the point: what is six times written *Nitakuken* by Messrs. Blakiston and Pryer, is in as many other places spelt *Nitau-Kuan*. Perhaps it may interest your readers to know that both of those combinations stand for *Nikkū*. (Probably they may think that this beats the 13—15—14 puzzle, but I can assure them my solution is the correct one).

It might, perhaps, be thought that, if ever a phonetic system of transliteration had a claim to be used, it is where a writer desires to convey the sounds or cries emitted by animals. How absurd then does it appear, to find that the kingfisher is called *Kiyun-roru*, owing to "its mournful cry *Kiyun-roru*"; or that the cuckoo is called *Zhifu-ichi*, because "it repeats the word *zhifu-ichi*"—laughable, we might almost say, when we know that the birds referred to, and their cries, are *kio-roru* and *ja-ichi*. Shall we conclude that the kingfisher and the cuckoo spell according to Satow's system?

A most amusing instance of narrowness of mind appears on page 212. There is a Japanese bird called *Yotaka*. This bird was first classified by Temminck and Schlegel on the information supplied by Siebold, and its name was naturally spelt by them as it would be written in Dutch or German, and the bird was accordingly called *Caprimulgus yotaka*. With reference to this Messrs. Blakiston and Pryer say: "This distinct species was figured in the *Fauna Japonica*, where it received a wrong native name owing to the Dutch pronunciation of the letter 'j'." The Dutch may indeed consider themselves fortunate that their language escapes as it does; how truly English would it not have been to say owing to the *erroneous* Dutch pronunciation of the letter 'j'? After this, one is surprised to find, on p. 232, that where the two Zoologists have classed a bird as *Chlorospiza korarukihia* our modern friends do not stamp this name as erroneous, because those silly Dutchmen wrote the name of the bird as it is pronounced, instead of spelling it, etymologically. *Kaharu-kiha*, as Messrs. Blakiston and Pryer have it.

What prompts me to write to you is, however, not a desire to enlarge on the subject of transliteration. It is now almost superfluous to exhort oneself to annihilate the "etymological system": it is patent to the most superficial observer that this peculiar system is on the point of committing suicide. But what I would like to mention is that, considering the authors

of the paper referred to have taken so great pains with the Japanese portion of their compilation, one might naturally have expected them to bestow a little more care on the language of their own country. Such niceties as commas are largely dispensed with by them, and we meet with such elegant sentences as:—"All species included in the following list have the authorities on which they rest stated;" and:—"There are two specimens which may be distinct in the Hakodate Museum." We meet with still worse specimens of English than these; take for instance the passage on p. 175:—"The Mandarin Duck, although having a wide range, is quaintly beautiful and not uncommon: the Falcated Teal, and when flying in the sunlight, the Japanese Ibis. (Ibis Nippon)." Where is the verb in the last sentence? and what do the authors want to say about the Teal and Ibis?

In one place mention is made of what must be a strange looking bird, whose "head and neck resemble the Night Heron;" but still more wonderful is the bird laying eggs "that resemble the lapwing."

On page 234 we are introduced to a small bird called Kamschatka, of which we have not heard until now. The description given of it is somewhat obscure, but somebody among your readers may be able to explain it. The description runs:—"It is quite possible that the Scarlet Grosbeak, *P. erythraea*, Pall, which ranges across Siberia as far as Kamschatka—a much smaller bird—may also be found in Japan."

In several places the authors give us what appears to be rather imperfect information. Thus when on p. 237 they say about a bird:—"This is the *Bubo Maximus* of most authors inhabiting Europe and Asia," one naturally asks:—What is it called then by the authors inhabiting America and Australia? Again, when on page 221, under *Cettia cantans* we find:—"Commences to sing about Toukiyau the last week in February," we at once feel curious to know, what that bird sings about during the other weeks of February. Perhaps about *Hiyango*, *Nitau-kusaeu*, and other famous places in Japan.

I might fill columns with similar quotations, but will confine myself to expressing an opinion that, if the authors had bestowed more care on their English and less on their Japanese, their contribution would have been a most valuable one, while at present the sterling merits of the article disappear under the ridiculous garb in which it is clothed.

Yours, &c.,

MEGANE.

Tokio, 17th June, 1880.

#### NIPPON RACE CLUB.

##### TO THE EDITOR OF THE "JAPAN WEEKLY MAIL."

DEAR SIR:—The suggestion made in your article last week on the Nippon Race Club, respecting the foundation of a stud-book, or register of half-bred ponies is one that, doubtless, will speedily occupy the attention of the committee, particularly as it is well known that most of the "half-breds" that competed at the Spring Meeting could lay claim to better parentage, and in my opinion one, at least, should have been classed as thorough-bred. This is only one of the numerous difficulties which the committee has to take in hand. Another and still greater one is the matter of *bettoes*. That these men are of the very lowest stamp in the country these can be no doubt, and the sporting foreigner is, so to speak, literally at the mercy of his *bettoes*, who come and go just as and when they please, and have a particular knack of clearing out just when they are most wanted. There are many foreign gentlemen on the committee who have repeatedly had differences of opinion with these individuals, and who can therefore speak feelingly on the subject; and with the assistance of the Japanese officials, and others who represent the balance of the committee, I should think that it would be easy to obtain some properly authorized system of registration, whereby the *bettoes* could be bound for certain terms to their employers. I am sure that many of your readers would be glad to hear that the committee is taking some steps in this matter.

Yours truly,

A SUFFERER.

Yokohama, June 14, 1880.

##### TO THE EDITOR OF THE "JAPAN WEEKLY MAIL."

DEAR MR. EDITOR:—In his answer to my letter of May 9th, Mr. Ewing declares that he did not make any claim, which is all I wished to know. As to the rest of his letter, I refer to my paper partly read before the Seismological Society on May 25th, and to be published hereafter.

Yours very truly,

G. WAGENER.

Kioto, June 11th, 1880.

#### REUTER'S TELEGRAMS.

LONDON, 14th June, 1880.

TURKEY.—Gordon Pasha has started for China.

UNITED STATES.—The Republican Convention has chosen Garfield as their candidate.

#### FROM THE "HONGKONG DAILY PRESS."

London, 3rd June, 1880.

Montenegro has determined to attack the Albanians. The Premier has made a statement concerning Cyprus to the effect that the Convention cannot be treated as non-existent, but that the island would be transferred to the Colonial Office, which would execute the necessary reforms.

London, 4th June, 1880.

Gordon Pasha has resigned the Private Secretaryship to the Viceroy of India.

## The Japan Weekly Mail.

#### NOTICE TO CORRESPONDENTS.

No notice will be taken of anonymous correspondence. Whatever is intended for insertion in the JAPAN WEEKLY MAIL, must be authenticated by the name and address of the writer, not for publication but as a guarantee of good faith.

It is particularly requested that all letters on business, relating to Advertisements, Job-printing, or Accounts, be addressed to the MANAGER.

And that literary contributions of every description be addressed to the EDITOR.

YOKOHAMA: SATURDAY, JUNE 19TH, 1880.

JAPANESE ERA 2540, MEIJI 13TH YEAR, 6TH MONTH, 19TH DAY,  
DO-YO-BI.

#### NOTES OF THE WEEK.

The M. M. steamer arrived in port on Monday last, but brought forward no later mail news than that to hand by the *Gaelic* on Saturday. The *Sunda* left for Hongkong on Wednesday, and the *City of Peking*, for San Francisco, this morning, at nine o'clock.

The *Nichi Nichi Shimbun* has published a plan of the proposed exhibition building for 1881, which will consist of six principal divisions, namely, (1) mining and metallurgy; (2) manufactures; (3) fine arts; (4) machinery; (5) agricultural instruments; (6) botany. There will also be a supplementary structure, as in the exhibition of 1877, for the exhibition of live stock. The two first mentioned sections will be located in one edifice, covering an area of 3,943 *tsubo*. The third, fourth, fifth and sixth sections, will occupy 1,293, 800, 110, and 300 *tsubo*, respectively.

The itinerary to be pursued by the imperial party along the Nakasendo traverses the provinces of Musashi from Tokio, Sagami, Koshu, Shinshu, Mino, Owari, Ise, Omi, and Yamashiro as far as Kioto. A short stay only will be made at most of the towns and villages passed through; but a more extended sojourn will be made at Kofu in Koshu, Nagoya in Owari, Tzu in Ise, and Yamada in the same province, the object of the latter stoppage being to pay a visit to the Shinto shrines in the famous groves. It is expected that Kioto will be reached on the night of the 12th of July. The term of residence in the western capital will be prolonged until the 18th of the same month, when the imperial party will proceed to Kobe, leaving that port on the 20th in the steamers which will be detailed for the purpose.

We venture to suggest to the Cemetery Committee that they would do well to take some measures to secure increased privacy and seclusion for the burial ground. We observe new graves close to the open fence on the Bluff road, a condition which is not suggestive of fitness and decorum. A hedge of trees or shrubs might be planted within the palisade, or better still this unsightly collection of posts might be well replaced by a brick wall of sufficient height. By the way, when will the new grave-yard be ready for occupancy?

Shade of Macadam, prithes infuse some of thy spirit into that congeries of expletive-provoking evil-doers, the Japanese road-

contractors, or bury them three feet deep beneath the solid metal that thou beneficently and ingeniously contrivedst! The road through Honmura and Ishikawa, which was erst a succession of mounds and ravines and excavations large enough for rifle-pits is now one horrid bog peppered with rocks. It is being "mended" with marly gravel and prodigious stones; and the recent rains have done their destined work effectually. A tramp through an equal length of Norfolk turnip-fields, after an equinoctial deluge, would be as a promenade through Elysian fields carpeted with asphodels, in comparison with a tramp from the Ishikawa hill to the Yato Bashii.

A large and fashionable audience assembled at Ueno, last Saturday afternoon. The weather was dull but fortunately the overhanging clouds withheld their showers, and the numerous visitors from Yokohama had no cause to regret their excursion. The programme consisted of a selection of instrumental music by the Naval Band, interspersed with part-songs by the Tokio Gesang-Verein, all under the direction of Mr. Eckert. We cannot praise too highly the performance of the band: the excellent training by the late bandmaster, Mr. Fenton, and by the present one Mr. Eckert, (who has in a great measure reaped the fruits of his predecessor's labors) were most apparent in the Concert-Polka of Menzel. In this number the solo performances by two members of the corps were of such excellence, as to show them worthy rivals of all but the very best European or American players. This was undoubtedly the best-performed piece in the whole selection. Zikoff's Fantaisie was taken too slowly and lost much of its charm by the "echo" being played in the midst of the principal band, instead of detaching some players for the purpose as intended by the composer. Spindler's Husaren-ritt, also lacked a little fire and spirit, while the old "Blue Danube" waltz was the worst of all; being played in a slovenly style which formed a marked contrast to the otherwise excellent work performed. The Gesang-Verein—a society of German amateurs—kindly contributed some charming part-songs by Spöhr, Mendelssohn, etc. These gentlemen were at a great disadvantage with respect to the acoustic properties of the auditorium. The open air is not always favorable to vocalisation, especially when the only sound-board consists of a slight trellis-work, dotted here and there with vine-leaves. We hope to hear the society ere long under more favorable auspices, for even the verandah, to which the members adjourned, is not so good a *locus* as a hall or concert-room. Our best thanks are due to all concerned for affording us so pleasant a relief from the "weary round of life;" and we are above all things happy to learn that the very excellent charitable institutions of Tokio will benefit to the extent of some seven hundred yen. Could not the committee repeat the experiment in Yokohama?

The sketch of the life of the Republican candidate for the Presidency which we published last Saturday was taken from the *Philadelphia Weekly Times*.

A writer in the *Whitehall Review* says:—"I hear of an act of Vandalism perpetrated in Egypt. Tourists are so mutilating the pyramids and carrying away souvenirs that these venerable structures will ere long be literally things of the past, and the worst of it is that this work of destruction is countenanced—if one may believe rumour,—by the Khedive himself, who has thus discovered a novel method of replenishing his coffers. No man would, of course, care to have a whole Pyramid in his garden, but a part of one would be pleasing. Built by Cheops, destroyed by Cook! What are we coming to? While there is time let us buy a Sphinx for the Park."

The *Volga* brought no news of importance from Europe that has not been already anticipated by the *Gaelic*. From Afghanistan we learn that the grasp of England is gradually tightening upon the country, district after district being reduced to submission and the tribal gatherings dispersed. A daring feat is recorded of Captain Quinn of the 1st Madras Native Infantry, Commandant at Barikab, who made a most successful capture. On hearing that a convoy was being looted, he went out with ten sowars, recovered the plunder, and disarmed and brought in over fifty of the raiders as prisoners. They were all armed, but gave up their arms when ordered to do so, apparently imagining that a large force was in close proximity.

We also notice in the *Strait Times* that:—"On the morning of the 3rd May, Colonel Sanner, commanding at Khelat-i-Ghilzai, and Major Biscoe, Political Officer, surrounded three villages, six miles from the fort. The villages were reported to contain stores, looted from convoys. Two were found full of *but*, and their headmen were secured. On the return of the party, which numbered 250 bayonets, towards Khelat, their road was barred by two bands of Ghazis, one of which, eighty in number, took up a position on a precipitous hill commanding the road. This was stormed by the Baluchis with great dash, and the loss of only one sepoy wounded. Fourteen Ghazis, including the leader, a Kakar *moallah*, were taken. They were all fanatics of the Durani tribes on the Arghistan. No Ghilzais were among them." These constant defeats must in time break the spirit of the Afghans, and convince them of the hopelessness of continuing the struggle. The way will then be open for carrying out the policy of Great Britain and securing India from attack in the direction of Afghanistan.

By the American mail, news has arrived of the death of Sir John Goss, the well known organist and composer, on the 11th of May. Sir John was born at Fareham in the county of Hants in 1800, and was a pupil of Thomas Attwood, whom he succeeded as organist of St. Paul's in April, 1838. It was as a composer, however, as much as an organist that the name of Sir John Goss became famous in England. "He 'Te Deum,'" and the anthem, "The Lord is My Strength," performed at the Thanksgiving service held in St. Paul's Cathedral, February 27th, 1872, in commemoration of the recovery of the Prince of Wales from a dangerous sickness, were composed by him and gained for him a knighthood. In that year he resigned the post of organist in St. Paul's. He is the author of many orchestral compositions and in 1852 composed a dirge for the burial of the Duke of Wellington. His later compositions include the anthem, "Praise the Lord, O my soul," written for the bicentenary festival of the Sons of the Clergy; "Wilderness," and "O Saviour of the World." He was made Doctor of Music by the University of Cambridge, June 1st, 1876.

The Reuter's telegram published in this issue, stating the fact that Colonel Gordon had left Europe for China, was a little startling in view of the previous announcement that he had been appointed Private Secretary to the Viceroy of India. Here, as is so frequent, we are ill served by Baron Reuter, who had omitted to let his subscribers in this locality know that the distinguished officer had resigned his recent appointment, as will be seen in a telegram reproduced from the *Hongkong Daily Press*. Colonel Gordon's resignation of his Indian office, and his prompt subsequent departure for China, constitute a strong probability that he has consented to resume service in the employ of the Peking Government.

Five days after intelligence was received in Tokio and Yokohama of the nomination of General Garfield as Republican candidate for the Presidency of the United States, Baron Reuter was kind enough to inform his Yokohama subscribers of the fact. If this is not as it should be, it is at least according to the precedent established by the great telegraphic agent.

On Wednesday morning at about four o'clock a fire broke out in Matsukage-cho, a street in Karafuto facing the Public Gardens. Although there was little or no wind at the time, about ninety houses were destroyed before the conflagration was extinguished.

It may interest lovers of shooting to learn that on Friday and Saturday last, and at least one day this week, chicken pheasants were offered for sale in the market.

The *New York World* has an account of the recent discovery of smuggling at one of the barriers in Paris. It is stated that a Jersey wagon continually entered and left the city. It was empty. The customs' officers were always told no dutiable article was in it. A rapid inspection was made; nothing could be seen; it was allowed to enter. But one day an inspector made sure he smelt a rat, a toper of a rat, whose breath was ever so strong of—coffee, so he looked and he smelt, he smelt and he looked, and at last he found the roof of the Jersey wagon was double, was lined with zinc and filled with brandy,

held in a tank six feet long, three feet wide, and three inches thick. A few days before another stratagem was detected, a toy maker, domiciled in Paris but with his manufactory outside, continually sent these Jersey wagons, filled with toys from the manufactory to his shop. The first Jersey wagon was carefully examined—nothing. The second was superficially examined. The third—what in the deuce can the fellow mean by sending three Jersey wagons all at once?—was suspiciously examined. This is just what the toy maker expected, but the day the inspectors took it into their heads to dismiss the first Jersey wagon summarily and to examine closely the second, they found hobby-horses, dolls, Punch's hunchback, and drums, all filled with alcohol.

A new device for the bothering of lovers was "operated" successfully in a third class railway carriage by a heartless young man in Wales recently. A couple sat on the seat before him. The lady was young and modest, and the swain wore very large cuffs. One arm was thrown carelessly along the back of the seat and upon this the evil-minded person behind put some phosphorus. The affectionate performances of that cuff when the train was rushing through the kindly darkness of the tunnels were beheld by all the unfeeling and tittering occupants of the carriage, whose cruel enjoyment was not a little increased by the demure and unconcerned appearance of the lovers each time the train dashed again into the light.

The annual meeting of the New York Petroleum Exchange was held on Monday, May 3rd, the President, Mr. George H. Lincoln, in the chair. We read in a New York journal that "there was a good attendance of members, and much interest was manifested in the proceedings. The President in his address congratulated the members on the success of the organization, and said that no greater assessment for the present year than \$35 is required from each active and associate member to meet current expenses. The past year has undoubtedly been the most eventful as regards petroleum, of any in its history. The production has steadily increased from 52,000 barrels in April, 1879, to the almost incredible amount of at least 72,000 barrels at the present time. Our stock of crude held in pipe lines at the oil region has also largely increased, being now estimated at 10,500,000 barrels, as against 6,500,000 barrels one year ago. As compared with former years, the present production and stock would appear to be something appalling, did we not consider our large and increasing consumption, probably now fully 40,000 barrels per day. The fluctuations in crude during the year 1879 have been very marked, declining from \$1 10 to 63½ cents, and advancing to \$1 24½ and since declining to 71½ cents, which, for speculative purposes, has certainly offered the greatest opportunities. Combined circumstances during the greater part of last year enabled foreign countries to obtain petroleum at a lower price than ever before, and that they were not slow to avail themselves of it is shown by our large exports. By reason of an over supply then taken, our trade is now feeling the effect in its present dullness, but the result must be an increased consumption."

#### DEPARTURE OF THE MIKADO.

(From our Special Reporter.)

Not many years since the Mikado was kept in strict privacy. Now, however, we find the present occupant of the throne of Japan visiting various portions of his dominions in the same way as the sovereigns of Europe, but in the present instance amid the rejoicing of his subjects, with whom reverence for the Mikado is a tenet of faith. On two previous occasions His Majesty the Emperor Mutsu Hito has travelled through portions of Japan with a view of gaining a personal acquaintance of his country, and yesterday (16th) he set out on a third tour which will include Kioto, the surrounding districts, and the adjoining provinces, the return journey being probably made by sea in one of the corvettes of the Imperial Japanese Navy. The morning fixed for the departure of His Majesty was dull and cloudy, but, notwithstanding the threatening weather, crowds of people flocked towards the Akasaka palace from an early hour, and thronged the route appointed for the Imperial procession. The streets were lined with soldiery of every arm of the service, infantry, lancers, horse and garrison artillery, and the Imperial Guard

from the palace to the botanical gardens, and a clear space was kept for the cortège. A profusion of national flags was displayed from the houses along the route; and that portion of Tokio was altogether *en fête*. At 7 a.m., the hour fixed for the departure of His Majesty, expectation was of course on tiptoe; and, almost on the stroke of the clock, the trumpets of the Guards were heard blowing a shrill blast, and the gates of the palace were thrown open. The troops came to "attention," and the carriages containing the members of the procession began to emerge from His Majesty's residence in the following order:—Officers of the Household, ex-Daimio and Ministers of State, including His Excellency Admiral Enomoto who looked every inch a commander of men, their Excellencies Generals Oyama and Yamao, and Mr. Soyeshima, His Majesty's adviser: Eleven Inspectors of Police; Detachment of Lancers of the Guard; The Imperial carriage, containing, in addition to His Majesty, who seemed extremely well, His Excellency Tokudaiji, Minister of the Household Department; Her Majesty the Empress, accompanied by a Maid of Honour; Her Majesty the Empress-Dowager, similarly accompanied; Ladies of Honour;—it was universally admitted that the Empresses and their attendants looked charming in their white robes and tasteful head dresses;—Detachment of Lancers of the Guard; His Imperial Highness Prince Arisugawa; His Imperial Highness Prince Arisugawa, the younger, in the uniform of an English Naval Cadet; His Imperial Highness Prince Kita Shirakawa; His Excellency Sanjo, Prime Minister; Drs. Ita, Ikeda, Hayashi and Matsumoto.

At this stage His Imperial Highness Prince Higashi Fushimi, in full uniform as commander-in-chief of the Household troops, dashed past on horseback where I was standing, and took up the position originally assigned to him near His Majesty's carriage.

His Excellency Iwakura, Junior Prime Minister; The Councillors of State, including His Excellency General Yamada (who seemed in ill-health) Their Excellencies Terashima, Ito, and Oki, His Excellency General Saigo, looking the very picture of good humour and jollity, His Excellency Admiral Kawamura, and their Excellencies Okuma, Nabeshima and Nagaoka, the two last named being Ministers to Foreign Courts; Six led horses for the use of His Majesty, the first, a beautiful bay, had crimson housings with the Imperial crest—the chrysanthemum—worked in gold, the remainder puce housings, also with the crest in gold; A number of light vans bearing the Imperial crest and apparently containing provisions.

A number of notables on horseback also accompanied the procession and, what detracted greatly from the appearance of the pageant, some jinrikisha. Nothing more ludicrous can well be imagined than an official—presumably of high rank, as he was almost smothered in gold lace—gravely seated in a dilapidated jinrikisha drawn by two ragged coolies, preceded and followed by handsome and well-appointed equipages. I was informed that the procession would proceed intact as far as the botanical gardens at Naito-Shinjiku, where His Majesty would tiffin and bid farewell to the Empress and Empress-Dowager, who would then return to the Aoyama palace, the Emperor continuing his journey with a small retinue and an escort furnished by the Lancers of the Guard and the police. The first day's stage has been fixed at ten *ri*. I cannot say I was favourably impressed with the appearance of the troops, their arms and accoutrements were very badly kept, clothing ill-fitting, and the shako worn by the Guards is not well adapted for service, although showy enough. As to the marching of the Guards when returning to barracks in "fours," it was more like a "go as you please" walking match than anything else. The horse artillery looked far more serviceable than any of the other corps. I noticed a very foolish proceeding on the part of an artillery officer: he brought his men down a narrow lane—not twelve feet wide—crowded with women and children; how they escaped without a number of serious accidents will for ever remain a mystery, as several of the horses commenced plunging in the midst of the mass of people. However, everything passed off without mishap to mar the morning's enjoyment, and at about eight o'clock the immense assemblage of people dispersed, some to their usual avocations, others to enjoy a holiday, these latter being

grievously disappointed as it came on wet during the forenoon and continued raining all day. One thing struck me during my trip to Tokio, and that is the want of a hotel where foreign visitors will receive the accommodation they require, accompanied by civility and a desire to oblige. There is of course the Seiyoken, but as that establishment has a monopoly of the business, the ostensible proprietors naturally seek to please themselves and not their guests. In the Ueno branch establishment, on Tuesday, the manager refused to change ten dollars into kinsatsu except at a rate of discount four per cent less than Yokohama quotations, or to give single paper yen for a ten yen note unless he got an allowance of one per cent; these exchanges were asked for with the object of paying an account at the hotel. It will take more than influential proprietorship to keep the famed Seiyoken in its present prosperous condition, if the incidents I have mentioned are frequent in its management, and the numerous complaints heard among foreign visitors to Tokio shew that a wide field exists for improvement in many important particulars.

### SHANGHAI LETTER.

Shanghai, 8th June, 1880.

The Margary Memorial is at length completed and looks very effective in its position at the corner of the reserve garden and between the British Consulate and Soochow Creek bridge. Advantage has been taken of the opportune arrival at Shanghai, on his way to Peking from England, of the Hon. J. G. Grosvenor, C.B., H. B. M.'s Secretary of Legation, to uncover the memorial with some ceremony, and to-morrow afternoon has been fixed for this purpose. It is very appropriate that this duty should be performed by Mr. Grosvenor, as he headed the expedition that was sent by the British government to make enquiries into the death of Margary. I cannot yet give you any description of the memorial as it is covered up pending the unveiling to-morrow.

Our volunteers have been quite active of late under the new commandant, and have not only come out in bright scarlet uniforms and white helmets, but have been energetic in drills and parades. This has inspired some of the riding men to resuscitate the Rangers, though many of the old members of the corps, knowing perhaps how hopeless it is to look for a second Markham, hold aloof from the new corps, which is therefore composed, as a rule, of late comers. The formation of this corps is not looked upon with unmixed pleasure by the infantry, who rather view the Rangers as a source of danger at a general parade, and think they have quite enough excitement with the artillery corps, and their gun that never will go off at the right time.

I saw by the Japan papers that some short time ago certain Yokohama residents were summoned for non-registration, and that to avoid a fine they were obliged to register at once and pay the fee for the summons. This is in contradistinction to the course adopted here, where no effort is made to enforce registration, so that many British subjects dispense with that formality, and do so with impunity unless they are compelled to seek Consular assistance, in which case registration is suggested and followed. But you may imagine how many now never trouble this heads about this objectionable Order in Council, and it would perhaps be more reasonable that it should be as quietly revoked as it was at first imposed.

We have had quite an exodus of American men-of-war within the last few days, as the *Richmond*, *Monocacy* and *Ashuelot* have left us after a lengthened stay in this port. We shall particularly miss the *Richmond*, as the band of that vessel was so constantly and kindly placed at the disposal of the community, either at public or private gatherings. The *Ashuelot* has undergone such extensive repairs at Boyd & Co.'s yard that she may be considered a new vessel, and after the summer the *Monocacy* is to go through a similar transformation. To most people the wonder is that the large sums expended on repairing old and comparatively useless vessels are not devoted to the purchase of one that could hold her own with the fine men-of-war of other nations. But the heathen Chinese has no monopoly of "peculiarity." The Spanish corvette *Dona Maria de Molins* is now the only man-of-war here that possesses a band, and that we constantly have an opportunity of hearing, thanks to the courtesy of Captain Olleross. The musicians are all Manila men and they play capably, and as they have no end of peculiar Spanish airs in their repertoire, their performances have in a great measure the charm of novelty. H. M. S. *Encounter* arrived here from the south on the 26th of May, and will probably remain here through the summer. We have besides in port H. M. S. *Lily*, and four Russian gunboats.

Every now and then there is a scare among Chinese merchants about Russia, but yet it is difficult to make any of them understand how serious a business for China it will be if war is declared,

or how easy a conquest Russia is likely to find it. As the trade of the ports was not generally interfered with during the war with England, the Chinese do not realize that it is in the power of Russia to blockade all her principal open ports, as will doubtless be done, for no one can imagine that any tender regard for the trade of other nations will induce Russia to leave the enormous carrying trade of this port unmolested, to say nothing of that of the others. Some short time ago the *Courier* published the translation of a document purporting to be a memorial from Chang Chih Tung to the Chinese Government, boldly urging decisive measures with Russia. A certain amount of mystery surrounded this document, and it was supposed to have been obtained in a surreptitious manner, so that its publication in a foreign journal excited the wrath of the Taotai. It was certainly a startling document, and has obtained notice from the foreign press in the Far East generally, while its publication in the *Courier* led to a rather acrimonious discussion in the columns of another of our papers on the merits of the *Courier's* translation, and finally the production of a revised translation. Now comes a letter from the Peking correspondent of the *Mercury* saying that this Memorial was known of in Peking months ago, and was intended to serve the purposes of the anti-foreign party, but that on closer examination the Tsung-li Yamen found that the wording of the document was such as to preclude it being used as the anti-foreign party desired, as instructions to Marquess Tseng, and it was therefore laid aside. This course, it would seem, did not suit the anti-foreign or war party, who therefore circulated the Memorial as much as possible all over China in the hope of exciting the native mind, and that the difficulty experienced by the *Courier* in obtaining a copy, was only part of a clever trick to induce the publication of a translation of the Memorial and to ensure attention being called to it. This is all we know at present, but further discussion may take place in the papers about this celebrated document and more light may be thrown on the subject.

The chaa-zees are returning from Hankow, as ten steamers have already left that port full of tea. The *Glenora* had a good start, as she passed Woosung on the 23rd May, and loaded at the top rate, £6.10 per ton, the *Londoun Castle* being next with a cargo at £5.10, but did not pass Woosung until the 27th May. She was followed on the 30th by the *Glenartney*, filled up at £5, and on the 1st instant by the *Glenarra* at £4, all of which are excellently paying rates. Since then the *Afghan*, *Heuparia*, *Achilles* and *Tibre* have passed out for London with cargo at £3.5 and £3 per ton, and the *Petersburg* and *Muskova* for Odessa, leaving the *Glennia Castle*, *Galley of Lorne*, *Cairnmuir*, *Hankow* and *Malabar* at Hankow, some of them loading at reduced rates. The steamers must have had an anxious time at Hankow, as a succession of freshets down the Han put them all in more or less danger. The *Petersburg* got ashore and had to pay Tls. 10,000 to the river steamer *Hankow* to tow her off; the *Achilles* also got into serious difficulties and had to be assisted by the *Shanghai*, and the *Breconsaire* did herself so much damage by drifting down on the *Muskova* and subsequently going ashore, that she had to discharge the cargo she had on board, and is to come here to be docked and repaired.

Some of the interested parties do not speak hopefully of tea this season, but we must wait until the arrival of the first tea in London, before the prospects are at all definite. Tea has certainly been bought at cheaper rates this year than last, the total settlements up to the 4th instant, being 577,800 half chests against 588,230 half chests for a corresponding period last year. If the reception of these teas at home could be the same as last season what a grand thing it would be for Shanghai, but there can be little hope for this.

On the 16th instant, at a general meeting of ratepayers, the schemes for supplying the settlement with water will be submitted and probably decided upon. Messrs. Morrison, Kingsmill and T. W. Waters, have all plans for supplying water to the residents of Shanghai based on the supposition that the Municipal Council will have the management of the supply in the public interest, and on these grounds one of the schemes is likely to be selected by the ratepayers. The promoters of the scheme, however, desire that it shall be in the hands of a private company, which is objectionable in many ways, and it is to be hoped that such will not find sufficient supporters among the ratepayers. In connection with this water supply, Mr. J. W. Hart, formerly of Japan, has lately arrived here from England. I hope in my next letter to be able to let you know, how and when, we are to obtain the boon of good water laid on to all the houses of this settlement.

### LONDON LETTER.

LONDON, 25th April, 1880.

Like many better men I have to own myself knocked out of time, so to speak, by the general election, now mercifully over. For weeks one has been able to talk, think and dream nothing else. The streets seem to echo the shouts of the visitors and the groans of the vanquished. One cannot turn a corner without seeming to feel the hand of the canvasser on one's shoulder and his warm breath in one's ear. He sits on us like a nightmare

in the silent watches of the night, and the phantasmagoria of placards, address flags, coarse caricatures, and the tag rag and bobtail of electioneering camp followers worry us in our dreams as if we were in a fever. The excitement has indeed been intense: many people have died of it and probably many more will die hereafter, like Lady Macbeth. But what is the upshot of it all? An enormous liberal majority, so large as to make the new government, which will immediately replace Lord Beaconsfield's, independent of all its factions and the strongest government that the country has had for fifty years. And how has it all come about? That is what all the papers have been trying to tell us the last three weeks, and it is much too wearisome to be amusing to follow them through their mazes of conjecture and mare's-nest hunting. None of them know anything about it more than this:—that a vast mob of people, mostly ignorant and illiterate, have voted against the government. That they have been swayed by the torrents and floods of liberal eloquence that have spread over the country for six weeks past from Mr. Gladstone to Mr. Labouchere's and Mr. Bradlaugh's is certain, and, so far as mere talk has influenced the result, it is a fact of evil omen for the future of English politics, for the talk has been of the purest *ad captandum* style, with the almost single exception of the speeches of Lord Hartington, the official leader of the opposition. No statement was virulent enough, no colouring of facts strong enough, no denunciation of Ministers reckless enough, to disgust the electoral body. But, unfortunately, the consequences of feeding the populace on such highly seasoned dishes will be that they will henceforth disdain wholesome food, and each successive appeal to the people will be accompanied with a species of oratory more and more degrading to the orators, for neither side can afford to surrender this powerful weapon, and the competition for the favour of the ignorant will deteriorate English public life gradually to the level of that of the United States. There have been, as I have intimated, some exceptions to the ardent vituperative style of oratory, and chief among these must be classed Lord Hartington's speeches. Perceiving early in the contest that his party was sure of victory, and that consequently he would soon be called upon to assume a share, if not the leading part, in the Government of the country, Lord Hartington endeavoured to neutralize the effect of Mr. Gladstone's speeches by declaring that his policy would be exactly the same as Lord Beaconsfield's, and that the only difference would be that, whereas Lord Beaconsfield had failed in carrying out his own policy, the liberal government would succeed in doing so. By these moderate doctrines Lord Hartington gained for his party the support of all the Whigs or moderate liberals. Mr. Gladstone was all the while denouncing both the policy and the tactics of the late government, and he thereby secured for the liberal party the support of all extreme men, who only unite in a common hatred to the Tories. These extremists belong to a number of classes the most important in point of numbers being the non-conformists, who hate the Church of England; the peace-at-any-price men, the doctrinaires who, if one could believe them, would have the country governed in such abstract principle as Comtism or republicanism, or some other *ism*; and the classes which discard religion. To the last belongs Mr. Bradlaugh, who has got into parliament by the aid of Mr. Samuel Morley, who, however, repudiated his protégé after the election. Mr. Bradlaugh explains in his organ, the *National Reformer*, that he has been sent to Parliament, not as an atheist, but as a radical. His colleague is Mr. Labouchere, the editor and proprietor of *Truth*, and hero of many libel actions and journalistic horse-play. Mrs. Annie Besant, a lady of some notoriety, thus comments on the result of the elections:—

"The watchword of Liberalism has long been: 'No penalty on speculative opinion'; but the penalty disavowed in word has been inflicted in act. During this election the attempt has been made more strenuously than ever to defeat Liberal candidates by accusations of atheism: never made more strenuously, never has it more conspicuously failed. Professor Bryce was labelled atheist: Tower Hamlets returned him at the head of the poll. Mr. Firth was stamped infidel: Chelsea sent him to Parliament as honored colleague of Sir Charles Dilke. Mr. Broadhurst was said to be unsound: Stoke preferred him by thousands of votes to his religious opponents. Mr. Ashton Dilke was said to be supported by a secularist gang: Newcastle bade him go to Westminster side by side with Joseph Cowen. Against Mr. Bradlaugh, clergy preached, hypocrites ranted, pietists wrote: Northampton answered by giving him nearly 4,000 votes of confidence. Colonel Chaplin had proved his faith by aiding a parson to rob a mother of her child because of the mother's heresy: Lincoln told him that even a cathedral city would have no persecuting bigot for its member."

The question is eagerly asked what, after all, will the new Government do? In home affairs of course their programme is pretty well defined, and it is probably not very important. But what of foreign affairs? Austria is uneasy in consequence of Mr. Gladstone's attack on her Government. Germany is uneasy, and so is even France. On the other hand Russia is jubilant. She sees visions of the abrogation of the Berlin treaty. The

Bulgarian nationalities are agitating to take Mr. Gladstone at his word, and get the Turk finally placed under their Christian feet. Italy is watching, ready to profit by any disturbance that may turn up. The question is whether will Mr. Gladstone in power ent his words spoken in opposition, or plunge into all the enterprises which he denounced the Tory Government for not undertaking. Were it any ordinary politician one would answer such a question easily by applying the maxims of common sense to it. But Mr. Gladstone is a man who has the courage of his opinions, and though his opinions on European affairs were formed out of his hostility to the Government, yet the opinions are now fixed and fortified by many and strong *ex post facto* reasons.

Russia continues to be greatly distracted in her plans. Her Turkoman campaign has become much attenuated since the contingency of having to fight China for Kuldja has come up. Both countries are equally weak on that frontier, and neither could do the other much harm. But China is vulnerable by sea, and Russia is anxious to induce the Japanese to pull the chestnuts out of the fire for her. To get China and Japan to quarrel is the first aim of Russian policy at present. She would take neither side until she saw how the war proceeded, and then it would not make the smallest difference to her which side she took. Yesso and Corea, possibly also the provinces of Shantung, would be Russia's share of the spoil in any case. As the ally of Japan she would claim Yesso as her reward. As the enemy of Japan she would demand it as her indemnity. And so with China and her territories. Maritime Russia is fitting out a large squadron for China and Japan waters, shewing clearly in what quarter she intends to operate in case of war.

The Chinese Ambassador to London is about to proceed to St. Petersburg to reopen the Kuldja question. Let us hope that he will have his labours better appreciated than Chung How has had his. That unfortunate official has not been able to make the Nemesis of the Christian martyrs of 1870, for whose fate he was so largely responsible.

Honours are following thick upon the heads of Lord Beaconsfield's political friends. The suddenness of the collapse of his government has left him not time to cover his K. C. B.'s and his peerages to wealthy Tories with a veil of decorous deliberation. It is like the shaking of an apple-tree bearing over-ripe fruit. His Lordship bears his defeat with the same inscrutable demeanour as he bore his unnatural prosperity. An extra flower in his button-hole, an extra polish on his boots, delicate spring-tinted gloves, and the smartest of gold-headed canes are all the external symptoms of grief which this seventy-five-year-old man exhibits to the world. One of the strangest phenomena of the time is the impenetrability of this man's character. He has been continuously before the world since he was eighteen, a copious writer of fictions, a keen controversialist in parliament, a butt for criticism of the most unsparing kind, without any intermission, for fifty years, yet he remains as complete a mystery as ever. His critics have never got much beyond his white waistcoats and the curls of his hair. They have never reached the man. Biographers puzzle themselves over this man, living amongst us, in the full blaze of nineteenth century publicity, just as they might do over the character of Shakespeare, or Charlemagne. To call him a mountebank and a charlatan, obviously does not exhaust the subject, yet that is about all that Lord Beaconsfield's enemies can formulate against him, excepting that he is of Hebrew origin, which nobody can deny. Carlyle calls him "miraculous," and "the man they call Dirty," but neither of these sage epithets help us to understand this inscrutable man. I gave it up long ago. Mr. Gladstone is a complete contrast to his great rival. He is constantly turning himself inside out before the public. Every passing shade of opinion is at once photographed on post-cards, and in magazine articles: and you can follow the workings of his mind—and a mind of portentous activity it is—in every detail, if your life is long enough to read his speeches, spoken and written. He lives under glass, and takes everybody into his inmost confidence. He is always overflowing with emotion. Every time he speaks is the happiest and proudest moment of his life, and this broad-cast sympathy, fired with almost preternatural fervour, has gained for him the hearts of the sentimental section of the population, and that in spite of a serious defect in a popular favourite, the absence of the quality of humour. The "surgical operation" of Sydney Smith would fail to convey the idea of a joke into Mr. Gladstone's mind: and his imperviousness to humour often enables frivolous persons to "take a rise" out of him. His infinite good nature in answering letters of the most irrelevant kind has been greatly abused—men often concocting some caustic problem for him to solve, and betting on his answer.

## PARIS LETTER.

PARIS, April 24th, 1880.

Spring is coming, and if not with honey for the bee, at least with abundance of lilac for Parisians, this flower being as plentiful as the pyramidal white and carnation blossoms on the

chestnut trees. Perhaps in this *sursum corda* might be included the young girls that dot the streets, all dressed in white veils and tulle, going to be confirmed. Their elders are said, "to church repair, not for the doctrine, but the music there," and not a few from fear of Mrs. Grundy—a lady happily unknown in France, or if so, as amusing as the *Mère Gigone*. But these "children in white," do feel all that is ennobling, hopeful, and fortifying in religion. There are few free-thinkers in France, who do not see with a secret satisfaction their wives insisting on this early marriage of their children with the church, as it creates an impression that, no matter how it may be disguised in after years, can never be wholly effaced. The only drawback to this highly civilizing ceremony, is the mundane weakness displayed by parents to deck their little ones in too costly apparel, as the youthful mind is apt to think fine feathers will make fine souls. The evil is less notorious in the capital than in the provinces, where a first sacrament is associated with rich stuffs, jewellery, and flowers. A toilette solely in tulle, with a muslin veil and a Tom Thumb border of Valenciennes; a prayer-book in red or blue binding, in a sac of white satin or moire; a purse in fossil ivory or mother-of-pearl—for the young communicant will have to pay "dues,"—and boots in white kid, form the costume for Parisiennes. The boys are in white trousers and vest, with blue jacket and white brassard with fringe; he carries a taper, emblem of eternity when lit. Both sexes wear white gloves. The music at these ceremonies is peculiarly attractive, suggestive of innocence, and what cherubim and seraphim do continually cry.

Accompanying some visitors to witness the gingerbread fair, we stopped to visit Picpus cemetery and its convent, where the annual mass was being celebrated for the repose of the souls of the 1,306 persons executed and buried here, during some 43 days of the Reign of Terror. The heads that fell here were chiefly those of the aristocracy; their order had to pay for the autocracy of Louis XIV.; the profligacy of the Regent and Louis XV, and the imbecility of that royal whitesmith Louis XVI.—the best of a bad lot. No posthumous piety is ever indulged in for the victims of the *dragonnades*, or the massacre of St. Bartholomew. Originally the guillotine did its work on the spot where the obelisk facing the entry to the Champs Elysées, is erected. There Louis XVI and Marie Antoinette were decapitated, and their bodies buried in quick lime, in the old Madeleine graveyard. Later, the site of the guillotine was transferred to the Place du Trône, and three carts conveyed each day an average of forty persons for execution. It was kept a secret where the bodies were interred, until Mlle. Paris, having witnessed stoically the execution of her father and brother, remained transfixed to the spot till midnight when the carts came to remove the corpses, and which she discovered were shot down into an old quarry at Picpus. In calmer days a convent was erected near the spot, and on the walls of the chapel are the names of 1,298 persons who perished. There is besides a small cemetery, destitute of all vegetation, where the *crème de la crème* of French society is interred—for, as a duchess who now roasts there observed, "it is a consolation to know you will rot among your own equals." Montalembert is the last who was buried in this bivouac of the dead hidalgos.

Sarah Bernhardt has taken French leave of the Théâtre Français without any cause. Her motives were, jealousy of rising rivals, and the itching to make guineas and dollars rapidly, in England and America; for this selfishness she has been sued for fr. 300,000 damages, consequent on her violated agreement. This petted and spoiled actress became actually a tyrant towards her colleagues, and indulged in several vagaries towards the public. Her nonsense having exceeded all bounds, she is now at full liberty to act in both hemispheres—or their neighborhood.

The ladies are still looking up. Mlle. Auclerc is to be a candidate for the Chamber of Deputies at the next general elections: then she will push the President perhaps in time from his stool. Mme. Koppe has started a journal called *Woman*, and very meanly solicits her masculine foes to take fr. 100 shares in it. As usual she does not inform the perverse from what her sex desire to be emancipated. Men are proud of their wives, mothers, and sisters; they consider that, after bringing up a family and looking after household duties, women have little time left either to represent their country in parliament, or defend it with a musket. In France, as elsewhere, woman will be most free and respected, the more she acts on the device, *ne sutor ultra crepidam*. Mme. Koppe is in favor of divorce, on certain conditions: however she does not enumerate a few that the Chinese recognise in their code: want of respect towards mothers-in-law; gossiping, slandering, and Toxism in general; exaggerated jealousy of husbands, and sterility.

The Comte de Sémelle could not settle down into civic life after the invasion: he was young, was an officer in the Turcos, so he made a voyage up the Niger, and brought home a Joshua report of the land to two enterprising merchants at Nantes, who have just fitted him out with a forty-ton steamer for the African exploring trade. The Comte was one day passing through a native village, and noticed an intelligent looking and handsome boy tied up; on inquiry, he was informed the lad

was being fattened, to be roasted at a coming *fête*: the Comte bought the lad for a case of Old Tom, and he is now at school in Paris astonishing the natives by his capacity.

There is a decided change coming over the habits of society here. *Matinées* are on the increase, to the delight of those who detect evening attractions and late hours. The Comtesse d'Haussonville has resumed her Thursday literary *matinées*, which have this peculiarity, that blue stockings are excluded. Such *refusées* must seek refuge in the republican salon of Mme. Adam. The countess is sister of the unpopular Duc de Broglie: her husband is deaf, and is an Academician and senator. He was called upon the other day by a publicist to solicit a favor: he replied rather rudely to the request, and begged the visitor to speak loud as, "I am deaf, but that infirmity spares me from hearing a good deal of stupidities." "Do you speak, Monsieur, as an Academician or a Senator?"—was the tart reply.

That young fellow, aged 75, the Comte de Lesseps, is indefatigable. He passes his days working at the Isthmus of Panama scheme, and his evenings lecturing about his recent voyage across it, and though the United States. On Thursday he was entertained at a sumptuous dinner at the Continental Hotel, by the chief bankers and financiers of the capital, he spoke for an hour with remarkable verve and lucidity. He has no doubt of being able to carry out his plans, despite the only obstacle now existing—the attitude of the United States, and every one here feels he will succeed, and so reap fresh glory for his country and increased fame for himself. The hall was splendidly decorated, and the Stars and Stripes were as conspicuous as the tricolor. I observed M. de Lesseps lives very abstemiously, and at midnight was chatting away as vigorously on all topics, as when he welcomed you with a cordial shake-hands and a compliment, five hours earlier. He divides the isthmus, he says, to unite humanity.

Field sports continue both to naturalize and democratize in France: thus at the recently re-established races at Croix-de-Berny, in a race where only gentlemen riders figured, the son of a retired merchant, M. Contourio, won. There was a good deal of conversation in the stand about the coming marriage of the King of Bavaria, with his cousin the Princess Isabelle, aged seventeen, and whose trousseau is in hands here. It is to be hoped that she will not be jilted like another cousin, the Duchess Sophia, whose outfit was completed, the wedding dress tried on, but on the eve appointed for signing the contract, the King had disappeared. The Duchess, who is sister of the Empress of Austria and the ex-Queen of Naples, has since been married to the Duc d'Alençon, son of the Duc de Nemours. A short time ago the Duchess Decazes called to pay a visit, after a delay of twelve minutes, the Duchess appeared with her little son, apologised for keeping her visitor waiting, as she had been occupied dressing her little boy. What a contrast between sisters: the ex-Queen of Naples was a heroine at Gaëta; but since, she attires herself in jack-boots, wears a billycock hat with a large feather, a dragon's mantle, and carries a riding whip in place of an umbrella. As for the Empress of Austria, it is only necessary to turn over the comic journals of Germany to know her character. Like her sister of Naples, for her, all that is best in man is the horse. She too passes her time in teaching ponies tricks—a pastime to which the Queen of the Belgians is also addicted. In addition to a love for horses and the lady equestrians of circuses, her Majesty of Austria loves monkeys and dogs, and, when a few years ago she occupied apartments at the sea-side at Sassetal, the landlord was horrified at seeing his drawing room converted into a menagerie. Blucher at the Palace of St. Cloud was not worse.

If Louis II. of Bavaria had reigned over any other people but Bavarians, they would have given him the usual three days' notice to quit long since. He recalls the Emperors of Rome in her decadence, and the pen of a Petronius would be necessary to relate his exploits. His brother, Prince Otto, has to be kept under lock and key, and a few years ago, when in Rome, his freaks necessitated a request from the authorities that he would leave. There is much gossip afloat respecting an illustrious stranger, who sleeps twenty nights out of thirty on the floor of her boudoir. She locks herself in to enjoy "a good drunk," in her private *amuse-ment*. There is another lady the talk of the clubs for her irregular loves, as fantastic as those of Mme. Chambon, who now figures in the court, for marrying her valet and barber—good looking fellows in their day—and who practices strange flirtations to compel the capillary artist to seek a separation.

The Chamber of Deputies hardly met after the recess, when nearly its first duty was to expel a Bonapartist deputy, Godelle, for three weeks. His salary will also be stopped, and if he appears in the Chamber, he can be placed under arrest, the cause of the trouble being an insulting allusion to President Grévy.

When certain folks fall out, honest people come by their own. Paul de Cassagnac and Emile d'Ollivier, are noted Bonapartists, and exchange pot and kettle compliments the former holds Ollivier criminally responsible for the Prussian war; Ollivier accuses the War Ministers for having fictitious figures about the strength of the army. The public, however,

blames the Empire and its system of robbing the Treasury. The Clerical party has now been joined by the royalists, to resist the "decrees" calling upon the unauthorized religious bodies to conform to the code on pain of dispersion. This is a simple coalition against the Republic, to restore that impossibility—the Comte de Chambord.

The little child, Louise, aged four years, that Menescloux, the discharged sailor, aged twenty, violated, cut up into forty morsels—the two hands were found in his pocket—and then proceeded to burn in a stove and boil in a pot, had a very imposing funeral, and the remains were accorded a free sepulture. Her little companions, dressed in white, followed the bier, carrying the bouquets, from which lilac was excluded, as it was by that flower she was induced to follow the murderer.

Two men fishing for gudgeon in the Seine, on drawing their net, found it contained an iron pot, tied with cords: on opening the pot an infant was found inside.

There is a national school for boys in the War Department, in the ceiling of which for the last eight years, swallows invariably come and occupy the same nests.

President Grévy has bought a mansion for fr. 1½ millions on the Boulevard Malesherbes. Ex-President Macmahon has had to sell his town house to pay the debts he contracted when in office: he is rumored to pass most of his time cursing politicians of every hue.

Thoughts by a lady:—How many men would be loved, were they amiable? How many women would be amiable, were they loved?

French railways are to try the system of third-class subscribers.

Aunt to niece:—"If you marry an officer, he may have to go to battle and be killed." "Then I should be a widow in my teens, and that's poetical."

Purchaser to upholsterer:—"How do you account for four out of the six chairs being broken?" "I don't know, Monsieur, except some one has sat on them."

"Why do you spell *amour* (love) with two *m's*?" said one soldier to his comrade. "I know there is only one, but with two *m's*, that proves one loves more strongly."

#### ASIATIC SOCIETY OF JAPAN.

A General Meeting was held at the Shōchikuwan, Seidō, Tokio, on June 8th. Dr. Divers, President, in the chair. The election of the Rev. David Thompson and the Rev. H. Waddell as members was announced. Three members of the society were elected to serve on the committee for nominating officers and council for the session 1880-81.

Prof. D. Brauns of the Tokio University read a paper "On the Systematic Position of the Itatsi, or *Mushla Itatsi* (Temminck and Schlegel)." A short discussion followed and the thanks of the society were awarded to the author.

A paper was then read by Prof. Kinch, of the Agricultural College, Komaba, entitled "Contributions to the Agricultural Chemistry of Japan." The author began by giving extracts from some of the older writers on Japan.—Kaempfer, Charlevoix and Thunberg,—also from Siebold and other more recent writers. Green, Maron, Rutherford Alcock, Veitch, Capron, Griffiths and Le Gendre, relating to the nature and fertility of the soil of Japan. Whilst the older writers, speaking generally, though not exclusively, of the neighbourhood of Nagasaki, have for the most part ascribed the productiveness of the soil to the careful cultivation by the inhabitants, more modern writers, usually from observations near Yokohama, have propagated the opinion that the soil in itself is naturally very fertile. Much of the difference in the statements concerning the soil arises from an ambiguous use of the word fertile, which probably conveys a different shade of meaning to each individual, and moreover, in a large number of cases, the word *fruitful* would probably more accurately convey the writers' meaning. Observations on the rocks of Japan were given, with some analyses by Dr. O. Korschelt and Mr. Wm. Gowland, and it was suggested that the majority of Japanese rocks, whether Plutonic or volcanic, belonged to the acidic group. Acidic rocks appear to contain less phosphoric acid than the corresponding basic rocks, and this is a point of great agricultural importance, for there can be little doubt that of any single constituent of a soil, containing all the elements necessary to plant-life, the phosphoric acid is of most importance in determining the fertility of that soil. These propositions were supported by numerous quotations of analyses of rocks and soils of other countries. Analyses of several different Japanese soils were given with observations thereon, and, though the knowledge at present

gained on this subject is necessarily but limited, it was inferred that, for the most part, the soils were not, chemically speaking, of great fertility, though their physical properties rendered them admirably adapted for the method of cultivation pursued by the Japanese farmer. All the soils examined contained magnetic oxide of iron, though in very varying quantity: they were generally poor in phosphoric acid, lime and potash, in a readily available form. The verdure of the country is far more dependent on its meteorological conditions than on its soil. The manures of the country were next mentioned, and analyses of many of the more important accessory manures of mineral, vegetable and animal origin were given, and the availability of some of them for use as cattle foods pointed out. The author then gave some observations on, and analyses of, different kind of foods, viz:—the two principal kinds of rice, *Uruchi* and *Mochi-gome*; different millets, *Awa Kibe* and *Ijiye*; the soy bean, *Daidzu* or *O-mame*, and some of its products, *tofu*, *miso*, and *shoyu*; the *Phaseolus radiatus*, *Adzuki* or *Shashu daikon*; several kinds of sea-weeds: *saki* and other spirituous liquors and waters: and finished with some account of the fish hatching stations in this neighbourhood, and of the food given to the young fry, and of a large natural breeding station in the Maigomote-gawa, in Echigo.

In the discussion which followed, Professor Atkinson said he wished to express his indebtedness to the author of the paper for the valuable assistance which the record in the paper of so many analyses would be to him in the work he was at present carrying out. He wished to point out, however, that Professor Kinch appeared to have adopted a meaning of the term "fertile," which was not sanctioned by the dictionaries, when he applied it only to a soil which produced far more than in its natural condition. Webster's definition is, that a soil is "fertile" which produces abundantly, not that it yields products which can only be obtained by the system of "high farming" now in use. The term fertile is relative, and thus it would be quite proper to call a land fertile, which produces a luxuriant crop of wild flowers compared with other soils which do not do so, because the probability is that, if it were sown with seed, it would bear abundantly. Too little importance, seemed to the speaker, to be given to the condition, of growth other than the nature of the soluble constituents of the soil. Such substances, doubtless, fulfilled the purposes of food to the plant, but just as animals, though fed on the same diet, would turn out differently, so it was reasonable to suppose that there might be "lean kine" among agricultural products. The observations made at Mr. Lawes' farm at Rothamstead, during the last thirty-six years, and communicated by Dr. Gilbert to the British Association at its last meeting, showed how little is really yet known even about the absorption of material from the soil, for it had been noticed that, although cereals contain comparatively little nitrogen and much phosphoric acid, yet the application of nitrogenous manures to such crops was attended with very beneficial results, and that, although bean crops (*leguminosae*) contain a very large amount of nitrogen, the manures best suited to them were not nitrogenous, but potash manures. The speaker then referred to the influence of other conditions affecting the growth of plants, such as light and heat, and stated that, from observations made by Dr. Schübeler of Christiania, the almost unbroken sunlight of the short Scandinavian summer appeared to have the effect of intensifying both the colour and the aroma or flavour of fruits and vegetables, whilst the proportion of sugar formed was smaller. It appeared that the increase of aroma and colour was the effect of light, whilst sweetness was mainly dependent upon warmth. Siemens had recently suggested the employment of the electric light, and had proved that by its use the development of the plant might be much increased.

The speaker further made some remarks upon *shuyu* and the alcoholic drinks of the Japanese. He said that Mr. Isono, a graduate of the University of Tokio, had made analyses of the *shuyu murami* at various periods, and as it might be of some interest to have the record in the Transactions of the Society, he begged to be allowed to communicate the analyses. It was interesting to observe the disappearance of the glucose, and the gradual increase of the soluble nitrogen from the first sample to the last. The greatest change took place between the third and the tenth months, but, after the removal of the

greater part of the glucose and dextrin, converted into alcohol and lost by evaporation, very little alteration occurred, except in the colour of the liquid which became darker. Professor Kinch had mentioned the fact that, by the use of salicylic acid, the tendency of *saké* during the summer months to turn bad could be counteracted. This alteration appeared to be due to the presence of butyric acid ferments, and, from some experiments now being carried on, the process of heating the liquids, known as Pasteur's process, was also successful in preserving *saké*. It was a matter of great importance to possess a means of keeping *saké* over the summer, as the want of this at present necessitated the consumption of the new wine within the same year, and gave no opportunity for "ageing" by which the aroma was developed. The taste of *saké* was probably due to a solution by the alcohol of the bitter principles contained in the dead yeast cells, partly also from the solution of the resin contained in the wood of the cask, or from shavings purposely introduced. The rapid spoiling of *saké* during the hot months of the year, also prevented the export of any large quantity, and the adoption of any process which would preserve the liquor would be of great economical advantage to the country.

### JAPANESE NEWS.

[The following Notes on various Japanese matters are chiefly derived from the native papers, occasionally supplemented from original sources of information, and are carefully collated and edited, so as make them readable and intelligible.]

#### COURT, POLITICAL AND OFFICIAL.

Kwasoku Hachisuka, Superintendent of the Custom House Bureau in the Finance Department, will shortly inspect the Custom Houses at Kobe, Nagasaki, and Niigata.

Messrs. Murata and Yamazaki, left for Germany in the French mail steamer, on the 11th instant.

The official telegraphic communications to be made to the Cabinet from the Imperial procession and *vice versa*, will be in cipher.

The *Chuga Shimbu* says:—"We hear that some of the members of the Cabinet have expressed opinions to the effect that it would be better to present petitions in favour of the establishment of a National Assembly to His Majesty the Emperor. This is a very excellent proposal, but we cannot say whether there is any truth in the report."

The *Nichi Nichi Shimbu* of the 10th instant says that a telegram has been received stating that Mr. Yegi Takato, Secretary of the Japanese Legation in Washington, died at his post a few days previously.

During the absence of His Excellency Sanjo, Prime Minister, from his office, His Imperial Highness Prince Arisugawa will undertake his official duties; and Chief Secretary Tanaka, of the Home Department, will act as act as Superintendent of the Agricultural Bureau.

Mr. Sakurai, Superintendent of the Survey Office, will shortly proceed to Okinawa Ken (Loochoo) on an official tour of inspection through those islands.

The local assembly in the prefecture of Chiba was closed on the 9th instant, after successfully debating all subjects laid before the members. The new Governor, Funakoshi, inspected the different districts under his jurisdiction, on the 13th instant.

In consequence of the departure of the Imperial procession on the morning of the 16th instant, all the Government Departments closed during the day. The native journals also suspended publication.

The German Minister was presented in audience with His Majesty the Emperor, at 10 a.m., on the 14th instant.

During the Imperial progress, His Imperial Highness Prince Arisugawa, the Assistant Prime Minister, will make daily reports respecting public business to His Majesty the Emperor, by telegram in cipher.

His Excellency General Kuroda recently presented a valuable horse to His Majesty the Emperor.

The Chinese Vice-Ambassador, accompanied by two of his subordinate officers, inspected the printing office in the Finance Department, on the 15th instant.

His Excellency Privy Councillor Ito, through illness, and Their Excellencies Privy Councillor Torashima, and Home

Minister Matsukata, from pressing official business, have been relieved from accompanying the Imperial progress.

Mr. Suzuki Kinzo, a secretary of the 2nd class attached to the Japanese Legation in London, and who has been abroad for more than twenty years, returned here on the 16th instant. It is rumoured that he will be appointed Vice Assistant Minister of Foreign Affairs.

The *Akebono Shimbu* says it is currently reported that His Excellency Inouye, Minister for Foreign Affairs, will be appointed Envoy Extraordinary and Minister Plenipotentiary to the Court of St. James, and that His Excellency Yanagisawa, Minister to the Court of St. Petersburg, will be transferred to Washington, and all the other diplomatic agents removed from their present posts to others. The *Akebono* remarks that it does not place any credence in the rumour.

Yesterday, the 18th instant, being the thirtieth day since the opening of the local assembly in Tokio, it was to have been closed, but as the questions laid before the members have not yet been thoroughly discussed, they came to the conclusion that they would apply for an extension of thirty days more.

His Excellency Yoshii, Vice Assistant Minister for Public Works, was promoted to the rank of Assistant Minister for the same Department, on the 17th instant.

His Excellency Nabeshima, Minister to the Court of Rome, and His Excellency Nagaoka, Minister to the Court of Holland, were on the same day decorated with the Japanese order of the 3rd class, and Mr. E. Chiomone, an Italian subject in the employment of the Printing Bureau of the Finance Department, and Mr. Van Doorn, the Dutch Engineer in the employment of the Engineering Bureau of the Home Department, with the Japanese order of the 4th class.

The system for accumulating a fund to provide against the evil results of famine and other disasters, debated in the recent Local Governors' Assembly, was officially notified by the Prime Minister on the 15th instant.

#### NAVAL AND MILITARY.

Port Admiral Hayashi visited the German man-of-war *Vinctu*, on the 11th instant.

A native paper states "the French Government has sent the insignia of the Legion of Honour of the second class, to Generals Yamagata and Saigo, as a recognition of the fact that it was entirely owing to their exertions and influence, that Japan adopted the French Military system, and that the army has made such progress, which is considered to reflect honour upon France, and also in return for the kind treatment of Colonel Munier and the other members of the French Military Mission, during their stay in Japan. Colonel Munier has petitioned his government advising that decorations be sent to many other officers in the Japanese army."

The number of horses employed in the Japanese army at present is 2,848 in regular use, and 406 in reserve. In the stables are kept 1,723 horses, with 246 in reserve.

When the Military Code, which is now in course of preparation is put in force, Military Courts are to be established in each of the garrisons, and the Imperial Guard. A Court of Appeal will be instituted in Tokio.

Lieutenant General Shijo, the new Commander of the Sendai garrison, arrived at his post on the 7th instant, and was received by the officers at the post town of Masuda. A battalion of infantry, and a squadron of cavalry, proceeded as far as the town of Cho-machi to form an escort, and on the arrival of the General at the garrison, salutes were fired, and a review was held the following day on the Miyagi plains.

A telegram has been received in Tokio stating that the *Taukuba Kan* arrived safely at Vancouver Island, at 9.40 p.m., on the 9th instant.

Port Admiral Hayashi visited the British man-of-war *Iron Duke*, on the 14th instant.

Their Excellencies Generals Saigo and Yamagata, have been ordered to the post town of Kamoyama, to arrange for the sham fight between the Nagoya and Hiroshima garrison troops.

The *Hochi Shimbu* states that "His Imperial Highness the young Prince Arisugawa, who belongs to the English iron-clad *Iron Duke*, has lauded to visit his home on leave of absence for ten days, therefore he has to return on board his ship about the 21st or 22nd instant. The *Iron Duke* will sail for the

north in the beginning of next month. We hear that His Imperial Highness has passed the examination for and been appointed a midshipman."

In order to take part in the sham fight to be held shortly at the post town of Kaneyama, in the presence of His Majesty the Emperor, the following troops are to be detailed from the Osaka garrison:—the commanding officers and their servants in number 220 with 89 horses, 1,454 men of the 10th brigade of infantry with 8 horses, 225 artillery with 85 horses, a detachment of 81 sappers with 8 horses, and 1,609 men of the 9th brigade of infantry with 8 horses. The sham fight will last for two days.

#### INDUSTRIES, TRADE AND FINANCE.

The Savings' Bank at Yoro-cho, Nihon-bashi, Tokio, is to be opened on the 21st instant.

The breeding of horses and cattle at the Shimosa Farm is proving very successful. The farming operations have also been satisfactory in their results, and consequently the ground is to be extended.

The present wheat crop is very plentiful, but owing to the bad harvest of last year, and also to the high price of rice at present ruling, wheat will cost about six yen, when placed on the market.

We read in a native journal that "it was recently announced that some Chinese residents in Kobe had opened a Mexican dollar exchange office, but the Kencho authorities at once interfered and had a conference with the Chinese Consul on the subject."

The President of the Sakai Chamber of Commerce, Mr. Takayama, having lately been appointed the *Kacho* (chief local officer) and some of the other members secretaries, while many other members have withdrawn from the Chamber, it is now to be dissolved.

The breeding of silkworms in the Awoyama Palace, and also in the Botanical Gardens at Naito Shinjiku, has proved very successful this year.

The tinned fish and various other articles that are to be shown at the Melbourne Exhibition were despatched by the mail steamer which left on the 17th instant. Mr. Tokuda, a member of the Japanese commission, was on board.

A native paper says that "the Loochoo currency, which in form is like the Japanese *tempu*, only darker in colour and heavier in weight, with the words 'Loochoo Currency' on one side, and on the other the value, has been brought in large quantities from Okinawa k-u. It is rumoured that it will be recoined into Japanese copper coin, but the report does not seem trustworthy."

#### MISCELLANEOUS.

Their Imperial Highnesses Prince Arisugawa, and Prince Kitashirakawa, have each subscribed the sum of 100 yen for the relief of the sufferers by the recent fire at Kojimachi.

The *Mainichi Shimbun* has now contradicted the statement in a previous issue of that journal, that a riot had taken place in the prefecture of Fukuoka.

A new aqueduct is to be built in Anabu, Tokio, at an estimated cost of 30,000 yen.

A native journal states that "H.M.S. *Pegasus* arrived at Fusan, Corea about 5 a.m. on the 28th ultimo, being in addition to the British vessel previously reported. The Japanese Consul Mr. Kondo visited the *Pegasus* at 1 p.m. on the date of her arrival, and had some conversation with the Commander and then returned to his consulate. The Commander of the vessel made a return visit to the consulate almost at once and inspected the Japanese settlement. On the same evening the Japanese Consul was entertained on board, and on the following day the Commander and a party of officers landed and called at the consulate. They then went in the neighborhood of Soriu for the purpose of visiting Fusan, but the Japanese police officers advised the party not to go any further. It is reported that the Commander wanted to inspect the houses of the Korean inhabitants, but the Japanese Consul advised him not to do so. When the officers landed on the afternoon of the 28th ultimo, on the island of Zekki, they gave some silver money and liquor to the islanders, who were greatly pleased with the present, therefore, the officers thought the same would be the case with the rest of the Koreans; however, they

carried pistols to defend themselves in case of a sudden attack, and started for Fusan. When they reached Tokinokifu they found that the Koreans had taken great precautions since the arrival of the former English man-of-war there, and had a number of men ready to kill the English, when they came. The Japanese Consul, who was well aware of the facts, instructed the police to prevent the foreign visitors going any further. On the following day, the 30th ultimo, about twenty marines were landed, but they returned on board in safety, and the *Pegasus* left the Korean coast on the 31st. During her stay at Fusan, the Korean Governor prohibited his people from visiting the Japanese settlement, thus trade was brought almost to a standstill, and both the Japanese and Koreans were very much troubled."

There were cholera cases at Horikaye-mura, Yamagata Ken, on the 11th instant, and at Onomichi, Hiroshima Ken, on the 10th instant, and at Takemachi-mura, Nagasaki Ken. The last named has already had a fatal termination, but the others are still under treatment.

The *Nichi Nichi Shimbun* says that "the *Akitasu Maru* accompanied by the *Amaki Kan* arrived at Gensan, Corea, on the 20th ultimo. The Korean officers who were awaiting her arrival, received Consul-General Maida, and accompanied him to Gensan on the 21st ultimo, where he had an interview with the Governor of Tokugenu. Mr. Maida had several consultations about various matters concerning the opening of the new port and the utmost good feeling prevailed. About twenty houses were hired from the Koreans by the Japanese for temporary residences, and everything is going on smoothly between the new arrivals and the natives. A small building was completed on the 26th ultimo, and the Consulate General was established there for the present. The Governor has informed the Japanese Consul that as the new port is a place where a great many people assemble from different localities, there may be some evil-disposed men among them, and he asked the Japanese to take good care of themselves. The Governor also said that he would keep a strict watch for a time, and accordingly the Korean troops are at present guarding the settlement. The Koreans of the new port, both the officials and the people, are far more hospitable and gentle than those of Fusan, and no fighting or quarrelling has taken place between them and the Japanese. No property belonging to Japanese has as yet been stolen, but this may, perhaps, be because the people of the new port are still simple, and free from the bad habits prevailing in other open ports. The work of building a landing place has not been commenced, but preparations are now being made."

A native journal mentions that through some unexplained cause the engine of the train which left Shinbashi on Sunday last, at noon, was unable to take the train past the Omori station. A telegram was sent to Shinbashi and another locomotive was at once despatched from there. The train was brought on to Yokohama after a delay of about thirty minutes.

The *Hochi Shimbun* writes as follows:—"We hear from a person who has recently returned from Hakodate, that the circulation of money in the town of Hakodate is very small at the present time: consequently the price of all commodities has risen. This is especially the case with respect to timber, and a number of the houses burnt down last year have not been rebuilt. The *Hiogo Maru* was to have left Hakodate on the 8th instant, but, owing to the unfavourable state of the weather, her departure was postponed until the afternoon of the 9th instant. During the passage to Yokohama she experienced very stormy weather. One of the passengers died from sea-sickness during the voyage."

A native paper states that the French *Chargé d'Affaires* has recently started for the provinces of Kazusa and Boohiu, under the prefecture of Chiba, to visit different localities, and is expected to return to Tokio about the 20th instant.

A fire occurred at Yokoyama-cho, Tokio, at 10.30 p.m. on the 15th instant. As a strong southerly wind was blowing, the flames soon spread to Bakuro-cho, and destroyed thirty-nine houses, and one godown, and damaged one house before they were extinguished about 11 p.m.

A native paper states that the total number of houses destroy-

ed by the fire on the 16th instant, at Matsukage-cho, was ninety-three.

A fire took place at Moto-machi, Yokosuka, at 11.40 p.m. on the 15th instant, which destroyed one hundred and fifty-seven houses, including two godowns, and the branch telegraph office.

The first numbers of the *Maishin Shimpō*, a weekly paper published at Yamashiro-cho, Tokio, and of the *Kobe Shokin Shinshi*, published in the office of the Kobe Chamber of Commerce, have made their appearance.

The native papers mention that the number of deaths which occurred in Tokio in the month of January last, was 1,427; 784 males, and 643 females.

The coaches belonging to the Ko-un-cha have been frequently attacked by armed robbers at Kumagaya, and in many cases the coachmen and passengers have been wounded. On the 14th instant, the Post Office authorities instructed the managers of the company, to make the drivers of the coaches running upon the Nakasendo road, carry pistols for the protection of the mails, and four revolvers with the necessary ammunition were accordingly handed over to the company.

### THE JAPANESE PRESS.

#### THE CHANGE IN THE FOREIGN RELATIONS OF COREA.

(Translated from the *Mainichi Shimbun*.)

IT is a very well known fact that the Government of Corea has from the earliest times adopted the policy of closing that country from the rest of the world. When our Government some years ago sent Ambassadors to Corea, they told the local authorities that it was very necessary for Corea to have intercourse with neighbouring countries, and that much benefit would result from friendly relations with foreign states. Notwithstanding this advice, the members of the Korean Government have for the most part still adhered to the old

policy of closing their country, and thus the negotiations for opening the state were not easily successfully concluded. However, our Ambassadors acted very kindly towards the Korean functionaries, and, it being apparent that we had much better arms than our neighbours, the two circumstances resulted in the abandonment of the old policy of seclusion which had existed in Corea for thousands of years, and the admission of Japanese for trading purposes. It would appear, therefore, that intercourse between the two countries did not arise from the hearty goodwill of the Korean Government, but rather that they were coerced into making a commercial treaty with us. Indeed, the only thing that our Government has to be proud of in the matter as regards the treaty is, that we did not resort to force from first to last in dealing with Corea, but induced compliance with our demands by peaceful conferences and the force of reason and common-sense arguments. When we reflect how foreign countries, despatching fleets about the Pacific and the Atlantic coasts, have opened up trade and commerce with other countries, the difference between their action and that of the Japanese Government in the case of the obstinate Koreans is very remarkable; they resort to violence to accomplish their ends; we appeal to argument and friendly negotiation. As regards the action of Holland towards the inhabitants of the different islands in the Indian Ocean, and the conduct of the British Government towards those of the islands in both the Southern and Indian Ocean, we observe that they have always threatened them, and when the British or Dutch found their proposals rejected by the islanders, the former always depended upon their superiority of strength, and seized the land and other property of the natives, and even the inhabitants themselves. Thus these invaders have not always treated the conquered as on the same footing with themselves, and cases of this kind have been very frequent. Under these circumstances, the foreign nations who proudly call themselves the civilized people of the earth, only repeat the maxim, which says, "all people ought to have equal rights." For our part we have never heard of any of them, these foreigners, carrying this maxim into practice, whereas, on the other hand, although there were very few indeed in our country who, ten years since, knew that all people ought to be put on the same footing, yet we have treated the Koreans as on an equality with ourselves, and did not make any use of our superior arms, equipment and knowledge of warfare, or follow the baneful example of foreign countries. Our conduct was therefore such as should make the foreign Governments and people who arrogantly call themselves "the enlightened," feel ashamed when they reflect upon their proceedings in similar cases and our action towards Corea. This matter, which redounds so greatly to the credit of Japan, was accomplished during the present reign.

We have already published a report from our correspondent in Corea, mentioning that a certain American man-of-war visited the port of Fusan, and that the commander communicated to the Korean authorities, through our Consul Mr. Kondo, the desire of the Government to open up trade with their country; and our next letter informed us that a Russian man-of-war arrived on the coast of Kan-kin-dai, Corea, sometime in the month of last April, for the purpose of compelling the Korean Government to enter into friendly intercourse with Russia, but that the Korean authorities refused to comply with the desire of Russia, stating that their doing so was forbidden by the laws of their country. Upon this the Russians made a display of their strength, broke down the gates of the town, and forcing their way into it, upbraided the Korean Governor very severely for refusing to have intercourse with a neighboring country. We have recently heard also that an American man-of-war, the *Ticonderoga*, has sailed to Corea, by order of the American Government. Now both Russia and the United States of America have not hitherto pressed upon the Korean Government the question of opening the trade, but we find both countries are now suddenly commencing to take urgent measures to force Corea from seclusion. The reason for this sudden action may be, perhaps, that the two Governments referred to envy the daily increasing trade between Japan and Corea, and have come to the conclusion that it would be far better for them to enter into a treaty of commerce with Corea, and obtain a share of the trade, than to allow the Japanese Government and people alone to reap the benefit of intercourse with Corea. It is true that commerce is of vast importance to the human race, as it affords the means by which one country

exchanges its products for those of another. Therefore, if the Korean Government really wishes to extend its trade, and not only Russia and the United States, but also all the mercantile countries in the world freely conclude treaties of commerce and enter into peaceful intercourse with Korea, neither the Government nor people of Japan will have anything to be with it. But if Russia and the United States adopt warlike measures and resort to force of arms, in case their negotiation be not at once successful, the misfortunes which will follow do not concern the Korean people alone, for we shall unfortunately find our daily increasing Korean trade brought to a disastrous condition. This being the case our countrymen ought not to overlook the movements of the Russian and American men-of-war in Korean waters, and in order to shew the importance of our commercial interests with Korea, we have prepared the following tables.

Value of exports from Japan and Korea respectively from 1873-1875, calculated at the selling price of the goods.

From Japan to Korea.	From Korea to Japan.
1873.....Yen 59,664	52,882
1874....." 57,522	55,935
1875....." 68,930	59,787

Value of exports from 1876-1879 calculated at the original cost of the goods.

From Japan to Korea.	From Korea to Japan.
1876.....Yen 81,374	82,572
1877....." 299,249	166,823
1878....." 244,584	205,280
1879....." 566,956	677,661

Number of vessels arrived at and sailed from Fusan.

	Steamers.	Sailing Vessels.	Ships.
1875 .....	20	—	100
1876 .....	No record kept.		
1877 .....	6	—	318
1878 .....	13	—	236
1879 .....	30	15	644

Japanese Residents in Fusan.

1877.	1878.	1879.
304	566	450

From these tables it will be seen that commerce has vastly increased; and as regards exports and imports, shipping and population, our trade with Korea is in a flourishing condition. We shall now treat of the consequences to that trade which would result from a change in the present state of the foreign relations of Korea.

As can be seen from the above tables, our Korean trade—export and import—in 1873 amounted to only 111,000 yen, but after four years elapsed, it reached, in 1878, about 863,800 yen, and in 1879 about 466,000 yen, and in the following year, 1879, the value of 1,243,800 yen. Again, the number of ships which arrived and were despatched in 1875, including both mail steamers and mercantile vessels, amounted only to 120, but in 1878 the number reached 300, and in 1879 it came to about 700. Thus we see that the Korean trade is steadily increasing year after year both in exports and imports, and, if it does not suffer from some untoward circumstance, we may certainly expect that, within a few years, the eight states in Korea will all become good customers of Japan. However, Russia, a Government that adopts force as its policy, and the seizure of the territory of other nations as its guide in diplomacy, has now commenced to force the Korean Government to subserve its desires. If the Koreans conclude a treaty of intercourse with Russia in a peaceful manner, our trade with the country will not be very much disturbed, but it is not a matter of to-day that the Korean authorities have adopted the policy of seclusion, and that the Korean people have followed the Oriental rule of looking on foreigners as barbarians. Therefore it is quite uncertain whether or not the Korean Government will reject the overtures of Russia, and appeal to arms, if necessary, to decide the matter. On the other hand, Russia's policy being to absorb the territory of other countries, if a dispute arises between her and the Korean Government, Russia will at once pour her forces through the two states of Kankin and Kogen, thus occupying the country, and attacking Kin-ki-dai in the rear. Again the policy of the United States of America is quite different from the warlike conduct of the various European countries, but then, if the American Government are rudely treated by the Koreans, we cannot see whether they will not make war upon Korea,

under the pretext of their improper behavior and then conclude a peace with them. If such an unwelcome occurrence should unfortunately take place, the eight states of Korea would be turned into a bloody warfield, and the Koreans would inevitably suffer great miseries, being deprived of their agricultural and commercial callings. How then could Korea, under such circumstances, carry on trade with our residents in their open ports, and barter their gold dust and ginseng? Therefore it is evident that if Korea will not submit to foreign intercourse peacefully, but refers the matter to the arbitrament of the sword, our residents there will share in the inevitable miseries which such a course will entail upon the Koreans, and the now daily increasing and flourishing trade will dwindle away to nothing. However, as regards the present state of Korea, the territory is not in size more than about one-third of Japan, and therefore its population is probably not greater than one-third of ours. Moreover, the people of Korea are very obstinate, and know nothing about the progress of civilization, therefore the question arises, would they, when they see the powerful forces of Russia or America, at once throw down their arms and surrender? We fear that even although Korea, acknowledging her weakness and the overwhelming strength of other countries, should enter into negotiation with them in a peaceful manner, our traders in Korea will not be allowed to sleep soundly in the port of Fusan. Now as regards the interests of foreign intercourse, there are two important things, viz:—"The influence of the sword" and "moral suasion." Violence is spoken of with contempt by civilized people, but human nature being weak and helpless, we cannot abolish the use of such bad, shameful, and evil weapons, and those who are possessed of strong military forces always gain victories in diplomatic conferences, while those who have only intellectual power are forced by necessity to trim their sails to avoid complications and disaster. When the Japanese are compared with the Koreans, the former are possessed of both attributes in some greater degree than the latter, but when we are compared with Russia and the United States of America, we are far inferior to them. Therefore, as long as the Korean Government does not conclude treaties of commerce with other countries, we can secure whatever advantage there may be in the Korean trade, simply because of our superiority over the Koreans, but if Korea ever opens a way for unrestricted foreign trade, and accedes to the wishes of the United States and Russia, we cannot tell whether the present state of the trade will not become changed, and our present commercial interests fall into the hands of others. According to the information that we have lately received from our correspondent in Korea, it is said, of the goods imported there from Japan, that one-third are Japanese produce, while two-thirds are foreign manufactures. Thus we are simply acting in Korea as agents for the sale of the manufactures of foreign countries, and at the same time the Koreans are at a disadvantage, because they cannot purchase European articles unless through us. However, if the Korean Government enters into treaties of commerce with the United States and Russia, this disadvantage will be avoided, and the Koreans will be enabled to purchase their cannon, gunpowder and cotton, direct from the European merchants without the intervention of Japanese traders. In that case the present amount of imports from our country will hereafter be reduced to one-third, and the other two-thirds will be diverted to the benefit of foreign traders. It will thus be noticed that a change in the present condition of the foreign relations of Korea, implies a change in our trade with that country. Therefore, our traders ought to take measures to provide against all emergencies arising out of any such altered circumstances. From an old history, we learn that in the good old times the Portuguese Government, acting under authority granted by the Pope of Rome, was alone interested in the trade with the East Indies, but the Dutch, having become jealous of the Portuguese alone deriving the benefit from that trade, embarked in it themselves, and for a time all the islands lying in the Indian Ocean were called the treasury of Holland. Then England yearned after a share in the wealth reaped by Holland, commenced commercial intercourse with India by force of arms, and took possession of the treasury which previously belonged to Holland. Judging from the movements of both the United States and Russia towards Korea at the present day, we are compelled to remember the changes that occurred in India in times gone by, which shew that this is not the time for our traders who are engaged in the Korean trade to be sleeping soundly.

## APPOINTMENT OF DIPLOMATIC AGENTS.

(Translated from the *Kinji Hiron.*)

IT would be impracticable for any one, when sent abroad as ambassador, representing his sovereign, to carry out the object of his mission without contravening the order which he has received, unless he is possessed of great knowledge and experience. Reading one of the recent issues of the *Nichi Nichi Shimbu*, we find the following paragraph, which surprises us very much:—"It is probable that Ministers to foreign Courts will hereafter be chosen from among military officers above the rank of Lieutenant-General, and naval officers above the rank of Rear-Admiral." We admit that officers above the ranks mentioned in the respective services are all of very high position, and that their offices are very respectable. Further, they may bear the brilliant insignia of orders of merit, but they are, for the most part, in want of practical knowledge and experience, and are only notable for their fearless disposition. The Generals are only fit for service in war, fighting bravely in command of their forces, and advancing fearlessly in face of a shower of bullets and the smoke of cannon, while Admirals are in their place in naval warfare, leading their fleets. Military and naval leaders are thus indispensable in their respective spheres of service; but, as they have no experience in diplomatic affairs, are not fit to be ministers accredited to foreign Courts, where they have to discharge their functions solely in accordance with the will of their sovereign. However, Ministers sent to Foreign courts from our Government have hitherto been chosen among inexperienced students who had been educated abroad, or among incapable and useless nobles. Hence when they were sent abroad, they proved themselves neither active nor powerful enough to maintain the rights of their own country, and thus in several instances we find that our country was despised by external powers. Moreover at the present day, when we are about to revise the treaties with the different nations in Europe and America, our ministers at Foreign courts will, of course, be unable to maintain the rights of our country, unless they are very active and influential. It cannot be doubtful that the naval and military officers are, when compared with inexperienced students and incompetent nobles, active and strong minded, though they lack knowledge and experience. Does the Government then mean to replace students and the nobles by naval and military officers, notwithstanding their ignorance? We cannot ascertain the profound views of the Government, but if it really considers that it is possible to promote our sovereign rights before the cunning people of Europe and America, by sending out ignorant and inexperienced naval and military officers as Ministers, and depending upon their activity and bravery, such a proposal may indeed be as hopeless as to try to catch fish in a forest, and perhaps Mencius, who cites this example of "fishing in a forest" as being a hopeless undertaking, and who was ignorant of the civilization of the nineteenth century, would also laugh at such a proposal.

## LAW REPORTS.

## IN THE U. S. CONSULAR GENERAL COURT.

Before General T. B. VAN BUREN, Consul-General, Judge.

A. S. FOWES and E. R. SMITH, Assessors.

Monday, June 14th, 1880.

SIDNEY M. SMITH, by his attorney and agent F. C. SPOONER, plaintiff, against ISAAC BUSH and AUGUST LANGFELDT, defendants.

Mr. Hill appeared for the plaintiff, and Mr. Litchfield for the defendant, I. Bush; Mr. Langfeldt appeared in person.

Mr. Hill said as it was the first case of the kind he had been engaged in for a long while, he would ask as to whether any interlocutory questions would be settled by the Judge, or whether he would consult with the assessors in relation to them.

His Honour said the law was not clear on the subject, but that it had always been the custom to have a consultation with regard to all questions; and though, perhaps, it was the Judge who practically decided them, yet the fact of the assent or dissent of the assessors was always noted.

Mr. Hill would not make any further remarks, as it was most probable that the points which would be raised in this case would be decided by His Honour, but the counsel might wish the assessors to be consulted on some points.

His Honour then read the petition and the separate answers of the defendants.

The above named plaintiff, complaining of the defendants, shows this Honorable Court as follows:

First:—That heretofore, and on or about the 3rd day of May last past, the defendant Isaac Bush was indebted to divers persons whose names and the amounts of said indebtedness are shown more specifically in the schedule attached to and made a part of this petition, and marked A., such indebtedness having been incurred by the said defendant Isaac Bush for goods and merchandise sold and delivered to him at sundry times during the two years last past, and amounting in the aggregate to the sum of \$22,747.00 in currency of the U.S., or about, say Mexican dollars 24,460.00.

Second:—That heretofore, and before the commencement of this action, each and all of the debts mentioned in paragraph 1 of this petition and in said schedule A were assigned, sold, and transferred to the plaintiff, who is now the owner and holder thereof, and that each and all of said debts, in the aggregate amounting to the said sum of about Mex. \$24,460, now remains wholly due and unpaid.

Third:—That as the plaintiff is informed and believes the said defendant Isaac Bush is also indebted to other persons in a considerable amount, but to what persons or to what amount the plaintiff is unable to say or state.

Fourth:—That as the plaintiff is informed and verily believes a very large part of the goods and merchandise sold and delivered to the defendant Isaac Bush as aforesaid, was heretofore and at sundry times by him fraudulently disposed of, concealed, and sold, and that he, the said, defendant, Isaac Bush, has wrongfully, unlawfully, and fraudulently concealed and retained and appropriated to his own use the proceeds of such goods and merchandise.

Fifth:—That on or about the 27th day of March last the said defendant, Isaac Bush, executed an assignment purporting to be made for the benefit of his creditors, whereby he assigned the goods and merchandise, accounts and credits then in his possession to the defendant, August Langfeldt; but the plaintiff avers that as he is informed and believes the said assignment was fraudulent, and that the defendant Isaac Bush wrongfully, and fraudulently concealed and secreted and kept from his creditors and in his own possession, and under his own control a large amount of money, the proceeds of the sale of the goods and merchandise made as hereinbefore mentioned, and wrongfully and fraudulently failed and neglected to deliver or pay over the same to his assignee, the said defendant, August Langfeldt.

Sixth:—That the said defendant, August Langfeldt, on or about the said 27th March last did, under the assignment made by the defendant Isaac Bush as aforesaid, receive and take possession of a certain quantity of merchandise accounts, debts, and effects until then possessed by the defendant Isaac Bush, and has since the date last aforesaid disposed of some portion thereof, and collected some part of such debts, and disbursed and paid out moneys from the proceeds, and has still in his possession a certain portion of such goods and merchandise and certain moneys the proceeds thereof as aforesaid.

And the plaintiff prays the Court:

1st.—For judgment against the defendant, Isaac Bush, for the sum of \$24,460 named in paragraphs 1st and 2nd hereof, and for interest thereon from the date on which same became due.

2nd.—That the said defendant Isaac Bush be arrested and examined touching the said indebtedness and his disposition of the proceeds of the goods and merchandise sold and disposed of, and that he be required and directed to pay over and deliver such proceeds into the Court, to await the decision of this action and to satisfy the judgment herein, and that he be imprisoned until the judgment be satisfied.

3rd.—That all the property of the defendant, Isaac Bush, be attached and seized as security for the satisfaction of such judgment as the plaintiff may recover herein.

Fourth.—That the defendant August Langfeldt be required to render an account to the Court of the goods and merchandise, credits and effects of the defendant Isaac Bush

taken possession of by him, and of the amount of money received from any sale or sales of such goods and merchandise, and of the disposition made of the proceeds, and he required and directed to pay and turn over the whole of such goods and merchandise and the proceeds therefrom into the Court, to await the decision of this action and to satisfy the judgment herein.

Fifth.—For such other or further relief as justice and equity may require. (To this was appended the list of debts.)

Isaac Bush, one of the defendants in the above entitled cause, per answer to the petition of the complainant filed therein, respectfully shows to the court that he admits his indebtedness to the parties named, and the amounts set forth in the schedule attached to said petition, but that he has no knowledge that complainant is the owner and holder of all said claims and he therefore denies such ownership.

Defendant also admits that he has made an assignment to August Langfeldt, the co-defendant, of all his property for the benefit of his creditors, but he denies that the same was fraudulent, or that he has concealed or secreted any property as set forth in said petition.

Defendant denies each and every other allegation in said petition.

In answer to the petition of the plaintiff, the defendant August Langfeldt respectfully avers,—

1.—That of the allegations made in the 1st clause of the petition he has no knowledge, and, supposing them to be true, they do not affect him, the said August Langfeldt.

2.—That the defendant has no knowledge of the fact that the plaintiff is the sole owner of the debts mentioned in schedule A; but verily believes that the allegation is not true in fact.

Third.—That the defendant makes the same answer to the third clause of the petition as he has made to the first.

Fourth.—That he makes the same answer to the fourth clause of the petition as the last.

Fifth.—The defendant admits so much of the fifth clause of the petition that states that Isaac Bush executed an assignment for the benefit of his, the said Isaac Bush's creditors, but denies any fraud in said assignment as far as he, August Langfeldt, is concerned.

Sixth.—The defendant August Langfeldt admits the allegation contained in the 6th clause of the petition.

Seventh.—And the defendant August Langfeldt further avers that he when he was acquainted with the fact that F. C. Spooner, the attorney for the plaintiff, was interested in the estate of Isaac Bush, he offered to act in concert with the said F. C. Spooner under the direction of this honorable Court, for the benefit of all the creditors.

Therefore the defendant prays that this suit, as far as he, the said August Langfeldt, is concerned, be dismissed with costs, and that this Court grant him such other and further relief as justice and equity may require.

Mr. Hill opened the case with a few remarks. The issue was plain, though the answers, not being drawn up by a professional man, were very inartificially done; but, letting that pass, the chief allegation was that there was fraud on the part of Bush. This he denies, and is what is to be settled by the Court. The assessors were business men, and would know whether there was palpable fraud on the part of the defendant Bush. Fraud is a tort, and is a different thing from a contract. Fraud is a thing done in secret, and there naturally would be no direct evidence available, but the plaintiff expected to be able to show to the satisfaction of the Court that there had been fraud. The speaker never had during his practice been able to bring direct evidence in a case of this nature, and did not expect to be able to do it on this occasion. He expected to be met with obstacles at every turn, and that he would have to beat around the bush in order to get out the evidence he wanted. Mr. Bush, in a letter which would be produced, avowed his indebtedness to the amount of about \$26,000, and wished to pay twenty per cent. of the amount and leave the rest. He commenced business with a large quantity of goods and ran about two years, and it is not probable that in a small store in this place he lost money at the rate of about \$1,000 a month, as he has claimed he did.

To an enquiry by Mr. Hill about the book and papers, it was stated that they were all in court.

Isaac Bush, sworn to:—I am one of the defendants in this case.

Mr. Litchfield said that before the case was proceeded with any further he would call the attention of the Court to the second section of the plaint. (Read.) That clause was denied, and the speaker would ask if counsel on the other side had any proof that plaintiff was the assignee of the accounts as alleged.

Mr. Hill objected to being dictated to as to the way in which he was to conduct his case.

His Honour said that Mr. Litchfield was in the right. That was the time to prove the transfer of the debts.

Mr. Hill could prove it, but wanted to do it his own way. He had documents to prove it.

After a little more argument, Mr. Hill produced and handed in the power of attorney from Sidney M. Smith to F. C. Spooner, with a schedule of the debts included in it and duly sworn to and verified. The recital in it shows the acknowledgment and the transfer of the debts in the schedule.

Mr. Litchfield said the matter was very simple. The allegation that Smith is the person he represents himself to be is denied, and the first thing to be done on the other side was to prove it. Mr. Spooner had better be called and examined. The last clause of the power of attorney is probably the one the learned counsel relies on to prove this fact. It alleges that the debts were assigned but is no proof.

Mr. Hill said he could prove, by documents and by the evidence of Mr. Spooner and Mr. Bush, that plaintiff was partner in one of the firms on the schedule and as such a creditor to the amount of over \$1,000. On that ground he had a standing in Court.

His Honour said the petition would have to be amended; and held that the evidence so far put in was not sufficient to prove the ownership of Smith in the amounts sued for.

Mr. Hill said he was much hampered by the decision of the Court, and would have to ask for an adjournment till the proper proof had been sent for from San Francisco. He would make an application in Chambers that Mr. Bush be compelled to remain in Yokohama.

His Honour would suggest that the matter be considered by the other side as to whether it would not be better to let the case proceed as far as it might, with the understanding that no judgment be rendered or steps leading to one taken till the necessary evidence on this point was produced. There was no moral doubt from the appearance of the power of attorney, that the evidence would be forthcoming, and that before that document was given by plaintiff he must have received power to execute it. It was hardly worth while delaying the taking of the other evidence during the three months that it would take to obtain an answer from San Francisco.

Mr. Litchfield said he came into the case at the last minute, and did not know if Smith was duly authorized or not. The case bore very heavily on his client, and he did not feel at liberty to relax any vigilance or omit any exception which the law gave him the power to take. But on viewing the case as presented by the remarks of His Honour, and also that defendant might clear his character, which is at fault through the plaintiff's neglect, and through that alone, he would consent to allow the case to proceed under the understanding suggested by His Honour.

Mr. Bush to Mr. Hill:—Mr. Litchfield was engaged by me after the commencement of the case.

Mr. Hill:—Has Mr. Litchfield been recommended to you?

Mr. Litchfield objected to the question as irrelevant, and objectionable.

His Honour supported the objection, holding that the question was objectionable on its face, and it was withdrawn.

Witness to Mr. Hill:—I entered into business in Yokohama the last time at the middle or end of September, 1878. I came from San Francisco, bringing goods and merchandise. I do not remember the value of the goods—my books will show. On reference to my journal I find the amounts entered on page 1. (Marked Exhibit A.) My son kept the books. (Page 4 of ledger shown witness and, he reading from entries on it:) The value of the goods brought with me were cash \$94.50; goods, \$2,214.22; freight, \$92.42; goods \$958.

Mr. Hill:—Here, stop! Can you, after consulting

with your nephew and examining the books, tell the amount of goods you brought here with you?

Witness:—Yes, I can.

The Court ordered it to be done at recess.

Witness:—My son was not with me when I came. My nephew came over with me. Of those goods part were bought with cash, and part on credit, I do not know if my books will show the correct statement of my accounts with San Francisco. I left the books to my son, and do not understand them. I told him to put all down that I sold and did. Since my son's arrival he kept the books. He arrived at the end of February or beginning of March, 1879.

His Honour here noticing the witness's nephew (Lewis Siedenberg) making signs to witness, told him that any attempt to interfere with the evidence of a witness would be treated as contempt of Court and punished very severely.

Witness:—I do not know enough of book-keeping to know if the books are correctly kept or not. My son has not a thorough knowledge of book-keeping. No one specially had charge of the money. When received it would be placed in the drawer, and when it got to a certain amount it would be taken out and put in the bank; sometimes by me sometimes by my son. I had a banking account with the Hongkong and Shanghai Bank. I do not know if I made most deposits, or my son. I always drew money by cheque. During the next few months after my arrival here I received goods from San Francisco, and remitted money there by drafts. I think I can make a statement of all merchandise received by me from San Francisco from September, 1878, to April 1st, 1879.

The Court here adjourned till 2 p. m., and orders were given to the defendant Bush to make up abstracts of the various points on which he had been interrogated during the morning.

The Court re-opened at 2 p. m., according to adjournment.

The examination of Mr. Bush was continued by Mr. Hill:—I have looked at the books with my nephew. The total value of goods bought originally was \$3,756.08. The amount of cash paid on the goods was \$1,082.61; the amount of credit was \$1,447.36. The balance consisted of merchandise, an old stock of jewellery which I had remaining over from my former business, \$1,226.11. The cash thus stated includes all the expenses on the goods in San Francisco. The balance of jewellery was my own property and had been fully paid for by me. I had at that time some real estate—there was a mortgage on it of \$5,000. My books will show what cash I had on hand at the time. (After reference.) It was \$2,663.17 on hand, and at my order when I left San Francisco. Out of that amount I paid freight. The brokerage, drayage and freight amounted to \$267, and there was also the duty paid here of \$94.50. (Witness's nephew assisted him at the books to find these amounts, which were all shown plaintiff's counsel). Those amounts are all that there is to come out of the \$1,082 in order to find the actual cash paid for the purchase of the goods. I have not prepared an abstract of the goods received from San Francisco since I arrived here, not having had time to do so during recess. It was not customary for me to take an account of stock—I never did it. When I referred to the goods I could see how I stood. By that I mean I could see how much I owed. I never had a balance sheet drawn. I could tell my indebtedness and my losses.

Mr. Hill handed witness lithogram copy of a letter, and said, as he intended to put it in as evidence, he would read it. (Marked exhibit B.)

CUTTING PACKING Co.,

San Francisco.

DEAR SIR,—Owing to unfortunate speculations in Japanese Currency, I find myself at present unable to meet the bills of my creditors.

For the last 30 days bills have been sent here for collection and large quantities of goods taken from me by the parties who held the respective power of attorneys which has deprived me of all chance to work myself out of debt again, and pay my bills in full, but as I would like my creditors to share equally, I have, after consultation with the U. S. Consul-General, transferred my whole stock, outstandings, &c., to Mr. Aug. Langfeldt of this place, for the benefit of all my creditors, who will act in accordance with your orders.

By winding up my business gradually the expense will reduce my present assets and the loss will be heavier for my creditors, therefore I would make the proposition to pay my creditors, 20 % 30 days after receipt of answer, in accordance with the amounts that would be realized from my present assets with undoubted security, if they would give me a full discharge of all my liabilities.

Should the suit now pending against me, regarding the validity of a mortgage for \$5,000 be decided in my favor, I would make an additional payment of 15 % 60 days after receiving advice of same, hoping for a favorable answer by return mail.

I remain,

Respy. yours,

I. BUSH.

Witness.—The letter is dated April 1st, 1880. I first became aware of my insolvency about the middle of March. Bills were presented to me from the beginning of March. I do not remember how I stood up to that time. Up to the middle of March I did not consider myself able to pay my debts if I was pressed and pushed. The amounts presented during the beginning of March which cramped me were, I should say, about \$4,000. I do not remember them all. They were presented during the beginning of March. The most part of them were settled. I think more than half were settled. They were settled by payment in goods and also in cash. I have receipts to show the amount of cash expended. (Receipts referred to.) The first was presented by Mr. Mendelsohn on the 4th March, on behalf of Michelson, Brown & Co. of San Francisco, for \$947.48,—it was paid in full in merchandise. The second was also presented by Mr. Mendelsohn, on the 25th March, on behalf of J. Landsberger & Co., of San Francisco, for \$366.80,—this was also paid in full, in merchandise. The next was presented by Messrs. Monrilyan, Heimann & Co., on the 9th March, on behalf of M. Ehrman & Co., of San Francisco, for \$900,—of this \$200 was paid in cash on account, and the balance of \$700 remains unpaid. The next was presented by Gen. Van Buren, on behalf of H. B. Hussey & Co., of San Francisco, for \$980,—of this amount three-fourths was paid in cash and the balance secured by deposit of merchandise; the latter has been since returned and the remainder paid in cash. The amount of that account was about \$980. Those were the only accounts I settled. There were other accounts presented but I do not remember the amounts nor who they were from. Mr. Degron, Mr. Kirkwood and Mr. Paul Heinemann presented three. They were presented during March and after. I do not remember whether these last three were presented in March or April. The amounts I have given in I paid out during March. The goods I turned over to Mendelsohn were estimated at their full value. It was the same with the other accounts paid in merchandise. Some of the accounts presented and paid were due. I cannot tell without referring to my books which were due and which not. (Court ordered witness to make a list.) I really do not know how I stood on the 1st March. I do not know when it was I first thought myself insolvent—it was between the 1st and middle of March. On the 1st February I could not tell how I stood, whether my assets were greater or less than my liabilities. I believe I was solvent to October or November, 1879. From then to the 1st March I do not remember having any serious impressions that I was insolvent. I think it was the presenting of these matured bills and otherwise that made me think I was insolvent. What made me insolvent was that I was dealing in *kinsatsu* during that time. I think that was the sole cause of my being insolvent,—at least that and the presentation of the bills. The presentation of the bills did not make me insolvent—it affected me as much as dealing in *kinsatsu*. On the 1st January, 1880, I could not tell how much I was worth. I took no account of stock and had no judgment whatsoever how I stood. I did not at different times take steps to find out how much I was worth. (Letter handed witness.) I think this is a copy of a letter I sent Lessynski. (On examination witness found the document was not signed and withdrew his last answer.) I have no copy of the letter I sent Lessynski. I did send him one and from seeing his name at the head of this thought it was the same. I think this is in the handwriting of my nephew, who is with me, in my employment. I never authorized such a letter as this. The date of the mail taking the letter announcing my bankruptcy was about the beginning of April. The aggregate of my losses in *kinsatsu* was \$10,000.

Yokohama, April 1st, 1880.

They were incurred from December, 1879, to March, 1880,—about three months. I had habitually speculated in *kinsatsu* previously in very small amounts. By small amounts I mean from \$500 to \$1,000. I would pay that out on the transactions. It may have been a little over \$1,000 that I lost. Previous to December, 1879, I may have lost about that amount. I may have handled between 300,000 and 400,000 *yen* during those three months. This was done through a Japanese broker named Takajiro. I gave him money and he brought me the reports. I gave him money sometimes twice a day. By that I mean I gave him money as a margin. I do not know where or how he did business. I dealt entirely with him. I have known him a year or so. All my transactions in *kinsatsu* were done through him. I first met him at different exchange broker's houses. I believe he was only a broker—buying and selling for other people. The last time I saw him was in March. I believe the address he gave was Otamachi Gochomo. I never went there. He came to my house. I opened a separate page in my books for the amounts I drew out to speculate in *kinsatsu*. I do not think that drawing out that money embarrassed me in my business—in paying my bills—not till the first bills were presented in March. The amount drawn out by me during that time did not interfere with my business. I made some remittances during that time. The broker took his orders from me. I only put up the margin, which was four per cent. I paid him sometimes twice a day, sometimes once a day, sometimes once a week. The time I dealt twice a day the *kinsatsu* were going up and down—they were not only going up. As my book shows the different amounts drawn and paid my broker in this *kinsatsu* business, and as the margin is four per cent., we can get at the amount of *kinsatsu* bought by multiplying that by 25. During those times I sometimes won and sometimes lost. The gains were not frequent. The amounts I gained in that way I used to purchase more *kinsatsu* with. I did not enter it anywhere. I could not state the amount I thus won and used over again; I think it was from 1,500 to 2,000 *yen*. (Witness referred to folio 1 of ledger.) This page contains a statement of all the amounts drawn out and used by me in the purchase of *kinsatsu*.

Mr. Hill requested that Mr. Rice, of the Consulate, be asked to make an abstract of this page showing all the entries—which abstract when made is to be marked Exhibit C.

Witness:—I believe that that page (Led. fol. 1) contains all my ledger entries on *kinsatsu* matters. I do not know for certain. I believe that that is a correct statement, and comprises all the amounts drawn out and used by me in *kinsatsu* speculations. I cannot say positively whether that is so or not. I am not a book-keeper, and do not know. I know those entries are correct. At the time I drew money I told my son to enter the amounts and looked occasionally afterwards at the entries, and I believe them to be correct. The answers as now read to me from the Judge's notes are correct.

Mr. Hill:—On looking at this first page of the ledger I find an entry on Dec. 28th, 1878, of 40—\$300. Then there is a hiatus till Dec., 1879. Yet you say you lost \$1,000 during that period. How is that?

Witness:—It may not have been entered by my son, or the entries may be somewhere else.

Mr. Hill:—Was there any circumstance which made you go to see if these entries on the first page of the ledger were properly made?

Witness:—I wanted to see if I gained or lost. If I bought \$10,000 worth and sold it for \$15,000 I should have gained \$5,000.

Mr. Hill:—How did you make that out from the books?

Witness:—I don't understand it myself. I had some *kinsatsu* receipts, but have destroyed them. They were receipts given me by the broker when I paid him money. I destroyed them at the beginning of March, when I was sold out as I could not keep up the margin. I destroyed them all at once—all I had. If I had destroyed any previously I should have remembered it, but I do not remember doing so. I kept no memorandum, or book or account of any kind, while I was dealing in *satsu*, except the receipts mentioned. My reason for destroying those receipts was that I did not want any one to know I was speculating in *satsu*, as that might injure my credit.

Mr. Hill:—You kept those receipts for a year without

any fear of its getting known. How, then, did you expect people to find this out at the beginning of March? How, if you had these receipts in your own possession, would it be found out?

Witness:—I thought that people might want to examine my books and papers, and come and ask me what those Japanese documents were.

His Honour:—If persons coming to your books could find out from them that you were dealing in *satsu*, how could the destruction of the receipts benefit you?

Witness:—I found I was so involved, and thought by destroying them no one would have found it out. The books are not marked speculations in *kinsatsu*. (Referring to led. fol. 1:) I think there are some amounts in the page before me which refer to other amounts drawn than for losses in *satsu*. The figures in his column (pointing to book) are references to the journal. On referring to page 40 of the journal from page 1 of the ledger, I find the amount of \$300 (the entry of Dec., 1878) was sent to San Francisco in payment for goods. All the rest of the items on ledger page 1, are for payments for *satsu*. The \$300 is a payment of a personal debt. I do not know if the reason that that is the sole debt that is put there is because it is a personal account. Those entries following the \$300 were not all made in one day—they are all different dates. I could not show where the other entries for *satsu* are—my boy may have forgotten to enter them. He forgot to make entries of a good many items, such as money sent away. The receipts I destroyed were on Japanese paper and in the Japanese language. I think this first item in the ledger (Dec. 26, 1878—40—\$300) was written by my nephew,—and all the rest by my son. My nephew is older than my son. After my son came, my nephew stayed a couple of months with him at the books, and showed him about them. I believe that the loss of \$1,000 in speculations previous to December, 1879, is entered somewhere else in the books. I can make out a statement with the aid of my son and my nephew.

The Court here adjourned until 10 a.m. on Tuesday, June 22nd. The books were ordered to be left in Court. Mr. Hill to give written notice of such abstracts as he would want on re-assembling, and the Court to have them prepared by an officer of the Consulate.

#### AT THE PLAY IN JAPAN.

We had made several ineffectual attempts to get into the little theatre at Yokohama. It was always crowded to the very threshold, and the breathless, eager-eyed Japs. dovetailed together in the most extraordinary way that each might get a view of the fascinations of the stage, never vouchsafed even a glance of interest at the intrusive foreigners. It began to appear that thus much of the Japanese elephant must remain unseen. When, therefore, the professor wrote from Tokio, twenty miles away, "I have succeeded in securing a box at the Imperial Theatre for Thursday of next week," the amount of red tape implied was lost sight of in the keen satisfaction the news gave. But, as we bowled once more through the magnificent distances of picturesque, most-lined Tokio, going endless miles to reach a theatre, the professor explained it all. Theatre-going in the Land of the Rising Sun is a complicated affair. Your Japanese would disdain the comfortable simplicity of our style of doing business. The very complexity of detail involved in giving his family a day at the theatre is a part of his enjoyment. Do you think he would go to the box-office, pay his way, and walk in? Or tip the usher for a seat if he had not reserved one? Or take his chance at getting one without the tip? Not so. He opens negotiations with a tea-house. The street whereon the theatre is situated is lined with them, and banners of fanciful colors and various devices float from their balconies and proclaim the accommodation they have to offer. The proprietors of the tea-houses secure all the seats in the theatre, and then retail them to their patrons—quite after the manner of speculators in our own country. The tea-house figures conspicuously in the day's enjoyment, for play-going is an all-day affair; and as the Japanese takes a vital interest in the drama, he makes a day of his pleasuring. The tea-house furnishes his *chow* for the ten or twelve hours of his stay at the theatre; and, as your Japanese can eat with a frequency positively alarming to civilized barbarians, this is a most important item. At the tea-house, also, are to be procured *saki* (rice liquor) and tobacco. Also, if, worn out by the emotions of their very stirring dramas, he desire a *siesta*, he may retire to his tea-house and drone away an hour on the soft mats.

All this preparatory information served well when the professor turned the funny little Japanese pony's head into a narrow street full of tall (two-storied) tea-houses, whose flying banners gave the little thoroughfare a festival-day look. There was a tremendous clatter of voices and clogs, and the rattle of the most bric-a-brac-looking porcelain, as the Japs from the various tea-houses went by, laden with *chow* displayed in the most appetizing as well as high-art style. The graceful *bette*, flying ahead like an oriental

Mercury of new and quaint design, cleared the way with his shrill, peculiar cry, and we dashed up to the very threshold of the last tea-house in the line. It is easy enough to drive up to the threshold in a native town, for the streets are ridiculously narrow, and there are no sidewalks, but these same thresholds are nearly a yard above ground, so that *jinrikishas* and tramps may not absolutely get into the house.

An old crone with ebony teeth and shaved eyebrows took possession of us, with that effusive cordiality peculiar to Japanese women, and desired to fortify us with some tea and *chow*; but we were in too great haste to witness the novel spectacle to wait for *chow* just then, so we promised to return between the acts. She sighed, and entreated the professor not to forget to show the foreigners where General Grant, the American Mikado, had sat. A bevy of bright-eyed little Japanese waitresses hung about us with more soft entreaties on the *chow* question. They, too, sighed their regrets, with a politeness and insincerity truly French in its style; then one by one whispered to the professor in the softest Japanese—and a beautiful language it is, as spoken by the women and children—not to forget to show us where General Grant, the great American Mikado, had sat.

A big, blue-cotton-clad chap came rattling across the street, in his tall clogs, to take charge of us. We were ushered through a dark passage, filled with strange articles, which the professor declared to be the properties of the theatre. We were then shot up in some inexplicable way to the top of a staircase built on a vertical line; and when we had recovered our breath and got over our amazement at our climbing powers, we were already seated in a box in the Shinto Miza Theatre of Japan. What a queer-looking place it was, to be sure, filled as it was from floor to roof-tree with those dark, intent faces, and queer-looking heads. Like everything else in the seaboard towns, it is not a distinctively Japanese structure; but it has been built to suit the peculiar habits of the people, and there is not a seat in the house.

Our guide did not forget to whisper, as he softly withdrew, that it would be well to show us the place where General Grant had sat—and we fell to a contemplation of the hallowed spot. It was just in the middle of the gallery—which had been made aristocratic for the occasion—and the sacred spot was occupied just now by just such an element as fills our galleries at home. All applause seemed to come from the gallery. The applause itself is of a most peculiar character, and as much like a lengthened grunt of disapproval as any other sound of civilization; but it is an inspiration to the Japanese actor. Aside from the gallery the entire is laid out in little square boxes. In the pit these boxes are below the level of the aisles or passage-ways; and it is a funny sight when the little people clamber in and out of them. Our box was on the jutting balcony, and we looked up in the most conspicuous manner above everything around us; for the tea-house had provided us with chairs, recognizing that we had not been trained to sit in our heels. In consequence of the barbaric use of these articles of furniture, there were but three of us able to get into the box at a time, while all around us families of six and eight fitted in quite comfortably. They go to the theatre in families. Every one loves the drama; and every one, down to the babies, is acquainted with the history and traditions of the country, upon which all their plays are founded. In one box adjoining ours there were at least three generations, and this box was a type of all the others.

It was evident that great preparations had been made for the day. The hair-dresser had paid an extra visit, for every head was sleek and shining. Bits of bright new crape, and a more gorgeous cluster of hair-pins, testified to the extraordinary interest of the occasion. The hair-pin is the Japanese woman's sole article of jewelry. Bracelet, or ear-ring, or pin—nothing is pinned in Japan—has she none. The bangle is an unknown mystery to her. The diamond solitaire she has not even dreamed of. She lavishes all on her *obi*, or sash, and her hair-pins. I know of a little cook in Japan who toils for seven yen a month, but will unhesitatingly spend twenty-five yen on an *obi*, and who laughed one day with the most goodnatured disdain when her coral-tipped hair-pin was admired, because the coral was only beef-bone colored. They are not so very different from their diamond-decked sisters on this side of the pond. At the theatre there was a great showing of hair-pins and *obi*. The women, and for that matter the men too, seem all to be dressed alike at first glance, for every one in Japan wears blue. It is the national color for those who walk abroad. But it has half a hundred different shades, and the only difference between a rich man's goods and a poor one's lies in the texture. They are of one cut and style. But while the people in the gallery, and many in the pit, wore blue cotton, those in the balcony boxes were, one and all, dressed in silk or crape. The rich tones of the richer materials harmonized well with their dark-tinted skins, and one could see that they took an especial pride in their collars, which are always of finer material than the body of the *kimono*, a long-sleeved, sack-shaped, almost seamless garment, which is the universal wear.

Men and women smoked incessantly. Intent as they are upon the play, they do not forget almost unconsciously to roll their tobacco into the little pills which fill their tiny pipe-bowls. They are exceedingly impressive audiences, and melt to smiles or tears with a readiness most flattering to an actor. They have a merry, light little laugh which flutters all over the house in the pleasantest way when the actor points a joke. When he promises to become pathetic they pull out their little blue cotton squares, and prepare to weep. In a moment the big tears roll out of their soft black eyes, and a subdued sobbing may be heard here and there. But their emotions are evanescent. When the curtain falls, and the waiters come in with the *chow*, they fall to at the rice or fish served up on "old blue" with a will. As for the tea-pot, it is kept in the box all day, and filled at frequent intervals by the attentive waiters. There is much rushing back and forth between the acts. There is a grand exodus of all who do not stop to eat. You will see pretty

girls of fourteen, sixteen, or eighteen, brilliant with cosmetics, ambling to the door with their funny little gait, to exchange confidences with some young friend whom they have signaled across the house. You may know what they are talking about, for it is the custom to fall madly in love with the actors. The highest classes do not patronize the theatre. It is a plebeian form of entertainment. But the masses place the actors on such a pinnacle of popularity that we could quite understand the stratagem of the "supes" and minor actors whose dressing-room is in the front of the house among the properties. We had seen them in various stages of make-up—for the cosmetic art has attained a high degree of perfection in Japan—as we passed up the eccentric staircase. They go up the aisle, straight through the audience, to get on or off the stage; but this long walk is taken in a high-art style which is something delightful.

As for the stage itself, it is, as all the world knows, a revolving stage. That in the Imperial Theatre contains, perhaps, three sets; and it would not be necessary to lose any more time than in Steele Mackaye's Madison Square Theatre. But the *rai-act* is an institution with the people. They like it. They enjoy the play too much to desire to see the end of it. They are never in a hurry. If a Japanese ever does get in a hurry, he dies. His little frame cannot stand the wear and tear of such a new and utterly absurd emotion. The play itself would exhaust a foreigner if he sat it through. There is so much *hanashi* and so little action. This is a realistic effect. If a Japanese is going to do anything, the amount of talk involved in the doing of it is something formidable. All their effects are realistic, consequently it is almost as interesting to visit a Japanese house as to witness a Japanese play. Their stage settings cannot be magnificent because their own settings are not magnificent. Their costumes have not the gorgeous effect of Chinese stage costumes because the Japs themselves do not wear them. There is ease and comfort inexpressible in Japan, but there is no luxury. A Japanese interior setting would be interesting to a foreigner if he were not fresh from seeing twenty just like it. The sole piece of furniture in a Japanese room, aside from the omnipresent screen, is the *hibachi*, or fire brazier. If they are going to eat, the little tables are brought out of the closets. If they are going to sleep, the quilts are brought out of the closets. If they enjoy the possession of what we call "curios," they bring them out only one or two at a time. Thus they change their decorations every week. What would they think of the stage-setting of one of our interiors! Their garden scenes are exceedingly pretty, and the stage is at times interesting, for that it revives old dresses, customs, and articles of use now superseded: the *kyugo*, perhaps, or the *surimono*, a couple of basket conveyances, which have now given way to the universal *jinrikisha*, or other articles of this kind, which are interesting because they belong to the past.

The play for the day was *Kinuma's Itterenge*. We had hoped to see the *Forty Honins*—which may be called the *Hamlet* of Japanese dramatic literature—or, at least, something in which *kari-kari* would occur. They are said to give this with frightfully realistic effect. But it fell about that the play was but a mild one, though a tale of a sword—as all their tales are for it matter—and it contained an infinity of domestic detail. However, we saw the "Danjoro"—the Booth, so to speak, of Japan—and a capital actor the fellow is. He sinks his own name in this title of "Danjoro"—a proud one, since it signifies that he is the first player of the realm. He is handsome, in a Japanese way, and with the aid of cosmetics, is the type of Japanese manly beauty. His nose is long and slim, his eyes slanting, and his eyebrows half-way up his brow—a thin, well-defined, sloping line. His queue is of marvelous glossiness, and he is quick and lithe as a trapeze artist. They have a stilted stage language in Japan as well as at home, and he measures his syllables with most stately incidences. Throughout the long, long, longiege of talking, which preceded any action whatever, the audience hung upon his words with attentive ears, and gazed on him with rapturous eyes. The language itself abounds in quips and quibbles (as Gilbert would say), and the people are inveterate punsters. They prize a *wat* as dearly as did any of Mürger's Bohemians, and a good story or a witticism easily passes into history.

Doubtless this explained the people's enjoyment of the "Danjoro's" *hanashi*. As the actor, like every one else, sits on the floor on his heels—through more than one-half the time, the performance has not an enlivening effect. But when they do begin to act, they are as quick and agile as monkeys. Their fencing bouts are the most spirited encounters that can be imagined, and an actor of the highest degree studies to give a quickness and finish to his every motion. Thus, at one time, an old priest—in the play—with shaven crown and solemn mien, walked slowly through the queer little door of exit, and appeared about to pass to a *kyugo*—a basket of the sedan-chair family, but absurdly small. He was tall for a Japanese, and his height was augmented by the pair of clogs into which he solemnly climbed at the door—for no Japanese wears his shoes in the house. As he neared the *kyugo* he doubled himself into a ball and rolled into it, in the twinkling of an eyelash. Anything more quick and sudden I never saw. In fencing, or even in miscellaneous sword-fighting, they will revolve on their heels between the blows with astonishing quickness. There seems to be a gymnastic leaven leavening the entire dramatic lump.

An old comedian, who had been the favorite of the public for forty years, was one of the most interesting features of the stage. He came up the aisle with all the conscious pride of favoritism—as Warren might walk on a Boston stage, or Gilbert in New York, or Mrs. Judah in San Francisco. He looked the veteran of the stage, every inch of him. But he was the warrior for the nonce, not the comedian; and there were blended dignity and conscious pride in his acknowledgment of a clamorous greeting.

The female parts are all taken by men—as in the Chinese theatre. These men look immensely tall, for the Japanese women

are tiny creatures; but they imitate ridiculously well the little short, anbling, pigeon-toed steps, for it is the height of bad breeding for a Japanese woman not to walk with toes well turned in. Also, they dress their part with the greatest fidelity, and tune their voices to the female pitch. Japanese women have figured conspicuously in the history and literature of the country, but they do not dramatize the Japanese heroine extensively. They prefer bloody battles, feuds between the great *daimios*, and stories of long vendetta. *Kazuma's Revenge* is of this latter type, and the endless expedients to which a couple of Japanese *samurai* resorted to get the better of each other became tiresome through the fellows unpacking their souls too much in words before they fell to fighting. The "Danjoro" took a leaf from Clara Morris's book, and gave us a scene of physical suffering. He fell a-shivering with a chill. His jaws chattered, his teeth rattled, and he became actually livid with cold. They piled covering on him, but he shivered through it all until one actually pitied him, and it seemed impossible that it could not be real. Then the fever came upon him. His throat grew parched, his tongue thick, his eyes glassy. He tossed the coverings off impatiently, and began to rave. The illusion was quite as vivid as the first. Then, in a twinkling, he restored himself to his normal condition. It had been a play within a play. He had denied himself to a friend or enemy on plea of illness, and when the visitor forced himself in he was seized with sickness. The gallery granted a most forcible approval, and there was the glisten of warm commendation in the soft, dark eyes all around us.

One of the most peculiar features of a Japanese theatre is the scene-shifters, for there are several. They also act as property-men. Articles to be used are not discovered when the curtain rises. These imps of darkness bring them out, and put them in place as occasion demands. They are dressed in black from head to foot, mask and all, and are supposed to be invisible. It is rather startling to see them walking about among the players, although they try to be mysterious and retiring in their movements. Actors and audience are entirely oblivious, and I really believe the people have worked themselves up to such a point of imagination that they do not see them.

When the sun began to set we left the great audience—a Japanese theatre is always full—still enjoying themselves, and nowhere near the end. Several ushers glided up to point out the spot where General Grant had sat, as we prepared to fall down the steep staircase. We had been out between the acts, and had been entreated on various sides to observe the spot. His visit had really been a great occasion, and people were to be pardoned for remembering it. Thousands upon thousands of dollars had been expended upon each entertainment, and in the theatre such a performance had been given as will never be seen again in Japan. They dramatized for the occasion an old historical legend, whose hero, renowned for his valorous deeds, they likened to Grant. It was the most graceful compliment they could convey to a warrior. Actors and *grishas*, or dancing girls, were brought from far and near. The decorations were something fabulous. But are not all these things written?

I brought away my programme with me. It is a funny little buff pamphlet of rice paper. It begins at the wrong end, as everything does in Japan. The crest which ornaments it is on the last page instead of the first. The argument begins at the right-hand lower corner of the last page. It is profusely illustrated with grotesque-looking Japs in various stages of dramatic tribulation, but you must look at the last picture first. It is neither a very nice-looking, nor legible, nor intelligible document, but it brings back very vividly the interesting day when the professor sighed a big sigh of relief as we left what had become an old story to him. We took our last drink of tea and our last slice of bamboo root in the tea-house. We said "sayonara" half regretfully to the eyebrowless crone and her bevy of attending maidens. The professor shook the reins over the Japanese pony's banged mane, the *betto* set up his cry of warning in the little banner-lined street, and to the tea-houses, theatre, and General Grant, we gave a silent *sayonara*:—*BERRY B. in the Argonaut.*

### DOUBLE ACROSTIC.

When on my first my whole occurs,  
It's dreadful reckoned:  
Then frightened men and women do  
My trembling second.

1.  
This light you very soon will guess,  
Tis added to a man's address.

2.  
Dear friends at parting sigh and cry,  
And use this word to bid "good-bye."

3.  
This country's always blamed we know,  
For being England's bitter foe.

4.  
Carelessly work, you'll hit a nail,  
A rope—or turn—out for a sail.

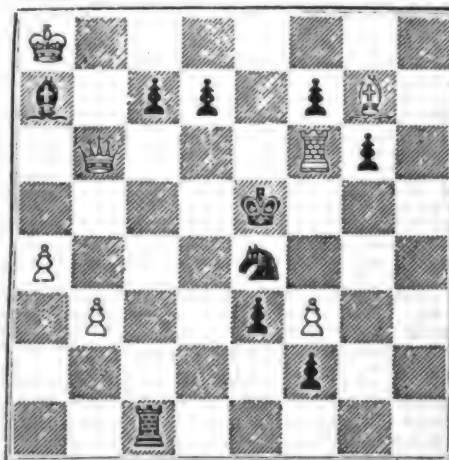

5.  
Blue and yellow, red or green,  
Of every color this light is seen.

SAYONARA.

### CHESS PROBLEM,

By J. MINCKWITH.

BLACK.

WHITE.

White to play and mate in three moves.

SOLUTION OF CHESS PROBLEM OF JUNE 4TH, BY W. H. TAYLOR.

### TELEGRAPH REPORT.

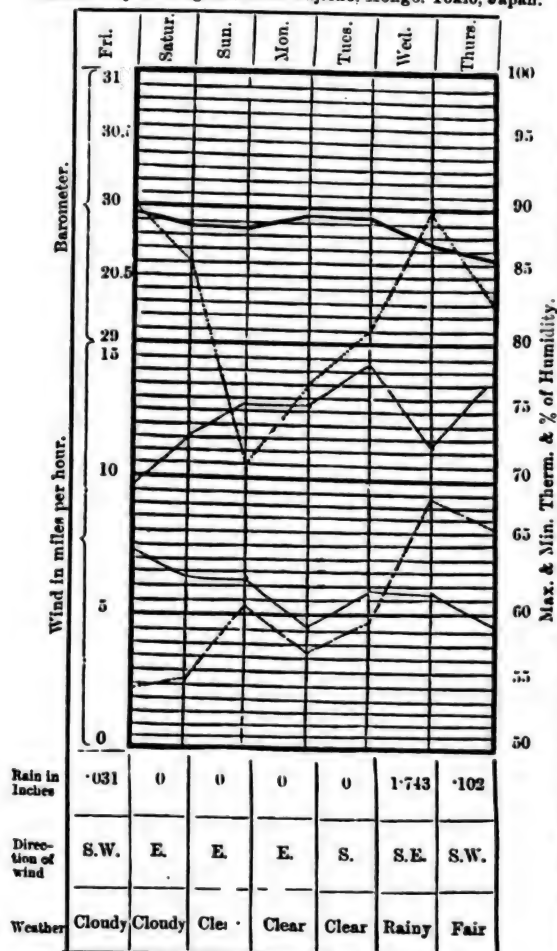

(Corrected to 9.30 a.m.)

All lines in working order.

## METEOROLOGICAL REPORT

FOR WEEK BEGINNING FRIDAY, JUNE 11TH, 1880.

Observatory of Daigaku, Moto-Fujicho, Hongō, Tokio, Japan.

## REMARKS.

Heavy line represents barometer.

Light continuous line—max. &amp; min. thermometers.

..... presents velocity of wind

.....percentage of humidity

Max. velocity of wind 20 miles per hour on Wednesday, at 8 p.m.

The barometer is reduced to the freezing point and to the level of the sea.

The highest reading of the barometer for the week was 29.991 inches on Tuesday, at 7 a.m., and the lowest was 29.603 inches on Thursday, at 7 a.m. It will be seen that the barometer has been uniformly low throughout the week, not having touched the height of 30 inches. The total amount of rain for the week was 1.845 inches, being nearly three times as much as fell during the corresponding week of last year. But the greater portion of this fell in one day, the amount for Wednesday, the 16th, being 1.743 inches.

## SHIPPING INTELLIGENCE.

## INWARDS.

- June 12, Japanese steamer *Tsuruga Maru*, Steedman, 661, from Kobe. Mails and General, to M. B. Co.
- June 13, Japanese steamer *Shinagawa Maru*, Walker, 908, from Samusawa, General, to M. B. Co.
- June 14, American steamer *City of Peking*, Berry, 5,079, from Hongkong, Mails and General, to P. M. Co.
- June 14, French steamer *Volga*, Guirand, 1,502, from Hongkong, Mails and General, to M. M. Co.
- June 14, French corvette *Champlain*, Captain Michaud, 1,950, from Nagasaki.
- June 16, American barque *Cygnar*, Hanson, 296, from Vladivostok, Ballast, to Walsh, Hall & Co.
- June 16, French corvette *Thémis*, Captain Alguier, 3,800 tons, 18 guns, 1,000 H.P., from Kobe.
- June 16, British despatch-vessel *Vigilant*, Lieut.-Commander Annesley, 985 tons, from Kobe.
- June 17, Japanese steamer *Genkai Maru*, Coomer, 1,260, from Shanghai and ports, Mails and General, to M. B. Co.
- June 17, Japanese steamer *Kinamoto Maru*, Drummond, 1,240, from Funagawa, Mails and General, to M. B. Co.
- June 17, Japanese steamer *Wakana Maru*, Christenson, 1,343, from Kobe, Mails and General, to M. B. Co.

- June 17, Japanese steamer *Shurio Maru*, Kilgour, 524, from Kobe, Mails and General, to M. B. Co.
- June 18, British steamer *Pearlo*, Cain, 652, from Newchang, Beans, to Chinese.
- June 19, British barque *Roderick Hay*, Nickolson, 290, from Takao, Sugar, to Chinese.

## PASSENGERS.

Per American steamer *City of Peking* from Hongkong:—Mrs. C. D. Harman and servant. For San Francisco: J. Bremner, R. A. and 379 Chinese.

Per French steamer *Volga* from Hongkong:—From Marseilles:—Messrs. Naumann, and wife, Nagasaki, Suzuki, Kinzo, Kobe, Brandel, and Brand. From Naples: Mr. B. Marmont; and from Hongkong: Mr. Donsdebes.

Per Japanese steamer *Genkai Maru* from Shanghai and ports:—Mr. C. H. de Groot (Belgian Minister), Baron Westenhof, Capt. Hill, Dr. Bransford U.S.N., Mr. and Mrs. C. Blethen, Messrs. H. Winniberg, J. J. Henderson, W. H. Luther, E. P. Hague, C. M. Dyce, A. Silverthorne, E. Boninger, R. D. Robinson, G. Beit, H. Blum, J. A. Thompson, Mo-wop, Foster, Ito, Hanao, Matsura, Koinishi, and Mr. and Mrs. Hori in cabin; 3 Europeans, and 203 Japanese in steerage.

## OUTWARDS.

June 14, Japanese barque *Samunoura Maru*, Spiegenthal, 925, for Nagasaki, General, despatched by M. B. Co.

June 14, British barque *Pym*, Stapleton, 743, for Kobe. Part of original cargo from Antwerp, despatched by Simon, Evers & Co.

June 14, British steamer *Garlic*, Kidley, 2,652, for Hongkong, Mails and General, despatched by O. & O. Co.

June 14, British steamer *Harter*, Branthwaite, 1,396, for New York, Tea, despatched by Smith, Baker & Co.

June 14, Japanese steamer *Tokai Maru*, Hogg, 652, for Kobe, Mails and General, despatched by M. B. Co.

June 15, British 3-masted schooner *Ching Too*, Beckie, 304, for Amoor River, despatched by Walsh, Hall & Co.

June 16, Japanese steamer *Hiogo Maru*, Moore, 896, for Hakodate, Mails and General, despatched by M. B. Co.

June 16, Japanese steamer *Tsuruga Maru*, Steadman, 661, for Nagasaki, General, despatched by M. B. Co.

June 16, Japanese steamer *Takamago Maru*, Young, 1,230, for Shanghai and ports, Mails and General, despatched by M. B. Co.

June 17, British steamer *Sunda*, Reeves, 1,029, for Hongkong via Nagasaki, Mails and General, despatched by P. & O. Co.

June 18, British ship *Kilkerran*, Lowe, 1,200, for Nagasaki, Kerosene, despatched by Frazer & Co.

June 19, American steamer *City of Peking*, Berry, 5,079, for San Francisco, Mails and General, despatched by P. M. S. S. Co.

June 19, British steamer *Oxfordshire*, Jones, 1,236, for Kobe, General, despatched by Smith, Baker & Co.

June 19, Japanese steamer *Shinagawa Maru*, Walker, 908, for Hakodate, Mails and General, despatched by M. B. Co.

June 19, Japanese steamer *Togoshima Maru*, Hubbard, 698, for Kobe, Mails and General, despatched by M. B. Co.

## PASSENGERS.

Per British steamer *Sunda* for Hongkong via Nagasaki:—Mr. and Mrs. G. Giarretto and 2 children, and Messrs. M. Ito, and T. Tokuda in cabin; 2 Chinese in steerage.

Per American steamer *City of Peking* for San Francisco:—Messrs. Geo. Denton, A. Woodhouse, Mr. and Mrs. W. A. Crane, infant and 5 children in cabin. For New York:—Mr. and Mrs. G. R. Davis and 2 children. Mr. and Mrs. Clark Blethen, Captain and Mrs. J. M. Snow, Dr. J. F. Bransford, U.S.N., Mr. and Mrs. D. Cryder, infant and servant, Miss Priest, Miss Wilson, Messrs. W. H. Luther, E. P. Hague, Edward Potter, L. R. Wynter, D. H. Marshall, John Thomson, Geo. Thomson, C. A. Davenport, and Bremner in cabin. For Liverpool:—Capt. G. B. Hill, Dr. and Mrs. J. M. Strachan, Messrs. Edw. Wheely, C. M. Dyce, S. Skalkowsky, and R. E. Peake in cabin. For London:—Mr. W. Shippeny Hall in cabin.

## CARGOES.

Per French steamer *Volga*, from Hongkong:—From Europe, 2,322 packages; 613 packages from Hongkong, and 274 packages for Kobe.

Per Japanese steamer *Takamago Maru* for Shanghai and way ports:—Treasure... \$360,200.00

Per American steamer *City of Peking* for San Francisco:—

**SUGAR.**—During the past week, sales have been made at from \$4.20 to \$4.10. Prices close firm at quotations.—Stock 80,000 piculs.

**KEROSENE.**—The *Kilkerran* has arrived from Anjer with 44,000 cases, of which cargo she has discharged about one-half, and has proceeded to Nagasaki with the remainder. Prices are a shade weaker, owing to large stocks and several vessels being overdue here and in Kobe.

Sugar:—Takao in bag ... per picul	\$4.15 to \$4.20
Taiwanfou in bag ... ..	\$4.10 to \$4.15
Ching-pak and Ke-pak ... ..	\$3.00
China No. 4-5 Kongfun & Kook-fah ..	\$6.00 to \$7.50

Daitong ... ..	per picul... \$4.00 to \$4.40
Japan Rice ... ..	" .. \$2.90 to \$3.15
Kerosene Oil ... ..	case .. \$1.62
Newchwang Pass ... ..	picul ... \$2.00

**EXPORTS.**

**SILK.**—The Silk market has been very depressed during the past week. It may now be considered certain that large crops of Silk have been produced in Europe, China, and Japan, and the markets are consequently everywhere weak.

Under the circumstances, it is impossible to give reliable quotations, the only guide we have being a few trifling sales, as follows:—

Hanks, Sinchu, about 2½ at.....	\$350=186
Filatures, about No. 1½ at.....	\$650=219
Kakeda, good to best.....	\$630=21/ }

In London at exchange of 3/9½.

Stock in Yokohama, 1,260 shipping bales.

Shipments to date 17,776 bales against 19,066 bales at the same period last season.

The first bales of new Silk arrived in Yokohama yesterday.

	In London at 3/10 per lb.	In Lyons at fr. 4.88 per kilo.		In London at 3/10 per lb.	In Lyons at fr. 4.88 per kilo.
Hanks,—Superior, nom...			Kakeda,—Extra .....	\$700 to 730 24/ to 25/	frs. 68 25 to 71 00

**SHIPPING.**

**SHIPPING.**—The ship *Sumatra*, from Hongkong to San Francisco, has put in here through stress of weather and is discharging part of her cargo. The *Pym* has gone to Kobe with part of original cargo. The *Chingtoo* has been taken up for the North of Japan. The steamer *Penedo* is in port from Newchwang under Chinese charter.

## MISCELLANEOUS.

## NOTICE TO MARINERS.

No. 118.

## CHINA SEA.

## SWATOW DISTRICT.

## CAPE OF GOOD HOPE LIGHTHOUSE.

NOTICE IS HEREBY GIVEN that the Cape of Good Hope Light was exhibited for the first time at sunset of the 28th instant.

The illuminating apparatus is Dioptric of the Fourth Order, shewing a *fixed red* light from S. 32° E. to S. 10° E., a *fixed white* light eclipsed for about 4 seconds every minute from S. 10° E. round by S. and W. to N. 8½ E. and a *fixed red* light eclipsed for about 4 seconds every minute from N. 8½ E. till it is shut in by Ma-urh Point. The bearings are magnetic and from seaward.

The Light is elevated 171 feet above the level of the sea, and in clear weather, the *white* light should be visible at a distance of 15 Nautical miles and the *red* light at 8.

The tower is round, of iron, 10 feet high and with a total height from its base to the lantern vane of 22 feet.

The tower, dwellings and boundary wall are painted white.

Approximate position :—Latitude,..... 23° 14'.  
Longitude, .....116° 47'.

By order of the Inspector General of Customs.

DAVID M. HENDERSON,  
Engineer-in-Chief.

Imperial Maritime Customs,  
Engineer's Office,  
Swatow, 31st May, 1880.

## SUGAR LOAF ISLAND LIGHTHOUSE.

NOTICE IS HEREBY GIVEN that the Sugar Loaf Island Light was exhibited for the first time at sunset of the 29th instant.

The illuminating apparatus is Dioptric of the Sixth Order, shewing a *fixed white* light varied by *red* flashes at half minute intervals and visible all round.

The Light is elevated 200 feet above the level of the sea, and in clear weather, it should be visible 8 Nautical miles.

The tower is round, of iron, 9½ feet high and with a total height from its base to the lantern vane of 21½ feet.

The tower and lantern dome are painted red and the dwellings white.

Approximate position :—Latitude,... 23° 19' 8".  
Longitude, 116° 44' 25".

By order of the Inspector General of Customs.

DAVID M. HENDERSON,  
Engineer-in-Chief.

Imperial Maritime Customs,  
Engineer's Office,  
Swatow, 31st May, 1880.

## MATSUKI-NO-KAMI,

BEGS to inform the public that she has resumed charge of her former property,

## THE GREATEST

WONDER OF MODERN TIMES  
HOLLOWAY'S PILLS.

Persons suffering from weak or debilitated constitutions will discover that by the use of this wonderful medicine there is "Health for all." The blood is the fountain of life, and its purity can be maintained by the use of these Pills.

SIR SAMUEL BAKER,

in his work entitled "The Nile Tributaries in Abyssinia," says, "I ordered the dragoman Mahomet to inform the Faky that I was a Doctor, and that I had the best medicines at the service of the sick, with advice gratis. In a short time I had many applicants, to whom I served out a quantity of Holloway's Pills. These are most useful to an explorer, as possessing unmistakable purgative properties they create an undeniable effect upon the patient, which satisfies him of their value."

SIMPLE, SAFE AND CERTAIN!  
HOLLOWAY'S OINTMENT.

Is a certain remedy for bad legs, bad breasts, and ulcerations of all kinds. It acts miraculously in healing ulcerations, curing skin diseases, and in arresting and subduing all inflammations.

MR. J. T. COOPER,

in his account of his extraordinary travels in China, published in 1871, says—"I had with me a quantity of Holloway's Ointment. I gave some to the people, and nothing could exceed their gratitude; and, in consequence, milk, fowls, butter, and horse-feed poured in upon us, until at last a tea-spoonful of Ointment was worth a fowl and any quantity of peas, and the demand became so great that I was obliged to lock up the small remaining stock."

Sold by all Chemists and Medicine Vendors throughout the World May 17th, 1879.

"HIGHEST AWARD & PRIZE MEDAL PHILADELPHIA

EXHIBITION, 1876."

PREPARED EXPRESSLY FOR THE PATENT KNIFE-CLEANING MACHINES, INDIA RUBBER AND BUFF LEATHER KNIFE BOARDS. KNIVES CONSTANTLY CLEANED WITH IT HAVE A BRILLIANT POLISH EQUAL TO NEW CUTLERY. PACKETS 3D. EACH; AND TINS, 6D., 1/-, 2/6 AND 4/- EACH.

PREVENT FRICTION IN CLEANING AND INJURY TO THE KNIFE. OAKEY'S WELLINGTON KNIFE POLISH SHOULD BE USED WITH HIS BOARDS.

MATSUZAKA HOTEL,  
KIGA,  
(Hakone Hot Springs.)

Yokohama, July 19, 1879.

W. & A. GILBEY'S  
WINES AND SPIRITS.

W. & A. GILBEY have special facilities for carrying on an extensive Foreign Trade, having held for many years in their Excise Licensed Stores, for the purpose of their Home Trade, a stock of not less than 12,000 Casks of Wines and Spirits, which are equally available for Export. These stores are by far the largest private Duty Free Warehouses in the World, and are under the supervision of a staff of Excise Officers specially attached to these Warehouses.

THE EXTENT of W. & A. Gilbey's purchases enables them to give the best VALUE to the public, as a twentieth part of the Foreign Wines consumed in the United Kingdom is supplied from their stock. In the year 1876 W. & A. Gilbey paid duty on 1,881,049 gallons of Wines and Spirits, and the average quantity bottled and sent out by them daily was 3,050 dozens or 36,600 bottles.

QUALITY is guaranteed by W. & A. Gilbey, and is the same whether the Wines or Spirits are obtained direct from their Head Establishments or from any of their Agents. The purity and genuineness of every article in this list are guaranteed in accordance with Act of Parliament, 38 and 39 Vict., Cap. 63.

W. & A. Gilbey have always adhered to the standard of Bottle Measure recently recognised by the Government, namely—

6 bottles contain one gallon; 12 half-bottles contain one gallon.

SECURITY is ensured to the purchaser, each bottle bearing W. & A. Gilbey's seal and label guaranteeing quality and measure, and the strength also in the case of Spirits.

## JAPANESE JOURNALISM.

ABOUT four years ago appeared for sale, in the streets of London, a reprint of the *Times* newspaper as it was first issued in its earliest form of publication. Apart from the general interest which this republication had, as shewing a page of exciting events now part of past history, it gave a true idea of the small beginnings from which this large and notable journal had grown to its present size and importance. Since these earlier days the organization of what may be called the science or mechanism of journalism has made such rapid strides that we are apt to forget the humbleness of its origin, and to look disparagingly upon the inferior journals of countries which have more recently adopted the daily press, among other modern utilitarian introductions. Our larger newspapers, whose columns are now supplied by a complete system of agents and reporters in all corners of the country, and correspondents in all parts of the globe, were of but small dimensions and of meagre contents not long ago.

Journalism in Japan is a comparatively new institution, and, consequently, we cannot expect to find in it by any means the completeness or perfection that it has attained in Europe. It is, however, undoubtedly a most popular novelty. Whilst many foreign introductions into this country, undeniably of benefit to the community, continue to be regarded with dislike by a large portion of the public, there are others whose advantages would never be disputed even by the most ignorantly conservative and anti-foreign of any class of the people. Even by the most superstitious of the lower classes an eager appreciation is shewn of the daily paper, as well as other conveniences, such as the cheap

post and telegraph services. An exquisite relish for news and gossip, more palatable if it be seasoned with scandal, creates many buyers for certain journals, who would not be seduced into a thirst for information conveyed in any other form. It would be possible, by elevating the tone without destroying the character of such papers, gradually to allure and educate the ignorant, in the same way as historic events may be made more attractive to the young in the form of historical romances. But, however indirectly educational periodicals of this kind may be to those who have little other opportunity of acquiring knowledge, it cannot be expected or supposed that they are issued with any such view. It is plain that the object of publishers will be to create as wide a sale as possible by pandering to the tastes of the majority of buyers: it moreover follows that an advance in the tastes and requirements of the general reader, who helps to create the demand, would bring about a corresponding improvement in the style of the production. The progress of the newspaper press must be one and the same with the progress of the people. It is necessary that a government should exercise a wise control in suppressing disloyal or immoral writings; it cannot be expected, however, that the whole of the daily press should assume a high-class educational position, or that it should represent in its writings the kind of matter cherished by the more cultured, and the leaders in national improvement.

An examination of the best daily papers will discover very serious and instructive matter. In the case of such journals as the *Nichi Nichi Shimbun*, or the *Mainichi Shimbun*, it must not be supposed that the translations given in the foreign papers represent fairly the general style of their writings. These extracts are generally the *crème de la crème*, taking up but a small space in their pages, otherwise filled with trifling circumstances and gossip of the lightest description. In surveying the several hundred newspapers which are produced in Japan, of which a large proportion are published in Tokio, we shall find that they naturally divide themselves into several different classes. That class which makes special reference to Government matters may be considered to be fairly represented by the *Kinji Hiron*, the *Nichi Nichi Shimbun* and the *Choya Shimbun*. Of these the first is of a small pamphlet size, and though mostly favourable to the Government, is generally outspoken and has the reputation of giving the general educated public opinion. The *Choya Shimbun* preserves a tone more or less opposed to the Government, and is noteworthy as having been twice suppressed on account of indiscreet utterances. This and the other larger papers consist of a double sheet of about folio size. For the most part they concern themselves with internal and local news, chiefly that of the capital and neighbouring port of Yokohama. Correspondence from Japanese in foreign parts occasionally appears; but as a rule the foreign news is scarce and unimportant.

One paper, called the *Fu Ken Shimpō*, professes to

contain provincial news from the principal Fu and Ken, having reference to the affairs of local government and events.

One curious little periodical, intended for the mercantile classes, and called the *Kane Tame no Hiden*, contains general advice upon modes of making money, and becoming healthy, wealthy and wise. Superstitious notions are curiously blended with practical hints, the number before us commencing with an old Chinese proverb, followed by a sketch of a merchant worshipping before the god of wealth; the letter-press following being more in the form of a discourse than of items of news.

The religious periodicals may be fairly represented by the *Mioho Shinshi*, treating of matters connected with the popular religion of Buddha. It gives both marvellous stories from the history of the religious orders, and also modern wonders and instances of successes and temporal blessings vouchsafed to believers. The chief of the comic papers is the well-known *Maru Maru Chimbun*, containing cartoons, sketches and jokes after the style of "Fun" or "Judy." The Japanese joke, however, differs essentially from forms of western humour; and few translations would be able to give an idea of the nature of amusement conveyed in local comic productions. In many cases the meanings are very deep and much is left to the imagination: sometimes the jokes are political, and then the names are suppressed, generally some play upon the name being employed. An instance of the sarcastic humour sometimes contained in the periodical may be taken from a number in which appeared a drawing of a Chinese grass called *ran*, below which it was stated that, owing to the fashionable rage for this specimen of foreign horticulture, the population had wasted a great deal of money. This appeared at the time of General Grant's visit, he being called by the people "Gran San" or sometimes "Ran San." By the *Maru Maru* editor is published another comic paper, called the *Kibidango*, in which the references are less political and more personal. Another journal, containing amusing songs and sketches, is the *Tenkito Supponchi*. Passing events generally obtain a humorous comment in Japan, as in other countries, in the form of new songs and sayings, retailed chiefly by the actors, and the *geisha* with their *samisen* accompaniments. The *Tenkito Supponchi* gives a collection of such novelties.

The *Horitsu Mondo* is a newspaper which confines itself chiefly to sensational news connected with the police and law courts.

There are others intended more especially for the perusal of the lower classes and containing chiefly news of the theatres, singers, dancers, and *demi monde*. Among them may be noticed the *Tokio Jiyu Shimbun*, the *Ukiyo Shimbun* and the *Doraku Sotan*, as well as papers such as the *Yomi Yori Shimbun* and the *Kana Yomi Shimbun*, mostly read by women. These also assume a more or less humorous tone, summing up with some joking reflection upon events recorded. One little paper called the *Tokio Shinshi*, records the various pleasure sights and scenes which take place in the capital, such as the flower shows and outings fashionable at various seasons. In this a high class style of writing is preserved, the *kana* being little used.

In addition to these may be noticed the educational periodicals, of which there are several. One called the *Kogyo Shimpō* is an engineering paper: there are others upon chemical and physical subjects, and one that might be called a *School News*, containing information with reference to the various schools and colleges. We have hitherto only mentioned those papers published in

Tokio; there are, however, some two or three hundred published in the various provinces and chief towns of the country. For example, there is the *Sendai Nichi Nichi Shimbun*, giving the news and business of Oshiu, as well as reports of events at the capital. It contains also tables giving the state of the tea, rice and money markets.

For reasons that we have before stated, it cannot be expected that even the best of the newspapers here enumerated should give a fair idea of the views of the most enlightened of the people, and of those to whom the country has to look to lead it in its future progress. By such men, who are mostly sufficiently conversant with some foreign language to look for instruction and information among the best periodicals of other countries, many of the narrow-minded sentiments will be read with a smile. Yet for many the newspaper press, even as it now exists, is an inestimable boon. The nursery tale of the ugly duckling, which imagined for some time that the whole world was bounded by its farm-yard—until it at length plumed out into the snowy beauty of a full-grown swan and sailed up the river into distant parts—may be taken as a parallel of the state of many of the middle and lower classes. Many too old to take advantage of modern educational opportunities and thinking their own island the world,—with no notion of geography, universal history, or any explanations of such supernatural phenomena as *jiehin* or *kaminari-sama*, are gradually being informed and enlightened by the daily papers, which they read with avidity. With an advance in the scope of the public mind, the tone of the public periodicals will undoubtedly improve.

#### JAPAN'S RIVALS IN TEA-GROWING.

FROM various parts of the world come cogent warnings against the adulteration of tea, and the inevitable loss of markets which must follow the practice. It is of the utmost importance that Japanese tea-growers and dealers should recognize the danger that they will incur if they attempt to increase their gains by fraudulent admixtures of inferior or spurious products with the article whose genuineness has attained and still preserves so enviable a reputation in the markets of North America. It must be remembered that there are many competitors for favour in this as in other branches of industry, and that there are large areas in several parts of the world suitable for tea-culture. Endeavours, as we have mentioned on previous occasions, have been made by no means unsuccessfully though yet with no definite system or perseverance, to acclimatize the tea plant on the slopes of California and other of the western states of America. Some economists in that region recommend increased attention to this pursuit, not at present so much as an all-absorbing industry, but as one which might prove ancillary to the more serious work of great farms, and provide some employment for the otherwise frequently idle family of the agriculturist. Granting, however, that there may not be much danger imminent in the near future that the local tea-production of America will threaten the stability of the market which is now principally supplied from this empire, and that even the development of similar undertakings elsewhere is not a serious menace, so long as the character of the article sent hence is sustained, it is advisable to bestow particular regard upon that one condition. And it is certainly not amiss to be acquainted with the places and conditions from which dangerous rivalry, in case of emergency, might be anticipated.

The matter of the tea-trade is receiving serious con-
